In regard of the whole sample (Table 2 – Panel A), for the greater part of the event windows examined, value creation for the shareholders of the involved companies is highlighted; however it is only statistically relevant in the event windows (-1,1), (-1,0) and (0,1), where the average CARs values

¹ It is not a case that companies such as Motorola, Fujitsu, GUS plc et al. are included in this portion of the sample.

² One must bear in mind that the stock week is formed by 5 working days; the essay is thus referring to the event window (0.5).

³ 5 operations were excluded from the counting as their publication date was later than the announcement date, and therefore cannot be part of the event window (0.5).

correspond to 1,34%, 1,04% and 0,59% respectively.

This result confirms Veld and Veld-Merkoulova thesis (2004), according to which the a spin-off announcement is received positively by the market, generating positive returns on average, especially around the date of the announcement, to then return to normal values in the following days.

By observing the spin off operations published on the *Wall Street Journal*, positive CAARs are found in all the event windows examined, except for symmetrical windows (-20, 20) and (-15,15); however, they only just become statistically relevant in the event window (-1,1), (-1,0) and (0,1), with a confidence level of 95% in the first two and of 90% in the window (0,1), identifying values equivalent to 1,23%, 0,91% and 0,73% respectively. The disclosure of the news by the press enhances the effect generated by a spin-off announcement, thus confirming Huberman e Regev results (2001).

(b) Percentage of companies with a positive CAR in the sample.

In reference to the results obtained the moment when news is disclosed on the *Wall Street Journal*

(Table 3), if the operation is subject to rumour (Panel A), positive abnormal returns will be on average remarked in all of the symmetrical windows following the announcement date, although they can be considered statistically relevant only in the windows (-1,1), (-1,0) and (0,1). Similarly to what occurs when considering whether news is published or ignored by the “Wall Street Journal” (Table 2 – Panel B), the effect produced by the spin-off announcement on the returns of the companies involved appears to be amplified if the press disclosed news on a date prior to the announcement. The same occurs for the spin-off operations published on the *Wall Street Journal* within a week of their announcement (Table 3 – Panel B): in the event windows (-1,0) and (0,1) both average and significant cumulative positive returns are displayed. The top and leading newspapers can influence stock trends without even providing any new information. The publishing of news concerning a spin-off operation, despite not being first-hand as it follows the operation announcement, still contributes to value creation for the shareholders.

These results confirm the first research hypothesis.

(a) The symbols *, **, and *** represent significance levels of 10%, 5% and 1% respectively

(b) Percentage of companies with a positive CAR in the sample.

Table 4 (Panel A) shows the estimated CAARs for those spin-off operations published on the *Wall Street Journal* on a date prior to the operation announcement, taking the date of news publication as the event date. As displayed in the event window $(-1,0)$, a positive CAAR - statistically significant - can be observed, with a confidence level of 95%: it thus seems that investors anticipated the spreading of the rumour by means of press, highlighting the presence of informed investors on the market. These results may also be interpreted as the revelation of insider trading activity. This may well be considered a plausible hypothesis, yet it does not seem likely. Insider trading usually occurs in secret circumstances (for instance, when negotiating small quantities repeatedly in time) in order to avoid abnormal variations on the stock returns that would expose the event to the market before its official announcement, and at the same time reveal to the authorities the unlawful activity.

In the event windows following the rumour publication date, value destruction arises for shareholders of those societies involved in spin-off operations. This result implies that, after the initial positive reaction (which anticipated the spreading of the news) as far as the investors are concerned, the shareholders react negatively to the publication of the rumour on the *Wall Street Journal*, judging it less reliable than the official announcement of the operation. Such reaction is confirmed for CAARs found also in the slot $(-1,0)$: the investors react in a significant manner to the publication of the rumour on the *Wall Street Journal*.

From the comparison between cumulative average abnormal returns, the announcement date of spin-off deal and the publication of the rumour on the *Wall Street Journal* (Table 4 – Panel B), it emerges that, in the symmetrical event windows with the exception of the event window $(-1:1)$, the spread of the rumour generates a supplementary-return. The average CAR displayed in the window $(-1,0)$ confirms such reaction: the investors respond in a significant manner to the rumor publication on the *Wall Street Journal*. Instead, in the following windows, it is the announcement that creates value for the shareholders. The investors in the phases following the information diffusion appear to place more confidence in the announcement, rather than in the publication of the rumour. This being an official statement, they feel “reassured” of the fulfilment of the operation. The spin-off deals news produces an impact on investors’ behaviour, not only when the rumour is published on the *Wall Street Journal*, but also when the operation itself is announced: yet, the reaction is more visible at the time of the publication of the rumour, as higher CAAR is achieved, compared to the time of the announcement.

The effect generated by the publication of the news on the *Wall Street Journal* on a date prior to the spin-off announcement is not entirely extinguished: indeed, at the time of the announcement, a positive abnormal cumulative return is, on average, distinguished, although it is less significant.

Some investors do not appear to be affected by the publication of the news on the *Wall Street Journal* as they place more confidence in the announcement of the spin-off operation.

6. CONCLUSION

The media is relevant to the process of news disclosure and circulation within financial markets. The moment in which news is disclosed may contribute to the formation of the investors' expectations on the returns of the subjects operating on the market, thereby improving the market's informational efficiency.

In the past few years, the media has put aside an increasingly significant space to corporate restructuring operations, chiefly to spin-off operations, that are back in fashion due to the financial crisis.

On one hand, the economic crisis uncovered companies' weaknesses on both the industrial and the financial level, on the other, it meant a chance for these very same companies to rethink their strategies and their internal structures in order to boost their growth and their competitiveness.

This study aims to assess whether the effect generated by the announcement of a spin-off operation on companies' performances can be amplified by the circulation of spin-off news within specialised press.

Using the database *Zephyr – Bureau Van Dijk*, 179 spin-off operations were selected. All of them were implemented between 2000 and 2013 by quoted parent companies and the dates of the announcement are definitely known. Amongst these operations, 90 were published on the *Wall Street Journal*: the news (approximately 105 pieces, an overall number of 94,383 words) was obtained from the database *Factiva* and through the text analysis methodology it was possible to define the positive or negative value of the content and the expressive tone used. The results of the analysis carried out as an event study (with observation of abnormal returns on event windows of diverse scale) show how the announcement of a spin-off operation, when considering the whole sample, generally generates value creation for the investors of the companies involved.

This confirms the evidence presented by the existing literature, according to which the announcement of a spin-off operation is received in a positive manner by the market, producing positive returns on average, especially around the announcement date, to then return to normal values in the days following the announcement. The announcement itself has the ability to release the economic value hidden within the parent company. Such a result proves even more evident if related to the market reaction in relation to spin-off operations reported on the *Wall Street Journal*: the investors seem to appraise stocks coming from companies implementing spin-off operations which were discussed by the press, thus amplifying the effect of the announcement on returns, quite notably in the day following the announcement itself. As far as the publication on the *Wall Street Journal* is concerned and according to the literature examined, it is deemed necessary to identify the moment in which publication occurs. Similarly to what happens when taking into consideration whether news was published or not on the *Wall Street Journal*, the effect generated by the announcement of spin-off operations on the returns of the companies involved appears to be amplified if news was disclosed by the press on a date prior to the announcement.

This effect seems even more evident for those spin-off operations published on the *Wall Street Journal* within a week of their announcement, confirming the first research hypothesis, according to whom the top and leading newspapers can influence stock trends, even without providing any new information. The publication of spin-off news, even if not “first-hand” news as it follows the announcement, contributes *de facto* to value creations for the shareholders. Finally, by comparing the average abnormal cumulative return registered on the date of the announcement with the ones of the date of the rumour publication on the *Wall Street Journal*, it is observed that in the symmetrical windows, it is

the rumour publication which generates a supplementary-return, while in the following windows, the announcement creates value for the shareholders.

The investors seem to place more confidence in the announcement rather than in the publication of the rumour, as being an official statement, it “reassures them” of the fulfilment of the operation. In relation to the event date taken into consideration, news on the spin-off operation produces an impact on the investors’ behaviour, both in the moment when the rumour is published on the *Wall Street Journal* and when the announcement of the operation itself is released (although the reaction is more evident at the moment of the rumour’s publication, during which average higher CAR is achieved compared to when the operation is announced). The market however, does not completely extinguish the effect generated by the publication of the news on the *Wall Street Journal* on a date preceding the announcement of the spin-off operation: indeed, at the time of the announcement and although less significant, an abnormal cumulative return is distinguished.

Some investors therefore seem to remain indifferent to the publication of news on the *Wall Street Journal*, placing more confidence in the announcement of the spin-off operation.

The media variable, when it comes to spin-off operations, acquires relevance as it influences the investors’ behaviour. If the news of the spin-off operation is spread “by the means of the press”, irrespective of the time when it ensues, the spin-off operation will cause value creation for the shareholders, proving to be even more effective in liberating the economic value hidden within the parent company. Hence, the contribution of this study to the existing literature is believed to be twofold: to begin with, it contributes in enriching spin-off literature by taking into account the media variable; it also attempts to increase the number of studies on the impact of media on investors’ behaviour.

Future developments of this study will on one hand focus on including in the analysis the trading volumes in order to study if the media variables affect also on this market variable. On the other hand, the focus will also be on integrating an analysis of variables that will allow in examining whether and in what way the investors’ characteristics influence the use and the elaboration of the information employed.

ABSTRACT

The high level of out of pocket payments (OOPs) constitutes a major concern for Greece and several other European countries as a result of the significant down turning of their public health finances due to the euro-debt financial crisis. Basic objective of this study is to provide empirical evidence on the effect of combining social health insurance (SHI) and private health insurance (PHI) on OOPs. Further this study examines progressivity (regressivity) between the funding sources of health care financing and the financial catastrophic impact of OOPs on insured's welfare. Conducting a cross sectional survey in Greece with widely accepted methods, we find that the combination of SHI-PHI has a strong negative impact of policyholders' OOPs for inpatient health care in private hospitals. Furthermore, we show that SHI coverage is not sufficient by itself to manage with this issue, while the health funding contribution by the poor people is greater than its share of financial wellbeing. Drawing evidence of Greece, a country with huge fiscal problems that has suffered the consequences of the economic crisis more than any other, could be for policymakers the starting point to consider the perspective of SHI-PHI co-operation against OOPs more seriously.

Keywords: *OOPs, SHI, PHI, regressivity, financial catastrophe, informal payments, Greece.*

1. INTRODUCTION

The economic adjustment programs and the tough monitoring policies for several European countries, as a result of the current euro-zone debt crisis, create reasonable doubt as to whether health systems are capable to offer financial protection to their citizens (Karanikolos et al., 2013).

Despite the fact that a main objective of health systems is to encourage risk pooling mechanisms against high OOPs (Dukhan et al., 2010) the implementation of public budget restraints due to the bailout agreements on health for countries such as Greece, Portugal, Ireland cause negative effects on

health care utilization and financing (Goranitis et al., 2014; Fahy, 2012). Also, in countries with pre-existing fiscal problems like Spain and Italy the austere policies on public budgets result damaging consequences on health care systems (Bosch et al., 2014; De Belvis et al., 2012). Regarding Greece, several studies provided evidence that health trends and finances deteriorated as a result of the recent financial crisis (Kondilis et al., 2013; VANDOROS et al., 2013).

Nevertheless, both before and after the significant cost-cutting strategies on health budgets, Greece, traditionally exhibits one of the highest OOPs ratios amongst developed economies (Niakas, 2013). Particularly for the year 2013, Greece recorded OOPs of around 30.7% as a share of current health expenditure (CHE) noting an increase of 6.36% compared with 2012 (OECD, 2015). Noteworthy also is the fact of the informal OOPs for health care especially to public providers which approximates the 20% of the total private health spending (Kyriopoulos et al., 2014; Lyberaki & Tinios, 2014). Apart from OOPs the rest financing types of Greek health sector are the state budget (taxation), SHI and PHI contributions (Siskou et al. 2008). The Greek public health funding in 2013 as a share of CHE was one of the lowest of the E.U. (28) countries, 65.53% (OECD, 2015). The financing of health system through PHI diachronically represents a minor share (2.9% in 2012 and 2013) to CHE and covers the 12.5% of the population at a duplicate basis (OECD, 2014, 2015; Biro, 2009). For Greece, the private hospital expenditure in 2012 ranged to 2.067 billion Euros, while the main financial contributor with the outstanding allocation 45.48% was the OOPs of insured (OECD, 2014).

Since health risk constitutes an unpredictable factor the aforementioned statistics drive this study to test the following research hypotheses:

1. The SHI funding, the mandatory SHI with complementary PHI coverage, individuals' income, age, gender, educational level, type of received inpatient care determine the extent of OOPs.
2. SHI's mandatory coverage and SHI with additional PHI protect individuals from catastrophic health expenditures.
3. The Greek health care system financing for private inpatient services is not equitable.

Thus, the basic objective behind this study is to investigate the effect of combining SHI and duplicate - complementary PHI coverage on OOPs. Further, another basic aim is to assess the catastrophic impact of OOPs on Greek individuals for hospital-based care in private hospitals contracted with the unique Greek SHI carrier. Moreover, with a respect to explore equity in health care expenses, our aim is to empirically analyze progressivity (regressivity) of the overall health financing system for inpatient care in private hospitals in Greece.

Specifically, our paper addresses the following research questions:

- (i) Which is the association of the financing sources of SHI, PHI and other crucial factors on OOPs for inpatient health care?

- (ii) Can SHI with complementary PHI coverage face the considerable or even catastrophic OOPs?
- (iii) Is the share of health payments contributed by the poor socioeconomic strata less or greater than its living standards;

While a substantial number of published studies has examined catastrophic OOPs for health care, the majority of them focuses on developing countries (Scheil-Adlung and Bonan, 2013). Indeed, almost of all the literature has dealt with this phenomenon in developing and low income countries, with rudimentary public health coverage (e.g. Kwesiga et al., 2015; Onwujekwe et al., 2014; Van Minh et al., 2013; Selvaraj & Karan, 2012). Little evidence exists about high or catastrophic OOPs in developed economies and no one of the published studies uses data concerning the major health public retrenchments due to the post financial crisis emergence era (Kronenberg and Barros, 2013; Scheil-Adlung and Bonan, 2013; Dukhan et al. 2010; Murray et al., 2003; Xu et al., 2003)

Furthermore, although a limited body of literature has dedicated substantial effort to empirically analyzing the effect of PHI on OOPs for several developed European countries, it only focused on the over 50's group of individuals and based on data prior to the financial crisis and its recession severity to economies like Greek (Paccagnella et al., 2013; Schultz and Tadesse, 2006; Holly et al., 2005). The empirical literature has no provided evidence of additional PHI to SHI against OOPs for a wide range of ages in developed countries, which were plagued by the economic crisis and have been suffered from health spending cuts. Also, after the outbreak of the 2008 financial crisis, no previous study has extensively examined the progressivity of health care financing in Greece for inpatient services in private hospitals.

We focus on private hospitals' inpatient events because this kind of services, as compared with outpatient, results in high OOPs or even in catastrophic individuals' expenditures (Dutta and Husain, 2012). Shin (2012) found evidence using grouped-data cases that PHI in South Korea has a limited negative degree on OOP health payments. Despite the significant contribution knowledge of Shin (2012) to examine the association of PHI with the other three major financial sources of Korean health system (state, SHI and OOPs financing), he states that there is a need for future research for analyzing PHI coverage effects on OOPs at a individual level. Further, Thomson et al. (2014) noted that is necessary to gather better data in order to fully understand the effects of the economic crisis on financial protection and equitable financing of health care systems. We manage to gather data including the major financing resources of inpatient events; information on such hospital payment practices is not systematically available and extremely difficult to be collected (Paris et al., 2010).

The present study aims at contributing to fill the important gap in the literature by examining the catastrophic impact of OOPs for a developed country after the outbreak of the financial crisis and providing an empirical analysis of the effects of combining SHI and PHI on individuals' OOPs not only for people aged 50 and over. The high degree of reliance on OOPs, in Greece and other heavily affected by the crisis countries, can turn out to be the starting point for policymakers to revise the currently ineffective of providing financial protection health systems. On evidence drawn from the financially hard-pressed Greek health care system, our study considers lessons of promoting and developing a system based on the pillars of co-operation between SHI and PHI.

2. THE NEW SOCIAL HEALTH CARE FINANCING AGENT IN GREECE.

The most crucial reform that the Greek state had ever done on the health sector, since the introduction of the National Health System in 1983, was the merger of the majority of SHI funds into a unique insurance carrier under the name National Organization for the Provision of Health Services (EOPYY) (Pappa et al., 2013). This SHI structural development is not innovative since similar patterns are detected inside and outside Europe (Karakolias & Polyzos, 2014; Kwon, 2009). Before the establishment of EOPYY in the beginning of 2012, a fragmentation of SHI funds (more than thirty) was operating on Greek health system resulting horizontal inequity for individuals. Thus, different occupational groups of insured with the same labor remunerations were paying different SHI contributions as well they were enjoying different benefits, health care access and utilization (Van Gool & Pearson, 2014).

By accepting influences from Western Europe the Greek health system continues to operate under a backdrop of mixed financing systems (Wagstaff, 2009). The operation of the former SHI funds under the umbrella of EOPYY, which largely relies on mandatory employees' and employers' contributions, basically simulates the German "Bismarckian" model (Economou & Giorno, 2009). The Greek health care system can be attributed as a SHI financing system such as the French, German, Korean and Japanese, mainly based on social contributions despite supplementary funding assistance from the tax-financed state revenues on SHI funds and NHS (Paris et al., 2010).

The new SHI fund operates as a monopsonist insurance player in the market. It purchases outpatient and inpatient health care services for its members from public and private health care providers under contract and covers the 95% of the insured and the 79% of the total population (OECD, 2014; Groenewegen and Jurgutis, 2013).

Despite EOPYY's public health insurance profile, it moves to strategic purchasing of health services from private providers, including contractual mechanisms and payment systems, in order to ensure efficiency and affect equity of access in health system performance due to the overcrowded Greek

public health care facilities (Thomson et al., 2014; Sissouras, 2014). Based on Keegan et al. (2013), the consequences of the economic crisis, as the rise of unemployment and households' income decline, led to an increase in demand for public health care services with limited financial resources to satisfy it. Kaitelidou and Kouli (2012) referred that the increase in demand for public health services in Greece can have a negative impact on the capability of the health system to maintain standards of care. Thus, financial crisis' consequences and chronic problems of Greek public hospitals (e.g. long waiting times for operations, low amenities standards, considerable volume of informal OOP) can drive population to the private hospital sector, despite the high formal cost sharing and extra billing payments in times of income strain, in order to meet the aim of inpatient treatment (Keegan et al., 2013; Kentikelenis et al., 2011). Hence, EOPYY recognizing the existing problems in public health sector, suggests that the private affiliated hospitals with the Organization perform important task, provide quality health services which some of them are not performed by the public sector or the latter is not sufficient enough to cover them (EOPYY's Press Release 09.22.2014).

In addition to its basic objective to provide equal, efficient and cost effective health care options, eliminating, thus, past inequalities, an important role it also plays is controlling and even reducing the public health care expenditure (Kaitelidou & Kouli, 2012).

The rigorous financing agenda which Greek health policymakers implemented during the last four years following the fiscal hints of Troika (E.U., E.C.B and I.M.F) allows for doubts to arise on whether EOPYY has succeeded in its aforementioned tasks (Economou et al., 2014; Sissouras, 2014).

3. AN OVERVIEW OF PRIVATE HEALTH INSURANCE.

A close look at PHI in OECD countries, revealed four distinct functions of the institution according to the type and extent of its coverage. First, substituting or acting as alternative of SHI where PHI offers an all-inclusive health care coverage (Preker et al, 2010). Second, supplementing SHI by providing, in part or in full, benefits that social insurance is not (Kumar et al., 2014). Third, offering coverage for health services already included under SHI, with the purpose to ensuring better access to private health care providers and new technology treatments (Kiil, 2012). Last but not least, offering complementary benefits that are provided to insured, against additional premium payment, along with SHI ones. Complementary PHI provides full or partial financing for health care for not fully reimbursed costs by the SHI (Basset and Kane, 2007). Despite, the strong or weak presence and even the different functions of private health insurers in OECD countries, PHI is an important primary or alternative source of health care financing (Pearson and Martin, 2005; Docteur and Oxley, 2003).

The high proportion of OOPs to THE and the generous benefit basket of publicly-financed coverage over the years, significantly obstructed the development of the PHI institution in Greece (Thomson

and Mossialos, 2009; Davaki and Mossialos, 2005). The PHI funding to THE in Greece, also ranges in low levels due to: (a) lack of confidence of population to the private insurance market (e.g. cream skimming), (b) lack of insurance awareness, (c) the belief of individuals that are fully covered from the SHI, (d) the limited income of individuals, (e) absence of suitable products to fill the gaps of social insurance and (f) several other social and cultural factors (Economou, 2010; Siskou et al, 2009). Mossialos and Thomson (2004) mention that the informal direct spending to health providers is a cultural custom which acts as a brake against the development of PHI in countries like Greece. They continue, that Greek people prefer to directly pay a doctor in order to ensure faster access and better quality to public health facilities rather than a third party as a PHI company.

3. STUDY METHODS

3.1 Sample Design and Research Instrument.

According to our study's objectives we carry out a cross-sectional survey. With a view to present a more comprehensive understanding of OOP, SHI and PHI funding for inpatient health care in private hospitals, we implement a non-probabilistic sample strategy in order to target a specific population which is quite difficult to be located otherwise (Bryman and Bell, 2003). Thus, our objective was to gain accessibility, isolate and examine a well-developed sample of Greek insured individuals who had experienced inpatient health treatment in private hospitals in Greece. The targeting of a specific group applies better with the convenience sample method (Wang et al. 2004). Further, due to the lack of a sampling frame (i.e. completed list of the target population), the use of convenience sampling (non – probability) with specific criteria for the selection of the respondents was considered suitable, while is the usual approach in similar studies (Gupta and Trivedi, 2014; Laokri et al., 2014; Kankeu et al., 2013; Dekker & Wilms, 2010; Saksena et al., 2010; Burak and Vian, 2007; Vian et al., 2006; Belli et al., 2004). Inclusion criteria for the sample are that individuals should be insured aged 18 years or older who had received inpatient health treatment. Furthermore, the adoption of the exclusion criterion of freelancers and entrepreneurs to participate in our survey as health care consumers due to the false declaration of their income intending tax evasion was abrogated meant by the implementing of convenience sampling (Matsaganis et al., 2012)

The collection of quantitative data (such as SHI funding, PHI funding, OOPs, income etc.) expressed as a monetary value based on a structured questionnaire. The structured questionnaire based on questions regarding health care financing (Balasubramanian et al., 2015; Nguyen et al., 2015; Van Minh et al., 2014; Tediosi et al., 2008). In order to minimize non response and maximize the quality of the data collected, the questionnaire was completed through a personal interview with each respondent (Stepurko et al., 2010). The combination of convenience sampling and personal

interviewing enabled us to gather sensitive data, such as: informal (thus illegal) payments to surgeons and anesthetists, in a relatively high response rate (Stepurko et al., 2010). Whenever applicable, participants were also asked to present their related financial documents (receipts, pay-roll sheets) (Yin, 1994).

Lavado et al. (2013) support the view that household expenditure surveys are not suitable to measure OOP and a good practice for this could be the rigorously tracking of OOPs outflows at selected validation sites (hospitals, clinics etc). Respondents in this survey were selected and interviewed outside of several private hospitals and the regional departments of social insurance fund with the precondition to have received inpatient care after a health shock in affiliated private hospitals with E.O.P.Y.Y. With a view to eliminate any recall period biases of the examined health expenditures the particular selection of the aforementioned locations for conducting the survey enabled us to ask the participants as directly as we could, avoiding in such a way any human memory losses (Lu et al., 2009).

In order to achieve a suitable sample of hospitalized patients and control for any uncertainty and bias of convenience sampling, we collected information on both genders, a wide range of age, various salaried employees and pensioners, various socioeconomic statuses and education levels in the main urban centers (Athens, Thessaloniki, Crete) of the country (Skowronck and Duerr, 2009). Further, we employed the equations of Cochran (1963) which is cited to Israel (1992) and Kraska-Miller (2013) respectively, as expressed below to yield the minimum number of hospitalization events required, aiming to provide evidence that our sample is representative of the population we are focused on our study.

$$1. SS = \frac{Z^2 * (p) * (1-p)}{c^2} \quad (i) \qquad 2. SS = \frac{X_{(1)}^2 * (N) * (pq)}{d^2 (N-1) + X^2 + p(1-p)} \quad (ii)$$

Regarding, the estimated prevalence of SHI and PHI population parameters in 2013 for policyholders, who received hospitalization health services in affiliated with EOPYY private hospitals, and using the above formulas, 102 needed for SHI insured and 14 for policyholders with the mandatory SHI and a parallel PHI.

Finally, the survey was conducted from June 2013 until December 2013 where 426 insured hospitalized once during this time interval willingly agreed to participate of a total of 551 respondents which were contacted. The majority of them (364) were covered for health care only by SHI, and 64 of them combined SHI and PHI.

3.2 Determination of the study variable “out of pocket payments” (OOPs).

According to Mossialos and Thomson (2002) all health care expenses that are paid directly by the health consumers can be labeled as OOPs while their main categorization is: on a) direct payments, b) formal cost sharing and c) informal payments.

- Direct payments: Direct payments represent health care expenditures, not covered by any insurance carrier, social or private.
- Formal cost sharing: The financial participation of insured on health expenses is a useful tool for SHI and PHI to reduce demand for unnecessary utilization of health services and control health expenditure (Drechsler and Jutting, 2005). Especially for PHI formal cost sharing is an important instrument of addressing with moral hazard and uncovering health risk of applicants (Schmid et al., 2010). The three main categories of formal cost sharing are co-insurance, co-payment and deductibles (Rombaldoni, 2012). Regarding SHI in our study, EOPYY imposes to its insured members a statutory co-insurance rate 30% or 50% on Greek Diagnosis Related Groups (DRG's) total costs depending on their former social security integration (3054/18-11-2012 Gazette of the Government). Concerning the PHI contracts of our participants the formal cost sharing is represented both by co-insurance rates and deductibles which respectively constitute percentage and fixed amounts paid by the insured before any official financing of the PHI coverage. According to Thomson and Mossialos (2009) the PHI for profit companies in Greece, except of the upper ceiling benefits reimbursement, use the co-insurance rates for inpatient care outside their official hospital network and the deductibles for encouraging their clients to activate primarily their social security.
- Informal or "under the table" payments: A definition that can be attributed to this illegal kind of health spending is the voluntary or sometimes extortionate compensation (in cash or in a form of gift) from patients to public doctors for ensuring better medical care and faster access to health services (Chereches et al., 2013). Although, reports for this phenomenon are mainly observed in former-socialist and developing countries, it is also relevant in developed economies with under-funding health systems like Greece and Turkey (Kaitelidou et al., 2012; Dimova et al., 2011; Tatar and Kanavos, 2006). Regarding the scope of our study which focuses on inpatient health care in affiliated with EOPYY private hospitals the informal payments represent the tax free financial payments from health users to health providers (no issue of legal receipts by surgeons and anesthetists) (Stepurko, 2010).

Based on the above, we define OOPs to be the aggregate amount of these hospital care expenses which were non-refunded to insured by the SHI or PHI coverage (see session 3.4). Specifically, we move on a demarcation of OOPs for inpatient health treatment into four main categories as given in Table 1.

Table 1 The categorization of OOPs for inpatient health care to private hospitals.

	Abbrev.	Categorization	
Aggregate OOPs	OOPs		SCI+FPC+FPP+IPP
1.Statutory SHI & PHI co-insurance	SCI	Formal Cost Sharing	SHI-30% or 50% respectively of Greek DRG's pricing practice PHI- deductibles depending on the contract
2.Formal payments to Clinics	FPC	Direct Payments and Formal Cost Sharing	OOP-extra charges with the issue of legal invoices PHI co-insurance rates depending on the contract
3.Formal payments to Physicians	FPP	Direct Payments and Formal Cost Sharing	Spending with the provision of legal tax services receipt to insured. PHI co-insurance rates depending on the contract
4.Informal payments to Physicians	IPP	Informal Payments	Spending without the issue of legal tax document. No reimbursement from SHI or PHI

3.3 SHI contributions and PHI premiums.

Despite the “equal access for all in a single health service system” EOPYY’s main objective the SHI contribution basis varies even today depending on insured’s former social security fund (Wingfield, 2012). For salaried employees who were included in our study the SHI payroll levies and employer-based contributions were determined depending on their occupational profile and their SHI fund position. With the launch of EOPYY in 2012, the SHI contribution rate for health care became the same for all pensioners whose healthcare provider is EOPYY and was determined at the rate of 4% of gross pensionable earnings (Law 3918/2011 published in the 31’A/02-03-2011 Gazette of the Government). Regarding PHI inpatient health care coverage, Greek population has the option to pay a risk-rated premium for individual contracts or a collective pre-payment health financing arrangement especially for big firms aiming to a complementary extra risk pooling mechanism, despite the compulsory SHI practice (Economou, 2010). The individuals in our study held either individual or collective duplicate complementary PHI contracts by profit-making insurance companies paying with non-income-related premiums in order to supplement the social security (e.g. faster access, new technology services) or to complement their reimbursements by bridging the gap between SHI hospitalization indemnities and the market prices (Paccagnella et al., 2013; Dukhan et al., 2010).

3.4 Statistical Analysis - Variable Construction of inpatient health funding.

The funding sources of our hospitalization events are SHI, PHI and OOPs. Following, Zhang and Liu (2013) we used a properly customized to our micro level data computation approach in order to illustrate an equation form comprising the overall health care funding as follows:

$$THE = SHI + PHI + OOPs$$

The monetary value of OOPs was estimated by deducting the monetary value of SHI and PHI reimbursement (post insurance funding mechanisms) from the aggregate hospital expenditures for each inpatient episode.

$$OOPs = THE - (SHI + PHI)$$

where $OOPs = SCI + FPC + FPP + IPP$ as presented in Table 1.

We adopted a multivariate regression-based approach aiming to present the influence of potential relevant factors on OOPs for inpatient health care. With a view to examine the relationship between total OOPs and exploratory variables we considered that the estimation of an ordinary least squares (OLS) regression model with a logarithmic transformation of our dependent variable (total monetary OOPs – continuous) would be the most appropriate approach (e.g. Malik and Azam, 2012; Salti et al., 2010).

Inspired by the model of Paccagnella et al. (2013) for each hospitalized insured i the potential association between OOPs and SHI, PHI and a vector of characteristics (Y) that are hypothesized to affect individuals' OOPs, was expressed as follows:

$$OOPs_i = f(SHI_i, Y_i, PHI_i, u) \quad i = 1, \dots, n$$

Following also, previous literature the independent variables include both quantitative parameters such the SHI funding, annual gross income (AGI) and age of hospitalized insured and qualitative which were expressed as dummies like gender (1=male, 0=female), educational level (1=tertiary, 0=no), surgery in hospitalization events (1=yes, 0=no) and possessing of a complementary PHI scheme parallel to the mandatory SHI (1=yes, 0=no) (e.g. Yamada et al., 2014; Almeida and Sarti, 2013; Ewelukwa et al., 2013). It should be mentioned that the last dummy, in contrast with Paccagnella et al. (2013), was treated as an exogenous variable and not as a binary endogenous. We did not move on specific formulations of endogenizing the dummy variable of PHI since the aim of this study was to examine the effect of the latter on OOPs and not the crucial determinants of holding PHI. Further, the sampling technique and the minimal recall option to gather categorized financing data from individuals who had experienced a health shock and therefore had incurred private expenses from

obtained inpatient treatment limited the phenomenon to have observations on our dependent variable (OOP_{si}) truncated to zero value (Cederberg and Mahal, 2010).

To control for non-normality, except the OOPs, SHI funding, annual gross income and age of insured were also transformed to log scale. Therefore, our transformed multivariate regression model is:

$$\ln(OOP_i) = b_0 + b_1 \times \ln(SHI_{1i}) + b_2 \times \ln(AGI_{2i}) + b_3 \times \ln(A_{3i}) + b_4 \times G_{4i} + b_5 \times THC_{5i} + b_6 \times E_{6i} + b_7 \times PHI_{7i} + u_t$$

$$OOP_i = SCI_i + FPC_i + FPP_i + IPP_i$$

All explanatory variables were entered in the model and statistical significance was assessed at $p < 0.05$. Statistical analysis was conducted using the econometric software package EViews.

3.5 Measurement of the financial impact of OOPs.

The three main measures of living standards are income, expenditure and consumption (O'Donnell et al., 2008; Wagstaff et al., 1999). O'Donnell et al. (2008), Wagstaff et al. (2003) and Younger (1996) support the view that consumption expenditure is a better indicator than income in developing and low income countries than the utilization of income. This is due to the presence of a large informal and unorganized labor sector in these countries. Nevertheless, several studies for developing countries use income as a measure of socio-economic status (SES), an indication that the choice depends on data availability (e.g. Almeida & Sarti, 2013). Depending, on O'Donnell et al. (2008) and Wagstaff et al. (1999) which reported that income is an appropriate measure of SES for developed economies and following similar studies (e.g. Kwesiga et al., 2015; Wingfield et al., 2014) we carried on our study based on annual gross income (AGI) of insured. According to the availability of our gathering data, the AGI per insured comprised salaries for labor services and pensions earnings during the last 12 months and is gross of taxation, SHI contributions and PHI premiums (Wagstaff et al., 2003).

3.5.1 Catastrophic OOP health care payments.

Catastrophic OOPs for health care can be attributed as these payments which require a remarkable proportion, in excess of a given pre-defined critical limit, of households' resources (O'Donnell et al., 2008; Van Doorslaer et al., 2006; Xu et al., 2003; Pradhan and Prescott, 2002; Feder et al., 1987; Berki, 1986). According to Wagstaff and Van Doorslaer (2003) the inviolable treaty and ethical conception of fairness in health care expenses necessitates that no one household ought to spend more than a given proportion of its income on health treatment (so called z). If it spends for health care in excess of this cut-off point (z) these payments can be labeled as catastrophic.

For the purposes of this study we classified health expenditures ($OOP=T$) as catastrophic if they exceed 10% of the insured's AGI (see also Selvaraj and Karan, 2012; Prinja et al., 2012; Castillo-

Riquelme et al., 2008). With a view to investigating whether the percentage of our sample exceeding this pre-defined threshold of 10% (z) we calculated an indicator (E) which takes values 1 or 0 if $(\frac{T_i}{x_i}) > z$ or $(\frac{T_i}{x_i}) < z$ respectively (O'Donnell and al., 2008)

$$E = 1[(\frac{T_i}{x_i}) > z]$$

Aiming to compare the impact of inpatient OOPs on individuals' income we separated our examined insured population into two sub-groups (Saksena et al., 2011; Schneider & Hanson, 2006). The first sub-group comprises individuals having only the compulsory SHI. The second one includes individuals holding a combination of SHI and PHI coverage in order to quantify the impact of OOPs on their welfare regarding the difference of their insurance coverage. For the first sub-group we generated our fractional variable using the ratio of OOPs to AGI of insured (Adhikari et al., 2009). Thus, our critical threshold for the catastrophic impact of OOP payments is:

$$\text{Catastrophic Health Expenditures}=1 \text{ if } \frac{OOP}{AGI} > 0.10$$

and

$$\text{Non Catastrophic Health Expenditures}=0 \text{ if } \frac{OOP}{AGI} < 0.10$$

We considered crucial for the second sub-group of individuals to add to the continuous variable of OOPs the annual PHI premiums in order to identify the impact of health expenditures relatively to the first sub-group (Supakankunti, 2010; O'Donnell et al., 2008; Merlis, 2002). We did not include to OOPs factors such as employer and employee SHI contributions as a common feature between the two sub-groups.

$$\text{Catastrophic Health Expenditures}=1 \text{ if } \frac{OOP+PHI \text{ premiums}}{AGI} > 0.10$$

and

$$\text{Non Catastrophic Health Expenditures}=0 \text{ if } \frac{OOP+PHI \text{ premiums}}{AGI} < 0.10$$

3.5.2 Incidence and Intensity of catastrophic OOP health care payments.

For the purposes of our study we used the most common and widely accepted method for measuring incidence and intensity of catastrophic health expenses which is based on the construction of various critical thresholds ranging from 5% to 25% of OOPs as a share of individuals' living standards (see

O'Donnell and Van Doorslaer, 2005; Wagstaff and Van Doorslaer, 2003). Following the literature, we compute the Headcount (HC), Overshoot (O), concentration indices (CE and CO) as well as rank weighted (RW) HC and O indices (Flores et al., 2008; O'Donnell et al., 2008; Wagstaff, 2008; Limwattananon et al. 2007; Wagstaff & Van Doorslaer, 2003; Wagstaff et al., 2003; Wagstaff et al., 1991; Lerman & Yitzhaki, 1989; Wagstaff et al., 1989 for more details). Especially for the concentration indices (CE and CO) we apply the convenient regression approach proposed by Kakwani et al. (1997).

$$2\sigma_R^2 \left[\frac{y_i}{\mu} \right] = \alpha + \beta R_i + u_i \quad (\text{iii})$$

3.5.3 Measuring progressivity of health care payments financing.

The most popular method to estimate the equity and the redistributive impact of health care expenditures from several funding mechanisms is the Kakwani (1997) progressivity index. The theoretical conception is that in a progressive health care system the proportion of health expenses contributed by the worse-off individuals will be less than its proportion of their ability to pay (ATP) and conversely in a regressive health care system the health funding contribution by the worse-off will be greater than its share of ATP (O'Donnell et al. 2008; Daniels et al., 2000).

The Kakwani index (π_k) ranges from -2 to 1. In the case of a positive (π_k) the health system is progressive and the concentration curve lies outside Lorenz curve and vice versa if (π_k) takes a negative value. In the rare case of proportionality (π_k) equals zero, resulting a graphical representation attribute where Lorenz curve and concentration curves coincide (Wagstaff et al., 2011; Wagstaff and Van Doorslaer, 2000; Kakwani, 1977)

We made use of convenient regression formula aiming to calculate values for the Kakwani index for each health payment variable (Wagstaff et al., 2003).

$$2\sigma_R^2 \left[\frac{h_i}{\eta} - \frac{y_i}{\mu} \right] = \alpha + \beta R_i + u_i \quad (\text{iv})$$

In accordance with the availability of our data and, although health funding are also allocated through direct and indirect taxes, we did not include issues as such, but we focused on the three main core financing sources of inpatient health care in private hospitals for Greece (OECD, 2015).

Especially, we analytically calculated two overall Kakwani progressivity values for the provided inpatient health care taking into account the estimated funding allocation sources (SHI, PHI & OOPs' categorization) of our survey and the reported financing contribution basis from OECD for the nearest year 2012 (OECD, 2014). We based on the following formula (O'Donnell et al., 2008):

$$\pi_k^{overall} = \sum_i w_i \pi_{k,i} \quad (v)$$

4. RESULTS

Descriptive Results

Our survey comprises 229 men (53.76%) and 197 women (46.24%). The average age of hospitalized individuals was 50.39 years. The average AGI of participants was €15,228.34. The average OOP spending was €2,035.72, corresponding to 13.37% of average AGI of individuals. The THE of these inpatient cases was €1,592,616.75 while their financing allocation is presented in Table 2. Considerable attention should be given to the share of the informal total payments to physicians which is greater than 14% of overall inpatient OOPs and almost 8% of THE.

Table 2 The funding sources of hospitalization cases (N=426).

Funding Sources			€	%	
SHI			618.809,00	38,85	
PHI			106.590,60	6,69	
OOPs total			867.217,15	54,46	
Total Health Expenditure			1.592.616,75	100,00	
Allocation of OOP payments			€	% of total OOPs	% of THE
Private	Clinics	Total			
Payments (SCI)			160.825,14	18,54	10,10
Private	Clinics	Total			
Payments (FPC)			305.228,33	35,2	19,18
Formal Total Payments to Physicians (FPP)			275.598,68	31,78	17,30
Informal Total Payments to Physicians (IPP)			125.565,00	14,48	7,88
Total OOP payments			867.217,15	100,0	54,46

The segregation between the two subgroups illustrates interesting issues to be discussed to our study (Table 3). For the SHI-PHI subscribers' group the share of OOPs to THE nearly amounts the 12.50% compared with the remarkable 60.07% of the SHI insured. Additionally, no one of the PHI policyholders informally paid a physician due to the potential PHI indemnity by providing an official receipt of medical services in contrast with the first sub-group where both parties make synergies to evade financial losses from taxation. Also, results represent that decreasing age constitutes an important factor of PHI holding (Banks et al., 2009). Finally, our findings are in line with other studies regarding the positive associated effect of higher income and better educational attainment on PHI holding (Paccagnella et al., 2013; Mossialos and Thomson, 2004; Besley et al., 1999).

* The OOPs here also includes the annual premiums for holding a PHI contract.

Regression Results

Table 6 shows the multivariate regression results regarding the impact of exploratory variables on OOPs in order to provide answers for research question 1. The control factors that positively influence OOPs are SHI funding, surgery process during inpatient stay and gender (with $p < 5\%$). An increase of 1% in the logarithmic SHI hospitalization funding has a positive effect of 0,64% on OOPs. Surgery processing which results in extra payments to surgeons and anesthetists also has a positive influence

on OOPs. Gender also has an effect on OOPs, with males having higher OOPs. Diametrically opposed the regression results revealed that individuals' option to hold a PHI contract along with the compulsory SHI coverage succeed in reducing the size of the logarithmic OOPs. The effects of individuals' income, age and education level do not show a major impact on OOPs level and also are not statistically significant (with $p > 0.05$).

Catastrophic incidence and intensity results.

Aiming to answer research question 2, Table 4 provides information for the incidence and intensity of catastrophic payments between the two sub-groups. The Headcount and Overshoot indices present a descending trend with the increase of the pre-defined thresholds. The results reveal that the percentage of individuals suffering from catastrophic OOPs amounts the remarkable (HC) 69.64%. Summarizing, incidence and intensity results demonstrate that the worse-off SHI individuals spend more proportionally than the better off and are more likely to experience catastrophic inpatient OOPs in private hospitals.

Regarding, the 2nd sub-group, which comprises SHI with additional PHI policyholders, the scenery changes dramatically. A hospitalized individuals' percentage of 51.56 (HC), spent for OOPs and PHI premiums less than 5% of their AGI. A 46.88% of them made health payments which ranged between 5%-10% of their AGI. A minor 1.56% represents one insured that proceeded on health expenditures greater than the catastrophic living standards' benchmark of 10%. The negative values of concentration indices (CE and CO) and the un-weighted HC and O related with RWH-RWO demonstrate similar patterns with the first sub-group.

Assessment of Progressivity Results.

The overall inpatient health care funding in contracted, with EOPYY private hospitals was regressive with a Kakwani progressivity value = -0,13593 indicating that the health funding contribution by the worse off was greater than its share of ATP, answering thus research question 3. Similar patterns are identified taking into account the relative allocation of financing agent (mechanism) in total private expenditure for Greece by an external database for the nearest reported year, = -0,15923 (OECD, 2014). The main reason that led to the overall financing regressivity is the remarkable proportion of OOPs to THE, especially on account of their categorized relative weights to total funding. Moreover, the regressivity of OOPs can also be verified by observing the Figure 1. The concentration curves for the four types of OOPs intersect the 45° line of equality, lie inside and dominate Lorenz curve indicating in this way that insured's private health spending is strong regressive. The Kakwani index for PHI premiums was calculated at -0.25911, while PHI concentration curve's placement is completely inside

Lorenz curve; this confirms the regressivity of PHI expenditures. In contrast, the total SHI contributions of the merged former insurance societies to EOPYY are marginally progressive, where the Kakwani index exhibits a positive value (0,02995). The Kakwani value for SHI is statistically near to zero since the contribution rate is the same for every insured's earnings regarding the SHI society which belongs. In Figure 1 SHI (employee-employer) contributions' concentration curve slightly lies outside Lorenz curve; this confirms their progressivity.

DISCUSSION

Our econometric results show that SHI has had a positive impact on OOPs. The low benefit level of Greek SHI DRG's reimbursement policy, the implementation of high co-insurance rates for inpatient events and the high pricing policy of private hospitals because of their upgraded amenities and new technology treatments compared with them of NHS's public hospitals justifies this paradoxical situation. This phenomenon is also described by previous studies and is associated with the aforementioned reasons (Wagstaff and Lindelow, 2008; Ekman, 2007). Based on our findings, the case of surgery conducted during the hospitalization in private hospitals also assists in increasing OOP spending of both sub-groups (Siskou et al., 2008). The SHI with additional PHI subscribers may also be burdened with co-insurance rates for surgeons' and anesthetists' remunerations depending on the affiliation or not among private insurers and private hospitals. The male gender shows to predict OOPs positively probably because of its greater prevalence according to the medical literature (e.g. Henderson, 2011; Dueñas et al., 2011) on cardiovascular diseases and thus to costly operations (CABG, coronary angioplasty and stenting).

Previous studies give diversified findings regarding PHI importance on reducing OOPs (Shin, 2012; Ekman et al., 2008; Holly et al., 2005). A different econometric approach by Paccagnella et al. (2013) among the over fifties in Europe (SHARE) gave evidence that the voluntary PHI in Austria, Denmark, Italy and Spain affects positively the OOPs. The same authors identified that supplementary PHI has a significant effect in reducing the burden of OOPs for the Netherlands while in Belgium, France,

Germany, Greece, Sweden and Switzerland it does not have a statistically significant effect on OOPs. However, it is clearly demonstrated from our regression and incidence-intensity results that the existence of mandatory SHI and complementary PHI coverage constitutes an efficient pre-payment risk pooling mechanism against catastrophic OOPs.

Murray et al., (2003) exhibited that the share of Greek households facing catastrophic health expenditures between the years 1993-2000 reached a 3.29% whereas the percentage of households impoverished due to OOP spending was 0.56, classifying Greece amongst the worse positions with Spain and Portugal. Households' protection from catastrophic direct health costs imposes a ratio of OOPs to THE less than 15-20% (Mc Intyre et al., 2008). Our findings indicate that the Greek SHI coverage does not protect efficiently its members against catastrophic OOPs. The significant percentage (69.64%) of the mandatory SHI policyholders to exceed the catastrophic benchmark of OOPs to AGI, indicates that hospitalization in private hospitals in Greece is financially prohibitive.

Regarding the first sub-group of insured, our catastrophic incidence and intensity results demonstrate a higher tendency for the poor to exceed the catastrophic health spending threshold. The coverage of inpatient health spending in private hospitals by the poor is proportionately greater than the wealthier. Similarities as our results detected in India (Selvaraj and Karan, 2012), in China (Zhang et al., 2010), in Nepal (Saito et al., 2014), in Ghana (Amporfufu, 2013), in Iran (Rezapour et al., 2012), in Lower Myanmar (Lwin et al., 2011) and in Western Balkan countries (Bredenkamp et al., 2011). Nearly, the absolute majority of SHI with additionally PHI policyholders managed to keep the Headcount Index below the critical limit of 10% of their AGI which's excess classifies OOPs as catastrophic.

The substantial proportion of OOPs in the southern countries of E.U. (Greece, Italy, Portugal, Spain and Cyprus) is further deteriorated taking into account the fact that the distributional government policies of tax and social insurance systems becoming more regressive (Rombaldoni, 2012). Especially, for health systems such as the Greek with limited financial protection, in which OOPs are extremely significant and the hidden health economy thrives over time, the treaty of equity in health funding is rebutted resulting thus the worse off groups to pay the price of high health expenses (Economou, 2010). Our overall regressivity results confirm the literature. SHI appears progressive in countries with mandatory universal coverage, PHI is regressive due to the non-binding of premiums with insured's income and when health funding predominantly relies on OOPs the health system is characterized most regressive (Crivelli and Salari, 2014; Gottret and Schieber, 2006; De Graeve and Van Ourti, 2003; Thomson and Mossialos, 2004; Murray et al., 2000). Based on our results from Kakwani indices, the poorer socio-economic groups spend more than their ATP for inpatient health services in private hospitals than the better off population, making the system regressive and dispelling the principle of

vertical equity in health care funding (O'Donnell et al., 2008). Similar current findings for OOPs' regressivity presented in low income countries in Africa (Onwujekwe et al., 2014; Mtei et al., 2014; Munge and Briggs, 2013; Ataguba and Mc Intyre, 2012; Mills et al., 2012; El Gazzar et al., 2010), in Middle East (Abu-Zaineh et al., 2008) and in Latin America (Seinfeld and Besich, 2014). For European countries, OOPs' regressivity was ascertained in France (Debrand and Sorasith, 2010), in Estonia (Võrk et al., 2009) and in Hungary (Baji et al., 2012). The progressivity of OOPs in the low-middle income Asian countries (e.g. Bangladesh, Sri Lanka, Thailand) occurs because of the utilization and access of health services more from the rich population than the income confined poor strata, fact that constitutes equity in health financing more theoretical rather than a real situation (Joe and Mishra, 2009; Van Doorslaer et al., 2006, 2005). In Australia, the distribution of OOPs over time is regressive, while all health systems reforms since 1984 did not manage to affect efficiently the health care financing, except the Lifetime Cover Scheme in the beginning of 2000 which encouraged population to purchase and hold PHI coverage with positive progressive outcomes on health funding (Hajizadeh et al., 2014)

In addition, our findings confirm previous studies regarding informal OOPs in the Greek health sector (Nikolentzos and Mays, 2008; Papanikolaou and Ntani, 2008). Our descriptive results indicate that informal OOPs are a major driver of health care financing in Greece and occur not only in the publicly-financed NHS hospitals **but also in private health market** (Souliotis et al., 2015). **Regarding informal OOPs**, Greece, a country that counts its accession to E.U. since 1981 can only be compared **with the former Eastern Bloc countries** (Gordeev et al., 2014; Tambor et al., 2014), with Turkey (Brown et al., 2014) and generally with low and middle income countries (Kankeu et al., 2014; Lindkvist, 2013). The paradox is that while, in Greece the combat against tax evasion is a vital governmental objective in order to achieve debt sustainability and restore public finances, our findings suggest different conclusions (Apergis and Cooray, 2015; Exadaktylos and Zahariadis, 2014).

5.1 Policy Implications.

Policymakers have to implement radical measures in order to reduce the extremely high formal and informal OOPs, to ensure vertical equity in health care funding and to encourage the institution of PHI to complement the mandatory SHI.

No one can doubt the considerable role performed by private hospital sector as an alternative health provider (Duckett, 2005) to the underfinanced and overcrowded Greek public hospitals (Sissouras, 2014) despite its high pricing policy for inpatient services. However, the Greek state must allocate more financial sources to public hospitals. The improvement of public hospitals' provided services can

offer especially to the vulnerable and worse off groups of population better accessibility avoiding thus their extra-billing option to private hospitals (Kyriopoulos et al., 2014).

Also, policymakers should revise the pricing policy of Greek DRG's for inpatient cases in affiliated with EOPYY private hospitals. While the international experience suggests that a DRG includes any kind of medical and non-medical health care (Polyzos et al., 2013), the SHI reimbursement policy exempting surgeons' and anesthetists' cost components of DRG accounting, resulting thus the individuals to deal with these financial consequences in private hospitals (Niakas, 2013).

Policymakers should emend co-insurance rates with consideration to insured income level or either by substantially reducing or eliminating them for people with chronic health conditions (Lee and Shaw, 2014). Due to the Greek fiscal restraints, it is recommended the revision of Greek DRG's pricing and the readjustment of co – insurance shares to be replaced by higher SHI contributions and a more efficient tackling to tax evasion in health system.

Furthermore, although to other countries gate-keeping for secondary health care is compulsory and encouraged by financial incentives, in Greece is not a prerequisite norm incurring thus financial costs for SHI and insured from unnecessary use and a supplier-induced demand practice of health services (Economou et al., 2014; Paris et al., 2010).

Another important issue that policymakers should to settle directly is the significant delay of EOPYY's payments to private hospitals (Karakolias and Polyzos, 2014). In addition, the extra "haircuts" to private hospitals through re-bate, claw-back and retroactive upper ceiling mechanisms bring financial hardship to their budgets and thereby result higher OOPs to insured (167A/23-07-2013, 2243/18-08-2014 Gazettes of the Government).

Finally, the state should reinstate tax incentive policies for individually PHI policyholders. The economic downturn on Greeks' pay roll scale and the evidence of strong positive link between individuals' high income and purchasing of PHI impose to the state to revise the dissuasive legislation (4110/2013 and 4172/2013 Gazettes of the Government). On the other side PHI firms should promote more flexible and premium affordable coverage programs meeting the tough economic situation of the potential subscribers (Economou, 2010).

CONCLUSIONS.

Our results exhibit that EOPYY managed to ensure for all insured equal access and utilization to inpatient health care in private hospitals irrespective of socioeconomic criteria but failed to protect Greek population from catastrophic OOPs. On the other hand, our findings may help policymakers and insured to revise their views about PHI potentiality against financial catastrophe when a health

risk occurs. The cost-containment of public finances has made the health system financing more regressive because it depends on low SHI benefit packages and high sharing rates creating hence redistributive inequity. Additionally, direct formal and informal payments compound more the financing inequity problem. The deep recession of the Greek economy in the current period cannot reverse this situation with the given SHI contributions. The predominant trend of reliance on OOPs in Greek health system imposes higher levels of catastrophic health expenditures (Saksena et al., 2014) and panders an inequitable climate of health financing (De Graeve and Van Ourti, 2003). Nevertheless, the extremely high share of OOPs in Greece and other hard influenced by the crisis countries requires from policymakers to face PHI as an alternative source of health financing in order to reduce the financial ruin of households' OOP spending and improve funding fairness on their health care systems.

Endnotes

- (i) SS corresponds to the required sample size. We used as inputs the Z-value of 1.96, a 5% (C) margin of error and an estimate of the (p) prevalence of insured's hospitalization in private hospitals.
- (ii) SS is the sample size, $X^2_{(1)}$ is the chi-square value (3.84), N is the known number of hospitalization cases in private hospitals under EOPYY's coverage, p and q are the population proportions and d^2 is the desired degree of accuracy (0.0025).
- (iii) The regression coefficient β reflects the values for concentration indices. Continuing, y_i is whenever the examined health variable of interest, μ its mean, σ_R^2 is the variance of the fractional variable of N insured individuals in socioeconomic distribution ranking by their income. R_i reflects the insured's individual cumulative proportion in the annual gross income distribution where observations are classified in ascending order to sum up to 1, based on the formulation of Lerman and Yitzhaki (1989): $R_i = \frac{1}{n} \sum_{j=1}^{i-1} w_j + \frac{1}{2} w_i$. Although the simplicity of the most common computational method of convenient covariance $C = 2cov\left(\frac{y_i}{R_i}\right)\mu$ (Wagstaff et al., 2003) calculating concentration indices, we implied the convenience regression method in order to estimate the standard errors of CE or CO.
- (iv) Where hi is the health payment variable for insured individual i , yi is it's his/her ATP variable, η and μ are their averages respectively and σ_R^2 is the sample variance of the fractional rank. The Kakwani index is represented by the estimation of β from the OLS equation results as well as its standard error. Just as before to concentration indices we modeled the OLS equation with the option of the Heteroskedasticity Consistent Covariances (White) for the presence of any heteroskedasticity (i.e. we obtain more efficient estimates by correcting the standards errors).
- (v) Where w_i denotes the proportion's weights of each health funding allocation source of inpatient total health expenditures to private hospitals and $\pi_{k,i}$ indicates the Kakwani index for this source.

MEASURING THE IMAGE OF ETHICAL FOOD

Grimmer, Martin¹; Viassone, Milena²

¹Tasmanian School of Business and Economics, University of Tasmania, Hobart, Australia

²Department of Management, University of Turin, Turin, Italy

ABSTRACT

In the last decade, the topic of ethical food has assumed increasing importance in the international literature as consumers become more and more aware about what they eat. Despite several studies having been carried out on this topic, there is a lack of literature specifically on the image of ethical food and its characteristics. This paper aims at offering a descriptive and prescriptive model for measuring the image of ethical food which is able to reflect the contribution of different dimensions. This aim is pursued through a literature review of the main drivers affecting the image of ethical food, and the development of a measurement instrument that uses several possible dimensions. Results show that ethical food image may be affected by five dimensions: sustainability of ethical food, attributes, food uniqueness, psychological characteristics, and holistic characteristics. This paper provides a theoretical framework, which in the future could be applied to particular areas of research and allow the exploration of the potential of ethical food in related sectors such as tourism.

Keywords: *Measurement; Ethical Food; Ethical Food Image; Tourist Destination; Likert Scale; Sustainability.*

INTRODUCTION

In recent years the topic of ethical food has been increasingly at the center of international debate and indeed could be considered a real driver of tourism competitiveness (Viassone and Grimmer, 2015). Food is considered ethical when it conforms to the following features: (1) it is produced in a natural and biological way, without the use of chemical substances which may damage the health of consumers or damage the environment; (2) it's production is not exploitative of workers and does not contravene laws and agreements regarding human rights, and (3) it is produced as much as is possible only at a short distance from the point of sale (Lindeman and Väänänen, 2000).

Issues concerning animal rights and welfare, environmental degradation, consumption, human exploitation, hunger, and sustainability fall under the scope of food ethics (Monaghan, 2012). The ethical food sector is sizable and accounts from 5 to 10% of the total food and beverage trade globally

(Sarkar, 2014). It is generally argued that a more ethically-based food system should pursue improved well-being, protection of the environment and improved public health (FAO, 2001), and that ethical choices are important not only for society but also for individual consumers (Context Marketing, 2010). Consumers are becoming more and more aware of their consumption choices, and their impact; in particular, this awareness is shown in food consumption where ethical considerations apply to product, brand and channel choices (Sebastiani *et al.*, 2012; van Doorn and Verhoef, 2011; De Pelsmacker and Janssens, 2007).

For these reasons, the image of ethical food could play an increasing role in decisions to consume a range of products or services. There are several studies in the literature involving measurement of the image of a destination (Casalegno and Viassone, 2012; Echtner and Ritchie, 2003), or of a local cuisine (Peštek and Činjurević, 2014). However, none focus on the image of ethical food. While the topic of ethical food has attracted interest in recent years (Shaw *et al.*, 2015; van Doorn and Verhoef, 2011; Carbone *et al.*, 2009), there is a lack of work on the measurement of its image. This paper aims at proposing a descriptive and prescriptive model to measure the image of ethical food. To achieve this objective, this paper analyzes the literature about drivers affecting the image of destinations, food and ethical products, and creates a measurement framework to evaluate ethical food image. The results of this paper represent an important starting point to apply the model to specific areas/destinations, and could open, in the future, a useful debate on the effects of image on the choices of consumers.

THE CONCEPT OF ETHICAL FOOD

Food and ethics intersect in everyday practices as well as in abstract inquiry, and for this reason it is important to define clearly what 'food ethics' means. Food ethics could be considered as an interdisciplinary field that provides ethical analysis and guidance for human conduct in the production, distribution, preparation and consumption of food (Pollan, 2008). However, if ensuring that every individual has affordable access to sufficient and nutritious food is a moral imperative, the definition of ethical food is not so clear or shared in literature. Nonetheless, food is often the subject of ethical questions because the food we eat, and the way we eat, are an integral part of social behavior and cultural patterns, which themselves differ in many ways (Rudd and Mills, 2014). Environmental and animal rights issues also have a strong influence on attitudes towards organic and ethical food, and the same occurs because of political motives (Biel and Grankvist, 2010; Honkanen *et al.*, 2006).

'Ethics' is a broad, flexible and often highly personal term when consumers apply it to food purchased in supermarkets or specialty stores (Context Marketing, 2010). Ethical food is the expression of several attributes and perceived benefits regarding how a food is produced or processed, its impact on the

environment, adherence to quality and safety standards, and where food is sold and how it is priced. Generally, ethical food has been associated with environmentally responsible and sustainable production systems (Viassone and Grimmer, 2015). The main elements of the sustainability of ethical food concerns sustainable production, and within this concept local production and seasonality are favored. Similarly, waste reduction and reduced packaging could be considered as advantages of ethical food (van Doorn and Verhoef, 2011; Lindeman and Väänänen, 2000).

The debate on ethical food also investigates whether or not people have a moral obligation to act ethically in order to achieve sustainable development, or are individually overburdened by taking on a responsibility they cannot shoulder (Sinnott-Armstrong, 2005). In particular, the topic of ethics involving food encompasses, amongst other things, the following values:

- *the value of food*: food is considered essential for the survival of human beings;
- *the value of enhanced well-being*: the need to enhance the well-being of citizens as recognized by each nation. Charity is considered necessary to respond only to desperate and pressing situations but in order to provide for long-term improvements in well-being it is essential to have people with access to skills, capital, employment, education and opportunities; with regard to sustainable agriculture it should count on a viable rural infrastructure and an enabling policy environment;
- *the value of human health*: ethical and organic food is considered important for health reasons, with value placed on natural and less-processed food;
- *the value of natural resources*: very important here is the debate on the use of natural resources and on the necessity of sustaining certain resources for human survival and prosperity, and
- *the value of nature*: this encompasses environmental and animal welfare matters, as well as issues such as the preservation of natural areas, biodiversity and values such as beauty, complexity and integrity; these should play an important role in the decisions of governance for a territory.

Ethical questions related to the food sector are further linked to the challenge to meet the present needs for food supply, without impairing the future of humankind and nature (Raoult-Wack and Bricas, 2002). Thus, ethical food involves a set of ethical concerns raised about food: how it is produced, the meanings it carries, the implications and legacies it leaves. In this way, ethical food covers diverse values, each appealing to consumer behavior for different reasons and to different effect (Lang, 2010). For all these reasons, ethical food can be considered food produced in a natural way without the use of chemicals, without damage to the environment and exploitation of human labour, and without leading

to any human suffering. Ethical food is thus most likely to be produced and consumed locally, and in such a way so as to avoid polluting packaging.

THE IMAGE OF ETHICAL FOOD: MAIN DRIVERS

The image of ethical food has not been studied directly in literature, though there are some important contributions offered by several scholars concerning similar objects of analysis. In particular, the study of the image of ethical food requires a consideration of three aspects in that it is necessary to analyze studies concerning the image of tourist destinations (given that the image of a destination can strongly affect that of its products), of food, and of ethical products. With regard to food and related sectors, literature has largely investigated the perceived image of tourist destinations (Casalegno and Viassone, 2012; Page and Connel, 2009; Olimpia, 2008; Hankinson, 2004; Echtner and Ritchie, 2003) or, more specifically, the image of local cuisine (Peštek and Činjurević, 2014). The image of a destination can be defined as “the sum of beliefs, ideas and impressions that a person has of a destination” (Crompton, 1979, p. 18), and Baloglu and MacCleary (1999) point out that images about destinations are based on perceptual/cognitive and affective/evaluative dimensions (see also Kim and Perdue, 2011). In this context, gastronomy can play a significant role in creating a quality visiting experience for tourists, and help in building a destination image (Viassone and Grimmer, 2015). In particular, a tourist could have an image based on their perception of a destination’s food, cuisine or gastronomy, and this may be an important attribute that could be used in destination image building. Indeed, Trunfio *et al.* (2006) talk about ‘enogastronomic’ tourist attractions (immersing oneself in the culture of a destination, often with a culinary focus).

In considering the drivers affecting the image of tourist destinations, Casalegno and Viassone (2012) individuated five main dimensions: *functional characteristics*, that is, directly observable or measurable characteristics such as price (Echtner and Ritchie, 2003); *attributes*, how the tourist place or destination can be evaluated with common metrics; *psychological characteristics*, that is, characteristics in the mind of the tourist that can’t be directly measured (friendliness, atmosphere) (Echtner and Ritchie, 2003); *holistic factors*, corresponding to a set of different impressions created in the mind of people (Reilly, 1990), and *level of uniqueness*, in terms of distinctiveness of features, aura and atmosphere. If we focus our object of analysis only to food and cuisine, recent research suggests that local cuisine image comprises four components or dimensions: food uniqueness and cultural heritage; food quality and price; nutrition and health benefits of food, and the affective image of food (Peštek and Činjurević, 2014). An older study by Lindeman and Väänänen (2000) also looked at motivations for choosing ethical food, and canvassed three dimensions: ecological welfare (including animal welfare and environmental protection), political values, and religion. In this regard, while the image of food in terms of local

cuisine, and consumer motivations, has been looked at, ethical food remains an unexplored field with regard to the measurement of its image.

In the literature, it is suggested that most consumers make the automatic assumption that if a product is ethical it is also of a good quality. In particular, for several companies, ethical standards have become more important than the standards placed on quality, and this aspect has a meaningful effect on the marketing of companies everywhere. According to Sciarelli (2006), a very important factor for enterprises is the visibility of the firm, that is, the importance assumed by its image in the stakeholder's view. A higher visibility of the firm can lead to the use of ethics in order to improve the quality of strategy and marketing policies. In this regard, it has been found that consumers do respond positively to the ethical or environmental image of firms (Grimmer and Bingham, 2013). A very important role emphasized in the literature with regard to ethical food is its sustainability. This aspect concerns sustainable production, such as the creation of goods or services using economical, safe and non-polluting processes, being able to conserve energy and natural resources, and providing socially rewarding work for those involved in production and distribution. Generally, both local production and seasonality of ethical food are favored, in addition to waste reduction and reduced packaging (e.g., purchasing loose fruits and vegetables, avoiding small bottles, purchasing only what is necessary) (Viassone and Grimmer, 2015).

The contribution of this paper consists of merging the literatures on the image of destinations, of food and of ethical products, in order to propose a model for measuring ethical food image.

RESEARCH MODEL

Considering the increasing importance attributed to ethics in different fields such as tourism, finance, and so forth, its application to the food sector is a logical and obvious extension, particularly with regard to the concept of image. For this reason, the key issue of this paper is: how is it possible to measure the image of ethical food?

In order to provide an answer to this question, the methodology used in this paper consists of: (1) a systematic analysis of the drivers supported by literature with regard to the image of destinations, food, and ethical products, and (2) the creation of a prescriptive model able to canvass all the aspects affecting the image of ethical food and to provide a suitable measure.

Given the different drivers in the literature, the model proposed consists of five different drivers which may be relevant in order to gain a final measure of ethical food image. The measurement model could be structured in terms of a questionnaire based on the following characteristics:

- *sustainability of ethical food*: in terms of safety and non-polluting production; reduced waste generation and the reward for the people involved in production and distribution, and in terms of preference for local and seasonal food;
- *attributes*: including freshness of food, nutritional content and price;
- *psychological characteristics*: involving sensations generated with regard to taste, to memories, to price and to the feeling of wellbeing generated by responsible action;
- *food uniqueness*: in terms of characteristics such as the ability to distinguish itself from competitors, and cultural heritage in terms of convergence of the food with the culture of reference, and
- *holistic characteristics*: in terms of suitability of the communication of food and the results of this experience.

Proposed measurement items that will be answered on a five-point Likert scale (1= strongly disagree to 5= strongly agree), are shown in Table 1.

The questionnaire is proposed to be completed by consumers who have already tried ethical food, not necessarily in the point of sale, and are aware that the food was ethically sourced.

The model, based on these five dimensions, is suitable to be tested on a relevant sample, asking respondents to express agreement or otherwise to the 22 items for a specific food object. This questionnaire could also be viewed as a variation of the SERVPERF questionnaire (Cronin and Taylor, 1992). The reliability of the instrument and its dimensions should be measured through the level of the Cronbach's Alpha, and appropriate convergent and discriminant validity tests undertaken to ensure the construct validity, stability and robustness of the measurement model. The model is displayed graphically in Figure 1.

ETHICAL FOOD
Sustainability of ethical food
Production of this food is realized through safe and non-polluting processes
Production of these goods is socially rewarding for the people involved in production and distribution
Local production of this food is favored
Seasonality production of this food is favored
Production of this food involves waste reduction and reduced packaging

Attributes
This food is fresh
The nutritional content of this food is high
In general, my expectations about this food have been satisfied
Price is reasonable
Psychological characteristics
This food is good and genuine
This food evokes nostalgia for "dishes of the past"
I feel good in choosing this food because I know that I am making a responsible choice
This food is easy to find
Food uniqueness and cultural heritage
This food offers unique characteristics
The image of this kind of food is distinct from other kinds of food
This food reflects the moral beliefs and values of the culture it comes from
This food reflects the characteristics of the traditional cuisine
Holistic characteristics
Communication related to this food is suitable for the selected target
Proprieties of this food are well emphasized in shops and in restaurants
The medium used to communicate ethical food in restaurants and shops is the most appropriate
The experience of this food involves all the senses
In general, my expectations about this food have been satisfied

Table 7. *THE FRAMEWORK OF DRIVERS FOR THE MEASUREMENT OF THE IMAGE OF ETHICAL FOOD*

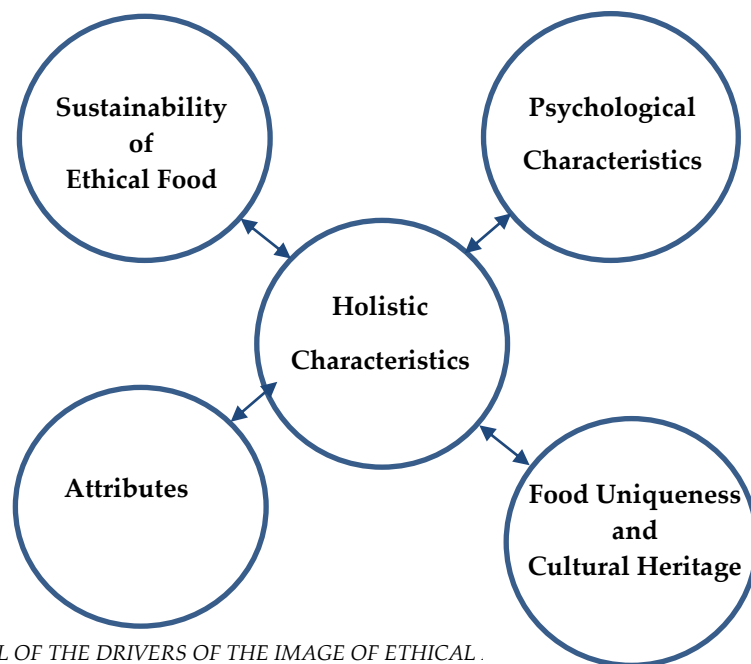

FIGURE 1. *MODEL OF THE DRIVERS OF THE IMAGE OF ETHICAL*

In order to evaluate the image of ethical food in a global way, it will first of all be necessary to evaluate the image perceived by each single consumer involved in the survey. This will result in the average Q_j of judgments provided by the same to the 22 sentences (Q_{ij}):

$$Q_j = \frac{\sum_{i=1}^{22} (Q_{ij})}{22}$$

Then, the average of the value of Q_j registered for all the consumers involved (corresponding to the global consumer perception of the image of ethical food) should be computed (Tardivo *et al.*, 2013):

$$Q = \frac{\sum_{j=1}^n Q_j}{n}$$

Generally, values higher than 3 should indicate a good image of ethical food (Viassone, 2011).

DISCUSSION OF RESULTS

The aim of this paper has been to develop a model and a measurement approach to assess the image of ethical food. This is an important endeavor due to the increasing value placed on ethics and ethical approaches in the literature (Shaw *et al.*, 2015; Monaghan, 2012; Carrington *et al.*, 2010), and more specifically due to the attention that ethical food and the ethical food sector now generates amongst consumers (Sarkar, 2014; van Doorn and Verhoef, 2011; Carbone *et al.*, 2009). Viassone and Grimmer (2015) also argue that ethical food can be an important driver of tourism attractiveness, and discuss the case of the Slow Food movement. Slow Food can be seen as part of the cultural tourism market, which attracts tourists who are interested in unique culinary experiences and the consumption of local food and beverages.

As was stated in the introduction, while the topic of ethical food has, therefore, attracted attention in recent years, there is limited if any research on the measurement of its image. As a result, a review of related literature on destinations, food and ethical products was undertaken. Tourism destination image provides the most logical framework, as food and gastronomy are often an important part of destination image building (Peštek and Činjurević, 2014). Tourists, in this regard, will have both cognitive and affective reactions to a destination that may also be food related (Kim and Purdue, 2011). For example, a tourist might know that Paris contains a high proportion of Michelin Star restaurants (cognitive); like Paris as a destination as a result of this, and be excited about visiting (affective). The five dimensions of tourist destination image (functional characteristics; attributes; psychological characteristics; holistic factors; level of uniqueness) evaluated by Casalegno and Viassone (2012)

provided a starting point, therefore, for the identification of factors that might also underlie the image of ethical food. Research on local cuisine image provided further ideas for the image of ethical food, with factors such as food uniqueness and cultural heritage; food quality and price; nutrition and health benefits of food, and the affective image of food, being identified (Peštek and Činžarević, 2014). Finally, the image of ethical products in general – for example, that such products are of high quality, sustainable, do not exploit workers, and reduce waste – suggested further factors for consideration (Viassone and Grimmer, 2015).

As a result of the literature review, five types/categories of drivers of ethical food image were proposed: sustainability of ethical food, attributes, psychological characteristics, food uniqueness and cultural heritage, and holistic characteristics. These drivers each consist of various individual issues, making up the 22 items on the planned questionnaire. As shown in Figure 1, four of the drivers – sustainability of ethical food, attributes, psychological characteristics, food uniqueness and cultural heritage – can be considered to be ‘primary’ in the sense that they each are directly measuring aspects of the ethical food product itself. The fifth driver – holistic characteristics – can be considered ‘secondary’ in the sense that it concerns communications and experiences that derive from the other four. In addition, it could be suggested that some of the drivers act in juxtaposition to one or more of the others. For example, attributes are more likely to be cognitive whereas psychological characteristics are more likely to be affective. In this regard, it might be expected that scores on these two dimensions will be negatively correlated (Kim and Purdue, 2011). Sustainability of ethical food and food uniqueness and cultural heritage may not be in juxtaposition to the same extent as attributes and psychological characteristics; however, the former is more aligned with cognitive image aspects and the latter with affective image aspects. Thus, scores for these drivers may also be negatively correlated. In this regard, it would also be expected that scores for sustainability of ethical food and attributes would be positively correlated, as well as scores for psychological characteristics and food uniqueness and cultural heritage.

THEORETICAL AND MANAGERIAL IMPLICATIONS

The main reason that researchers and marketers should be interested in concepts such as image is that these are mechanisms which are used, consciously or unconsciously, by consumers when they make consumption decisions. Kim and Perdue (2011) state that product image acts as a decision-making heuristic, that is, as an aid to managing and simplifying the complexity of consumer choice. As consumers often have limited knowledge about products, image acts as a proxy for the potentially large number of product attributes, thus reducing the amount of information that has to be processed. This is similar to how the concept of brand loyalty works: to simplify the decision-making burden for

the consumer by reducing the number of brands that are considered when choosing a product (Quester *et al.*, 2007). The ethical food image of a particular product would, therefore, allow a consumer to apprehend quickly the performance of the product on that characteristic. As Kim and Perdue (2011) point out, as the image of a product becomes more positive, the probability that a consumer will purchase it increases. In this regard, if it can be established that a food product has a strong ethical image, it is more likely that a consumer will purchase it. Thus, an ethical food image can add value to the brand equity of a food product (Olimpia, 2008; Quester *et al.*, 2007).

From a theoretical point of view, this paper has extended the concept of product or destination image to ethical food, and adapted frameworks from tourism, food and ethical products to a new application. A model of the drivers of ethical food image has been developed and its underlying structure discussed. This model now needs to be empirically tested in terms of its dimensionality and the validity of the measurement model. This testing will then have implications for the theoretical interrelationships between the proposed drivers and thus how an overall score for ethical food image can be developed. Image is also affected by factors internal to the consumer, such as experience, as well as the external factors made up of the five proposed drivers (Hu and Ritchie, 1993). Further development of the ethical food image measurement model could also benefit from a consideration of relevant internal consumer factors.

From a managerial point of view, evaluating the ethical food image of certain food products has important implications for product development, advertising and promotion. The five proposed drivers of ethical food image each suggest ways in which a product needs to be developed and communicated to consumers, and there also needs to be congruence between each category of driver. Indeed, a product image needs to be coherent and consistent (Olimpia, 2008). The ethical food image measure could also be applied to relevant gastronomic or culinary tourist destinations so as to examine the congruence between destination image and food image characteristics. Food organizations such as Slow Food, or so-called social food farms, could also use the measure to assess the ethical image of their activities and events (Viassone and Grimmer, 2015; Carbone *et al.*, 2009).

CONCLUSIONS

This paper has added to the ethical food debate by combining literatures on destination image, food and ethical products to create the proposed measurement model. The assessment of this model is the next step, using a relevant sample of respondents. Once the questionnaire instrument has been evaluated in terms of its item characteristics, reliability and construct validity, the measurement model will allow for the ethical image of a specific food object to be evaluated. This is a significant

development given the increasing importance placed on ethical products, as discussed earlier, and on ethical food in particular (Sarkar, 2014; van Doorn and Verhoef, 2011). Ethical food image has many potential applications, not only in terms of consumer choice of ethical food products, but also with regard to tourist destination competitiveness. A strong ethical image can only add value to a product or destination and so assist consumers in making product and destination choices.

NEW THOUGHTS ON LEADERSHIP IN TURBULENT TIMES

Hall, Roger¹; Rowland, Caroline²; Stokes, Peter²

¹Hall Consultancy, Manchester, UK

²Chester Business School, U.K.

ABSTRACT

Purpose In a turbulent economic climate, characterised by pressures to improve productivity and reduce costs, leadership and performance management have a more central role in helping to ensure competitive advantage. This paper explores current demands on leaders; and endeavours to explore linkages between management education and agile leadership.

Methodology. This paper uses the concepts of volatility, uncertainty, complexity and ambiguity (VUCA) to investigate the impact on desired attributes of leaders and the extent to which this is underpinned by current management education programmes in Europe. It draws on a range of theoretical frameworks to examine current practices and experiences and considers future trends. Empirical research includes case studies and analysis of management syllabuses.

Findings. Syllabuses do not reflect the attributes that organizations expect leaders to possess and are content driven rather than process focussed. VUCA is not yet mainstream in academic thinking.

Implications There is a disparity between the output of Business Schools and the expectations of Organizations. This may affect productivity.

Value This research opens an international debate that seeks to assess the relevance of current management education to the needs of organizations for agile, high performing leaders.

Keywords: *Leadership, Innovation, Sustainable, Learning, Management Development and Learning.*

INTRODUCTION

The acronym VUCA (Volatility, Uncertainty, Complexity, Ambiguity) has been used to describe the turbulence of the modern world of work. Its implications for managerial strategies have been explored and many organizations have embedded the concept in approaches to Human Resource Management, in particular in managing talent and in human resource development. What is less clear is the extent to which management education has adopted the concepts of VUCA in the design and delivery of programmes for future managers and leaders.

A VUCA world requires organizations to be agile, to be able to do different things in different ways quickly in response to change, implying an ability to learn. Knowledge itself has become transient due to the rapidity of change. Developments in Information Technology have made detailed knowledge much more widely available more quickly than in the past. Although a knowledge base for individual leaders and managers may still be important, it is less critical as behaviours which focus on agility and the personal attributes which underpin those behaviours.

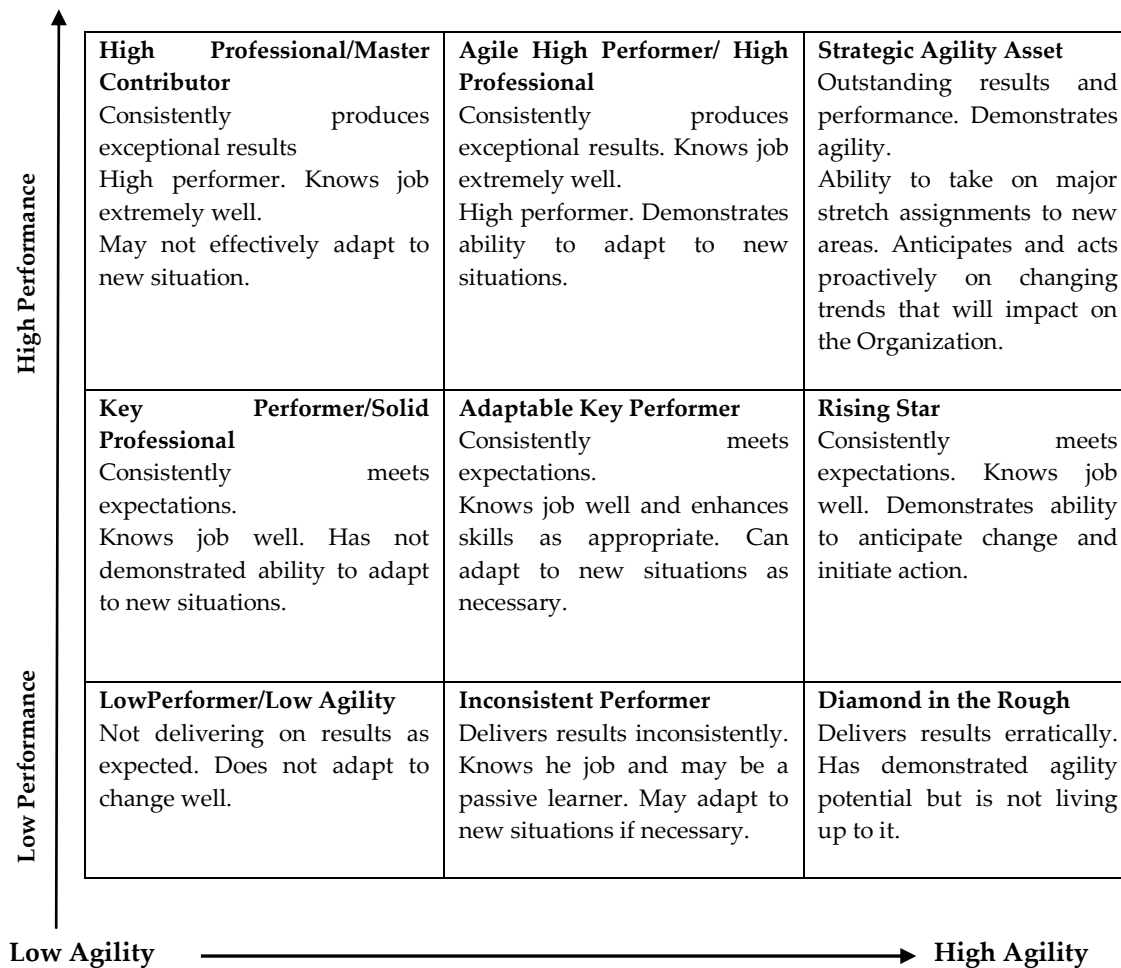

The authors are interested in the extent to which this change of focus has impacted upon management education. Are mainstream programmes such as MBAs content driven? Are there indications that behavioural learning is encouraged alongside cognitive development? Do Professional Bodies reflect the nature of a VUCA world and how far are their standards incorporated in HE programmes of study? Are MBA graduates, for example, capable of making an immediate contribution to their organizations as a result of their studies?

RESEARCH APPROACH

Leading now and in the future

This paper explores the way that leadership can enable people and Organizations to achieve targets and perform effectively. It also establishes links between management theory and practice with regards to both leadership and performance. In particular some aspects of current management thought are worth consideration. In the past decade academics led by business practitioners have started to focus more on Leadership Agility. This is seen as a prerequisite for success in the turbulent 21st century world of expanding global markets and the exponential rise of the digital technology and communication. The emphasis for the agile leader (Horney, Pasmore et al. 2010; Bennett and Lemoine, 2014) is grounded in the world of VUCA. The term VUCA was first coined by the US Army College to explain the dynamic nature of the world. The acronym VUCA stands for Volatility, Uncertainty, Complexity and Ambiguity. Agile leaders are responsive, innovative, and flexible but above all can anticipate change and are able to initiate action in work situations that feature rapid change and /or ambiguity.

A “Nine Box “model for reviewing performance and leadership agility may be seen below:

After Horney, Pasmore and O'Shea (2010)

The "Nine Box" review method assesses individuals on performance and leadership agility. All those considered as Strategic Agility Asset, Agile High Performer and Rising Star would all be considered as high contributors and potential leaders that should be given special access to developmental assignments, projects and training.

Research Issues

This paper examines the relationship between leadership, management education and the VUCA model of agile leadership. Its focus is where the three areas overlap.

It explores current models and professional practice and questions the requirements of both Business Schools and professional bodies in meeting the needs of leaders and managers in the workplace.

RESEARCH METHODS

A review of the history of management education was undertaken with particular emphasis on the UK experience. This was followed by an analysis of documents produced by regulatory, accreditation and professional bodies to identify the skills and behaviours embedded in programmes such as the MBA. These requirements were then compared with the skills and behaviours essential to the VUCA world.

FINDINGS

Management education

The history of management education in the UK is relatively short. In the USA Management has been a distinct discipline since the late nineteenth century, reflected in business school graduate programmes like the MBA. Until the 1960s in the UK, Management was taught as part of mainstream programmes and there were some Bachelor of Commerce degrees. It was also taught in technical colleges as part of professional body syllabuses. It was not until 1965 that the first business schools were established in Britain. This was prompted by the findings of the Robbins Report (1963) and the Franks Report (1963) which recommended the establishment of two business schools in London and Manchester.

Notwithstanding the rapid growth of business schools and their MBA programmes in the 1970s and 1980s the debate about the contribution of management education to the development of effective managers continued. There was a sense of a growing gulf between programmes designed by academics and the requirements of the world of work. One response to this was the production in the late 1980s of three reports about management education (Mangham and Silver, 1986; Constable and McCormick, 1987; Handy, 1987). A result of this was the Management Charter Initiative (MCI), which developed competence-based standards for managers at all levels. The focus was on criterion-based measurable competences rather than more generic competencies; national vocational qualifications in management were developed as part of the initiative. There was very little interest in the university sector and, although take-up by professional bodies and colleges of further education was reasonably high, it was also relatively short-lived.

MCI had made little impact on the perceived disparity between the outputs of business schools and the needs of organizations for effective managers. Some organizations remedied this through their own management development programmes but there was still a residual belief that MBAs in particular should address real managerial needs. Research, reports and commentaries over the last twenty years have emphasised this imbalance (Reed and Anthony, 1992; Casey, 1993; Macleod, 2000;

Crowe, 2000; Jeffcutt, 2008) the concern was not confined to the UK but also found resonances in Australia in the Karpin Enquiry (1995).

The latest in a long list of reports into the UK's management and leadership was published in 2014 (CMI, 2014). Entitled *Management 2020: Leadership to unlock long-term growth*, the report was a collaboration between the All-party Parliamentary Group on Management and the Chartered Management Institute to "investigate how management and leadership in the UK will need to change by 2020 to deliver sustainable economic growth." (CMI, 2014: p5.) The report begins with the state of UK management and leadership today, reflecting on the UK's poor competitive position and the perception of employees about their managers' ineffectiveness. Notwithstanding (or, perhaps, because of) substantial representation among witnesses and written submissions of academics and academic institutions, there is very little in the recommendations about how business schools might contribute to the desired improvements in management and leadership in 2020.

"Encourage business schools to include a significant period of experience within the workplace in the curriculum, and encourage the use of SME placements to better reflect the employment landscape. Ensure that interpersonal skills, such as communication, having a difficult conversation and coaching are taught and practised during these placements." (CMI, 2014: p52.)

So, although there is some mention of behaviours, these are not spelt out in detail and their development seems to be left to the workplace rather than being embedded in the curriculum. The report is, however, more forthcoming on the "top ten characteristics that managers need": (CMI, 2014: p30.)

1. Clear sense of purpose
2. Strong values and personal integrity
3. Commitment to developing others through coaching and mentoring
4. Champion of diversity
5. Ability to engage and communicate across all levels
6. Self-awareness and taking time to reflect
7. Collaborative, networked and non-hierarchical
8. Agile and innovative, technologically curious and savvy
9. Personal resilience and grit
10. Excellent track record of delivery

Although the report itself did not consider to what extent these characteristics are measurable, how they resonate with other taxonomies and whether business schools are developing them, these are, nonetheless, interesting questions worthy of further exploration.

Accreditation, regulatory and professional bodies

Many business schools, in order to differentiate themselves on the world stage in an increasingly competitive environment, have sought accreditation from one or more of the international bodies which accredit programmes of study or institutions. The three bodies we will consider are: The Association of MBAS (AMBA); European Foundation for Management Development Quality Improvement System (EQUIS) and; The Association to Advance Collegiate Schools of Business (AACSB). All three bodies, in addition to criteria surrounding the institution, its mission, governance, staff and students, also provide guidelines about the curriculum, including specifics about skills. For example, AMBA, which was founded in the UK but now accredits internationally, contains the following paragraph in its criteria for accreditation (AMBA, 2015: 18): “The programme must also be explicit about the means by which transferable and ‘soft’ management skills are developed throughout the programme. Such skills include, but are not restricted to: ability to manage change; communication; leadership; teamwork; dealing with ambiguity; negotiation; problem solving; critical thinking; values.”

EQUIS is the European Foundation for Management Education Quality Improvement System. It has a section dedicated to skills acquisition (EQUIS, 2015). Applicant schools are asked to “Describe the means by which transferable intellectual skills appropriate to higher education are integrated into the curricula.” (p 20) and to “Summarise the key managerial skills (team work, interpersonal skills, presentation skills, project management, leadership skills, etc.) which the School promotes in students and the methods used to achieve them.” (p21) In a section on students, EQUIS (2015: 29) makes the following statement: “In sum, business and management education institutions play a key role in developing personal awareness and the appropriate attitudes, values, skills and behaviours to equip students in their professional lives as managers. Schools should be able to demonstrate a concern for the type of managers they are trying to educate, backed by suitable processes for helping students to manage meaningful change, direct their energies and personal skills, and define their own future. As a consequence, the educational experience organised by the School should go much beyond classroom instruction and provide students with structured and monitored opportunities to develop the personal and professional qualities that have been defined as learning outcomes.”

AACSB, Founded in the US but accrediting internationally sets out the following general skills (AACSB, 2015: 31 - 32):

“General Skill Areas

- Written and oral communication (able to communicate effectively orally and in writing)
- Ethical understanding and reasoning (able to identify ethical issues and address the issues in a socially responsible manner)
- Analytical thinking (able to analyze and frame problems)

- Information technology (able to use current technologies in business and management contexts)
- Interpersonal relations and teamwork (able to work effectively with others and in team environments)
- Diverse and multicultural work environments (able to work effectively in diverse environments)
- Reflective thinking (able to understand oneself in the context of society)
- Application of knowledge (able to translate knowledge of business and management into practice)''

For general Master's degree programmes the following learning experiences are also expected

- “ • Leading in organizational situations
- Managing in a global context
 - Thinking creatively
 - Making sound decisions and exercising good judgment under uncertainty
 - Integrating knowledge across fields “

In the UK the Quality Assurance Agency (QAA) is the body responsible for standards and quality in higher education. It produces subject benchmark statements which “represent general expectations about standards for the award of qualifications at a given level in terms of the attributes and capabilities that those possessing qualifications should have demonstrated.” (QAA, 2007: iii)

The latest benchmark statement for Master's degrees in business and management was published in 2007 (QAA, 2007) and there are no current plans for revision. The overall objective of Master's level business and management degrees is described as “to educate individuals as managers and business specialists, and thus to improve the quality of management as a profession.” (QAA, 2007: 1)

Within that definition there is some emphasis on skills: “developing skills at a professional or equivalent level”; “the ability to apply knowledge and understanding of business and management to complex issues, both systematically and creatively to improve business and management practice” and; “enhancement of lifelong learning skills and personal development so as to be able to work with self-direction and originality and to contribute to business and society at large.” (QAA, 2007: 2)

Within MBA type degrees the main emphasis is on: “leadership through strategic management” with “a strong practical and professional orientation to the curriculum and they may be linked to professional institute qualifications.” (QAA, 2007: 3) Specifically: “Graduates will have been able to ground their new knowledge within the base of their professional experience. They will be able to reflect on and learn from that prior experience and thus be able to integrate new knowledge with past experience and apply it to new situations. They will be able to challenge preconceptions and to remove subject and functional boundaries so as to handle complex situations holistically. They should also have particular strengths in analysing, synthesising and solving complex unstructured business problems. In addition to being able to communicate their findings, they should have developed the

skills to implement agreed solutions effectively and efficiently. They should therefore have strongly developed interpersonal skills and to be able to interact effectively with a range of specialists.” (QAA, 2007: 5)

Professional bodies

There are several professional bodies in the UK covering leadership and management. Our focus is on the two chartered bodies, The Chartered Management Institute (CMI) and The Chartered Institute of Personnel and Development (CIPD). For CIPD Chartered membership involves demonstrating underpinning knowledge of Human Resource Management or Human Resource Development at Master’s level and demonstrating role-appropriate behaviours through an upgrading process. Not all of the required behaviours are confined to the upgrading process; there are skills and behaviours embedded in the units which form part of the curriculum taught and assessed in HE institutions. For example, the module *Developing Skills for Business Leadership* (CIPD, 2010) contains inter alia the following learning outcomes:

Manage interpersonal relationships at work more effectively; Lead and influence others more effectively; Demonstrate an essential people management skill set, comprising selection, appraisal and disciplinary interviewing, delivering training, making presentations, project management and managing poor performance.

In a similar way there is a separation in CMI between the requirements for Chartered status and the curriculum for postgraduate level awards. The former focus on behaviours and achievements whilst the latter provide underpinning knowledge and understanding. Nonetheless, there are skills and behaviours embedded within these units. For example, the module *Personal leadership development as a strategic manager* (CMI, 2013) contains inter alia the following: Be able to identify skills to achieve strategic ambitions; be able to manage personal leadership development; construct, implement, review and evaluate a personal development plan. There are detailed guidelines within each of the learning outcomes.

Leadership traditions

Leadership theory has traditionally seen the necessary attributes of a leader as being: vision and energy, (Bennis 1999); action, (Adair, 2002); charisma, and the capacity to lead change, (Bass, 2008). More recently sustainable and ethical aspects have been in spotlight (Cameron, 2014).

Most acknowledge the importance of the cultural context, but none present coherent models for turbulent times and few touch on ambiguity. Little attempt has been made to link leadership development and uncertainty through behavioural models emphasising coping mechanisms in time of flux.

DISCUSSION

Evidence from a succession of reports clearly indicates that UK management education and development fares badly in comparison with other developed countries. Yet, an analysis of the requirements of regulatory, accreditation and professional bodies, many of them with an international emphasis, indicates that UK business schools meet these standards and that, furthermore, those standards include some, at least, of the skills and behaviours which the reports have found lacking. This creates a contradiction which deserves further exploration.

There has been a long tradition in the UK and elsewhere for universities to be reluctant to embrace vocational education. Notwithstanding equally long traditions of preparing students for work in older professions such as medicine or law, that reluctance seems most prevalent in areas of management and business. Reflecting Newman's (1852) seminal writing on the idea of a university, Thorstein Veblen (1918) wrote compellingly about the secularisation of higher education in the USA at a time when business schools had been around for about thirty years. He argued that colleges of commerce emphasized individual gain and were "incompatible with the collective cultural purpose of the University" (p.154) and "a drain on its resources and an impairment of its scholarly animus." (p.155)

Whilst American business schools were first established in the nineteenth century (Wharton dates from 1881), there was a much greater resistance in the UK, perhaps reflecting Newman's ideas and Veblen's sentiments. The distinction between public and private good would later be muddled by the introduction of substantial student fees in the UK, mirroring the long-established position in the USA. It was not until 1965 that England's first business schools were established and later still that the schools at Oxford (1996) and Cambridge (2005) were founded. (There was a Management Studies section in the Department of Engineering at Cambridge as far back as 1954.)

Whilst the USA, Germany and France have been proud of their technical universities and polytechnics, the UK has not. In the 1960s many successful Colleges of Advanced Technology (CATs) were transformed into universities with a concomitant widening of the curriculum. In 1992 the then polytechnics became universities, doubling the provision.

Although business schools have grown in number since 1965, their vocational focus seems by many to have diminished. Mintzberg, for example, asserts:

"And business schools produce enormous quantities of research. Yet they are failing in their fundamental purpose, which is to enhance the quality of leadership in society." (Mintzberg, 2004: 377)

In the UK HE environment academics are increasingly judged by their research output, especially their contribution to the Research Excellence Framework (REF) rather than by the quality of their teaching. There has been considerable disquiet that academic research has had little impact on management practice (Tranfield and Starkey, 1998; Starkey and Madan, 2001; Keleman and Bansal,

2002: Ford et al., 2005: Brannick and Coghlan, 2006: Worrall et al., 2008; Rowland and Hall, 2010). Notwithstanding more recent assertions by the Association of Business Schools about the relevance of business school research (ABS, 2015), this concern about the perceived relevance of academic research may go some way to explain the contradiction.

A further explanation may be found in a more detailed examination of skills. Although there is mention of skills and even soft skills in the requirements of regulatory, accreditation and professional bodies, the precise nature of those skills is not made explicit.

Skills for a VUCA world

A comment by one of the commissioners for the All-Party Parliamentary Group on Management, which reported in 2014, emphasises the importance of these skills. At the CMI Manchester Lecture in February 2015 Professor Sir Cary Cooper stated that all the witnesses to the Commission cited poor soft skills as the major reason why the UK fall short in the leadership stakes. (Cooper, 2015)

British universities are well-versed in the development and assessment of cognitive skills but less well equipped to deliver behaviours consonant with the demands of a VUCA world. Excellence in the higher levels of the cognitive domain – analysis, synthesis, evaluation – is perhaps a necessary but insufficient condition for effectiveness as a manager or leader in dynamic environments. The experience and career paths of academics teaching in business schools are frequently embedded within these cognitive traditions. There are, to be sure, examples of staff who introduce activities such as action learning, T groups, neuro linguistic programming, transactional analysis, mindfulness or live consultancy projects to their students, but such initiatives are rarely mainstream and their passionate and enthusiastic advocates are often seen as mavericks by their colleagues.

Although, as noted previously, regulatory, accreditation and professional bodies do include skills in their requirements, it seems as though these are interpreted by many universities as cognitive skills much as all the problems encountered by a hammer are seen as nails. Universities have the capability to address cognitive skills but not to deliver with the same degree of effectiveness in the affective and behavioural domains critical to management and leadership in a VUCA world.

As Donald Schön points out:

“In the varied topography of professional practice, there is a high, hard ground where practitioners can make effective use of research-based theory and technique, and there is a swampy lowland where situations are confusing ‘messes’ incapable of technical solution. The difficulty is that the problems of the high ground, however great their technical interest, are often relatively unimportant to clients or to the larger society, while in the swamp are the problems of the greatest human concern.” (Schön, 1983: 42)

It is not unreasonable to suggest that business schools are on that high, hard ground and rarely venture into the swamp to address concerns such as those presented by a VUCA world. Bennett and Lemoine (2014) provide a guide to identifying, getting ready for and responding to events in each of the four VUCA categories. For example, they suggest; restructuring and developing specialists to respond to complexity; experimentation to address “unknown unknowns”; building in slack and devoting resources to preparedness to deal with unexpected challenges and; investing in information to counter uncertainty.

Johansen and Voto (2013) identify skills that provide competitive advantage in a VUCA world: empowering leaders to rethink current ways of doing business and seed new innovations; clarity of intent and flexibility in how to achieve that intent; exploring dilemmas to find the best way forward; organising groups of people brought together for a business or social change purpose, making savvy use of available media; using the ecological metaphor of systems theory to reorganise and guide effective teams and: the ability to make common cause with others for mutual benefit through sharing of assets. There is little evidence of these skills in the guidelines of the various overseeing bodies or the curricula of universities delivering programmes in management and leadership.

A long-established method of teaching in business schools is the use of the case study, first developed at Harvard but now universally in use. The skill of writing case studies lies in the ability of the writer to capture succinctly the essence of a situation. This necessarily involves some simplification of complexity and, to some extent, reduction of ambiguity. The freezing in time removes some volatility and perhaps some uncertainty. The case study becomes a sanitised simulacrum of the situation. It encourages the development of cognitive skills of analysis, synthesis and evaluation but may bear little relationship to managerial situations where complexity, uncertainty, ambiguity and volatility are in evidence.

CONCLUSIONS

Although there is some recognition in the curricula of both higher education providers and professional bodies that leaders and managers need to possess skills to enable them to cope with uncertainty and change little seems to be embedded in mainstream management development.

Currently educational establishments are not responding enough to the needs of a fluctuating business landscape. Management education is being disadvantaged by entrenched adherence to outdated processes and behaviours that often focus on stability rather than uncertainty and flux.

This exploratory research finds that the UK experience may very well be typical. However, more international comparisons need to be made.

Organizations are operating in a world of rapidly changing scenarios. They are under constant pressure to improve productivity and reduce costs. Effective leadership is a crucial component of helping to ensure competitive advantage by ensuring high performance. Current management thought emphasises a clear need for strategy that recognises important linkages between leadership and performance in flexible and responsive actions that reflect the context of volatile political, economic and technological circumstances

Performance management should ultimately be about performance enhancement. We need to understand the difference between leadership and management. This will enable us to take on either role (or both) to facilitate conditions that ensure people can achieve their best and remain motivated to do so. Herzberg recognised that by treating people the way they are rather than the way we want them to be we have a chance to motivate them. There are many tools that can be used to support efficiency and effectiveness but to achieve lasting success we have to recognize that changing circumstances require a change in skills and attitudes.

IMPACT OF WORK-PLACE INCIVILITY ON HORIZONTAL SOLIDARITY AND PERCEPTIONS OF JOB-INSECURITY

Heilbrunn, Sibylle¹; Itzkovich, Yariv²

²The Department of Multi-Disciplinary Studies, Kinneret Academic College on the Sea of Galilee, Zemach, Israel

ABSTRACT

Drawing on the exchange model and Lazarus' theory of cognitive appraisal we investigated the relationship between perceived incivility and two possible outcomes – horizontal solidarity and perceptions of job-insecurity, while differentiating between two separate sources of perpetrators. Hypothesis one maintained that incivility perpetrated by managers will not impact the exchange relationship with the target's co-workers as they are not part of the exchange. Nevertheless, following the social exchange theory, when co-workers perpetrate the uncivil act, solidarity with co-workers will be damaged. Drawing on theory of cognitive appraisal, hypotheses two suggested that incivility will be assessed as a threat to employees' job-security when a manager perpetrated the uncivil encounter, yet when the uncivil encounter is perpetrated by a peer, incivility will not lead to emotional perception of job insecurity as the target will have more resources to cope with the uncivil encounter.

Data were collected in 2014 in Israel. We distributed an on-line questionnaire and received 648 valid responses. The data were analyzed using structural equational modeling. The model's goodness of fit data indicated a very good fit. Implications and limitations are discussed.

Keyword: *Work-place incivility, horizontal solidarity, job insecurity, social exchange model, theory of cognitive appraisal*

INTRODUCTION

Over the last decades the labor market has extensively changed as processes of globalization impose new rules of competition on employers worldwide. Central manifestations of these developments are the 'precarious class' (Standing, 2011) related also but not only to new forms of occupations due to technological innovations (e.g. call centers), new types of production systems (e.g. lean production) and additional organizational and structural changes such as downsizing, outsourcing, privatization of formerly public services (Landsbergis, et.al. 2014). Furthermore the proportion of employees holding

union membership declines (Kalleberg, 2009). Due to increasing complexity of work relations, namely changing labor market conditions and changing organization of work, the investigation of behaviors and perceptions such as co-worker solidarity, job insecurity and incivility is extremely important. The purpose of the here presented paper was to investigate two related research questions concerning the impact of incivility perpetrated by either managers or co-workers on perceived job insecurity and horizontal solidarity.

THEORETICAL FRAMEWORK

Cropanzano and Mitchel (2005) reviewed various applications of social exchange theory (SET) and noted that although the norms of reciprocity are originally used for explaining interpersonal relations between two individuals, it can well be applied to social interactions between various groupings of actors including between individuals and organizations (Cropanzano & Mitchel, 2005). This extended approach to interpersonal relationships in organizations was later adopted by scholars using SET framing such as Aryee, Walumbwa, Mondejar and Chu, (2013) investigating the impact of justice perceptions of employees on performance, and Paillé, Grima and Dufour (2012) investigating the impact of support on intentions to leave. Such a wider perspective is missing in the research arena of incivility, which primarily focuses on interactions between individuals (Schilpzand et al., 2015). The basic principles of SET postulate that individuals estimate their exchange with the organization. Once these exchange relationships are perceived as valuable, individuals reciprocate in a manner that is valuable to the organization (Aryee et al., 2013; Paillé et al., 2012). This constitutes the bright side of organizational behavior. This line of thought is well developed in the research of organizational citizenship behavior (Cropanzano & Mitchel, 2005; Paillé et al., 2012). Alternatively, if one of the parties perceives the transaction as negative, on the grounds of the same but now negative norm of reciprocity (Helm et.al. 1972), the other partner to the exchange will react negatively (Cropanzano, & Mitchel, 2005). This alternate line of argumentation refers to the dark side of organizational behavior and researchers found that frequent experiences of coworker incivility is related to increased adverse feelings and decreased work effort (Sakurai & Jex, 2012). These findings demonstrate the darker path of SET, but also indicate that the impact of co-workers' support (or lack of support) goes beyond the boundaries of dyadic interactions.

Incivility was first defined by Andersson and Pearson (1999) as "low-intensity deviant behavior with ambiguous intent to harm the target, in violation of workplace norms for mutual respect" (p. 457). While civility is demonstrated through adequate interpersonal interactions, incivility is represented through inappropriate social encounters (Pearson & Porath, 2005), either active as in the case of public criticism or passive as in the case of silent treatment (Hershcovis, 2011). Incivility is distinct from other

interpersonal mistreatment by two main criteria: Firstly, incivility is low-intensity deviant behavior (Andersson & Pearson, 1999; Pearson & Porath, 2005). The meaning is that compared to high-intensity behaviors such as bullying or aggression, incivility represents a milder form of interpersonal mistreatment (Cortina, Magley, Williams, & Langhout, 2001; Pearson et al., 2000; Pearson, Andersson, & Wegner, 2001). The second criterion which distinguishes incivility from other forms of interpersonal mistreatment is its ambiguous intent to harm, its target (Sliter, Sliter, & Jex, 2012; Trudel, & Reio, 2011). Thus, incivility is subjective in nature and therefore each one of the parties to an uncivil encounter, can interpret reality in a different manner, which eventually leads to differences in attribution of intent. While some targets of incivility perceive it as intended, others might not (Gallus et al., 2014; Sliter et al., 2012). In any case, recent research regards incivility to be a job-stressor (Kern & Grandey, 2009).

Following Lazarus and Folkman's (1984) appraisal theory there are two types of coping responses to work stressors: emotion focused and problem focused. The response depends upon the appraisal of the situation as either harmful threatening or challenging and upon the appraisal of coping resources. Problem solving responses are based on capabilities to manage the stressful situation due to positive evaluation of external and internal coping resources. Emotional responses are based on perceptions of deficiency of these coping resources (Brown, Duck & Jimmieson, 2014; Folkman, 2010; Lazarus & Folkman, 1984).

Possible outcome of work related stress is perceptions of job-insecurity (Brockner & Wiesenfeld, 1993; Jacobson, 1991). While job security is perceived as a motivational factor or an antecedent of job-satisfaction (Rosenblatt & Ruvio, 2000), job-insecurity is considered to be a forecaster of dysfunctional personal feelings such as weakened perceptions of general health (Bernard Oettel, De Cuyper, Schreurs, & De Witte, 2011), as well as a predictor of dysfunctional organizational attitudes and behaviors such as decline in affective commitment (Vander Elst, De Cuyper, & De Witte, 2011; Vander Elst, De Witte, & De Cuyper, 2014), decreased performance and increased withdrawal intentions (Greenhalgh & Rosenblatt, 1984). Job insecurity was defined by some researchers as the "powerlessness to maintain desired continuity in a threatened job situation" Greenhalgh and Rosenblatt (1984, p. 438) or as a "discrepancy between the level of security a person experiences and the level she or he might prefer" Jacobson and Hartley (1991, p 1431). By stressing that job- insecurity refers to the gap between the desired level of security and the perceived level of security in relation to job's characteristics over and above the overall continuity of the job as a whole, Greenhalgh and Rosenblatt (1984), embraced a wider, multi-dimensional approach to job insecurity which is not limit to one dimension of job insecurity centering around the continuity or discontinuity of the job, but can also be a potential

outcome of any threat sourcing from variety of working conditions (Ruvio and Rosenblatt, 2000), thus inferring that uncivil working conditions can also produce job insecurity perceptions.

Drawing on Lazarus and Folkman appraisal theory (1984), and the multi-dimensional approach to job insecurity it is reasonable to posit that uncivil encounters will be interpreted by targets as threats to their job security in those situations in which they feel they do not have resources to cope with these threats. Therefore it is safe to assume that when a manager perpetrates the uncivil act, it will be perceived as imposing job insecurity. The manager is in charge of the majority of the socioeconomic resources of his employees. Incivility perpetrated by a manager might therefore be perceived as an indication of future loss of resources. This however is not the case when uncivil acts are perpetrated by peers who are not in charge of the target's actual and potential resources. Thus, incivility from peers will not be perceived as a threat to one's job security.

Hypothesis 1: Incivility will be assessed as a threat to employees' job-security when a manager perpetrated the uncivil encounter, yet when the uncivil encounter is perpetrated by a co-worker, incivility will not lead to emotional perception of job insecurity.

Solidarity refers to a situation in which the well-being of one person or group is positively related to that of others, indicating mutual interdependence (De Beer & Koster, 2009: 12). Solidary behavior is defined as the degree to which employees help colleagues (horizontal) and the manager (vertical) to complete a task, the degree to which employees are trying to recover mistakes during work, the extent to which employees make an apology when they make mistakes and the extent to which the employee has fairly shared tasks and fulfils agreements (Koster and Sanders, 2006). Solidarity implies the contribution of private resources without expecting financial compensation in order to realize collective purposes and therefore Koster and Sanders (2006) maintain that horizontal solidarity concerns behaving agreeably with co-workers even when it is not convenient or formally pronounced. The willingness to help others is largely a feature of the relationship between people (Koster and Sanders, 2006; Sanders, Emans and Koster, 2004) and therefore – applying the principles of SET – an employee may behave in a solidary manner in one relationship and not so in another relationship (Sanders, 2005). The experience of incivility and especially its source in terms of perpetrator, can explain solidarity behavior between co-workers. Drawing upon SET an uncivil encounter between employees and managers should not influence horizontal solidarity between co-workers, since managers are not part of these exchange relationship. But when co-workers perpetrate uncivil behavior we expect a negative impact on horizontal solidarity.

Hypothesis 2: Incivility perpetrated by managers will not impact horizontal solidarity while co-workers' incivility will decrease horizontal solidarity.

METHOD

Data for the study were gathered in 15 organizations of various types located in Israel by students enrolled at the time of data collection in seminars on organizational behavior in three colleges geographically located in the North, South and center of Israel. The students approached working adults from different industries and occupational status to take part in our study, which is - following Lim & Lee (2011) an acceptable sampling method. The survey was administered via a web link in 2014, accompanied by a cover letter stressing the importance of the research, encouraging them to respond truthfully, and assuring their complete anonymity. The final sample consisted of 684 individuals, after we excluded participants who answered to less than 30% of the survey items. 60% of the sample population was male and 40% female, with an average age of 35 (SD = 10.1) ranging between 19 and 70. 84% were employed on a permanent basis and 16% were temporary employees. The mean years of employment of the survey participants was 6 (SD = 6.4) ranging from 1 to a maximum of 45 years.

In order to ensure construct validity we employed principle component analyses using varimax rotation and reliability tests to all three scales.

The work incivility scale (WIS) developed by Cortina et al. (2001) was used in order to measure incivility perceptions. The scale consists of seven items on a five point Likert scale ranging from 1= "nearly never" to 5= "most of the time". Participants were asked "During the past year have you been in a situation where any of your supervisors or co-workers:" Sample items were "Put you down or was condescending to you?" "Paid little attention to your statement or showed little interest in your opinion?" The final Cronbach's alpha of the sub factor was equal to .870.

In order to measure job insecurity we used the Vander Elst et.al. (2014) scale. The scale consists of four items on a five point Likert scale ranging from 1 = strongly disagree to 5 = strongly agree. Sample items were "Chances are that I will soon lose my job", and "I am sure that I can keep my job". The final Cronbach's alpha of the sub factor was equal to .731.

Based on Koster (2005), we used the following five items to measure solidarity toward co-workers: (1) "I help my co-workers to finish tasks"; (2) "I am willing to help my co-workers when things go wrong unexpectedly"; (3) "I apologize to my co-workers when I have made a mistake"; (4) "I try to divide the pleasant and unpleasant tasks equally between myself and my co-workers"; and (5) "I live up to

agreements with my co-workers" (Koster, 2005: 127). The Cronbach's alpha of the constructed horizontal solidarity index was .815.

FINDINGS

Table 1 illustrates the descriptive statistics of the research variables.

	<i>M</i>	<i>SD</i>	1	2	3	4	5
1. Horizontal solidarity	4.12	.64	(.815)				
2. Incivility	1.72	.70	-.16**	(.870)			
3. Job insecurity	1.85	.84	-.15**	.26**	(.731)		
4. Gender	1.4	.491	.03	.04	-.09*	.02	
5. Age	35.74	10.13	.06	.04	-.07*	-.12**	.02

Note: N = 684. Gender coded 1 = male, 2 = female. Coefficient alpha for each scale is in parentheses.

* $p \leq .05$ ** $p \leq .01$

Table 1: *Descriptive Statistics and Correlations*

Structural equation modeling (SEM) was employed to test the research hypotheses. Data used for the SEM were analyzed with the maximum likelihood method. Three fit indices were computed in order to evaluate the model fit: $\chi^2(df)$ ($p > .05$), *CFI* (> 0.9), and *RMSEA* ($< .08$). The measurement model includes the following factors: The work incivility scale (WIS), latent variable with seven observed variables; horizontal solidarity, latent variable with five observed variables; and job insecurity scale (JIS) latent factor composed of four observed variables.

The path model was constructed as follows: paths were specified between incivility horizontal solidarity and job insecurity. In addition sample was divided into two separate groups which were distinct by perpetrator's status. The first group (i.e. group 1) comprised those individuals who were perpetrated by coworkers while the second group (i.e. group 2) constitute individuals who were perpetrated by their direct manager. The goodness of fit of the data to the model yielded very good fit results ($\chi^2 = 438.219$ [$df = 198$], $p = .000$; *CFI* = .940; *RMSEA* = .043). Specifically, for group 1 the results showed a negative (moderate) significant coefficient between WIS and horizontal solidarity ($\beta = -.32$, $p < .001$), and for group 2 results indicate a low negative connection between incivility and horizontal solidarity ($\beta = -.17$, $p < .005$) and positive moderate connection between incivility and job insecurity. In total, in group 1 in which co-workers perpetrated the uncivil behavior (figure 1) incivility perceptions explained 10% of the horizontal solidarity's variances, while for group 2 (figure 2) in which managers perpetrated the uncivil behavior incivility perception explained 3% of the variance of horizontal solidarity and 14% of the variance in job insecurity.

Note: * $p < .05$ ** $p < .01$ *** $p < .001$

Figure 2. The structural model, with standardized parameter estimates for group 2 (N= 475)

DISCUSSION AND CONCLUSIONS

In order to account for increasing complexity of work relations in terms of changing labor market conditions and changing organization of work, the purpose of the here presented paper was to investigate two related research questions concerning the impact of incivility perpetrated by either managers or co-workers on perceived job insecurity and horizontal solidarity.

Specifically we hypothesized that incivility will be assessed as a threat to employees' job-security when a manager perpetrated the uncivil encounter, yet when the uncivil encounter is perpetrated by a co-worker, incivility will not lead to emotional perception of job insecurity. Additionally we expected that incivility perpetrated by managers will not impact horizontal solidarity while co-workers' incivility will decrease horizontal solidarity.

Based on the path models results, both hypotheses were accepted. In addition we found that uncivil behavior perpetrated by managers caused a minor negative impact on horizontal solidarity. It could be

that the overall impact of uncivil behavior on target persons influences the perception of reciprocity also indirectly, thus reducing – if only to a small degree – cooperative behaviors of organizational members. An additional plausible explanation could be related to the psychological and physical well-being: a number of studies found that exposure to incivility negatively impacts the psychological and physical wellbeing of employees exposed to incivility (Hershcovis, 2011; Miner & Eischeid, 2012; Gallus et al. 2014; Porath & Pearson, 2012).

To the best of our knowledge there are very few – if at all - studies investigating the impact of incivility on job insecurity. Only very few studies differentiate between different sources of incivility and even fewer distinguish between the potential diverse impact of different sources (Schilpzand et.al. 2015; Itzkovich, 2014). Our study not only addresses this lack but also accounts for different impacts of perpetrators positioned as managers versus peers in the organizational hierarchy, thus contributing to the research agenda on incivility and its organizational outcomes.

In addition, to date there is no research assessing the relationship between incivility and organizational solidarity, and that despite of the fact that cooperative behavior of employees is a critical factor in the changing landscape of labor market relations and is assumed to reduce uncivil behaviors in organizations. Accounting for the relationship between these variables concerns an additional contribution of our study.

The main limitation of this study concerns its cross sectional design, which limits the option to infer causality between the variables. Further research should deal with this limitation. Indeed, only Porat and Erez (2007; 2009) used an experimental design dealing with the limits of cross sectionalism. In addition future research should investigate solidarity and incivility while considering them as poles on one continuum of organizational behavior, thereby adding to the theoretical agenda.

UNEMPLOYMENT AND INFLATION RATES IN THE YEARS OF ECONOMIC TURBULENCES OR DO THE PHILLIPS CURVE RELATIONSHIPS STILL HOLD?

Hindls, Richard¹; Hronová, Stanislava²

¹Faculty of Informatics and Statistics, Department of Statistics and Probability, Czech Republic

²Faculty of Informatics and Statistics, Department of Economic Statistics, Czech Republic

ABSTRACT

The Phillips curve is a well-known and widely discussed notion. This relationship between the unemployment and inflation rates was quickly transferred from the area of economic theory to the practice of economy, that is, of central banks. However, it has been gradually discovered that this relationship only expresses economic interdependence at a certain moment of time and a certain point in space. New economic phenomena raise doubts about its validity on not only the long-term, but even the short-term scale. From the viewpoint of statistics, each statistically proven relationship is only valid in the given time and space and cannot be mechanically applied under different conditions. This relationship is also statistically dubious regarding the independent and dependent variables. This paper points out certain statistical ambiguities related to applications of the Phillips curve and provides a test of significance for a set of 30 countries in the period from 2003 to 2014 to show that the inflation rate only weakly responds to changes in the unemployment rate; that is, the Phillips curve relationships are not valid.

Keywords: *Phillips curve, unemployment rate, inflation rate, test of significance of changes*

INTRODUCTION

The Phillips curve, expressing the relationship between the rate of unemployment and rate of inflation, has undoubtedly been one of the most disputed postulates of economics. The original notion was formulated by A. W. Phillips (Phillips, 1958) in 1958 as a relationship between wages and the unemployment rate; later it was modified to that between the inflation and unemployment rates. This generalisation of the relationship, first pointed out by I. Fisher (Fisher, 1973) as early as in 1926, gave a strong impulse to later considerations by central banks with respect to estimating the inflation rate on the basis of the unemployment rate.

The pricing Phillips curve has, for many years, been understood as a stable economic formula whose validity was taken for granted by many creators of economic policies and representatives of central banks. The simplicity of shaping the policy by influencing the unemployment via support of demand, thus regulating the price increase, was rather tempting. Relative stability of prices seen after World War II lulled the fears of a high inflation rate; the economic growth was high and the unemployment low. The change of economic conditions in the 1970s (oil crisis, changes in the structure of the labour market, growth of work productivity, development of information technologies, inflation targeting) led to disillusion from inability to make use of the inversion relationship between the inflation and unemployment rates on a long-term basis. In other words, one of the most important economic notions, often taken as a law, ceased to be deemed valid. M. Friedman (Friedman, 1968) and E. Phelps (Phelps, 1967) recapitulated reasons for that fact. It was necessary to accept that unemployment is a result of a number of economic processes and cannot be controlled just by changes in aggregate demand. Behaviour of central banks based on expectations about the inflation rate also played an important role in the departure from the Phillips curve. Such expectations considerably distort the relationship between the unemployment and inflation rates because the expected inflation rate affects behaviour of economic subjects, which substantially determines the actual inflation rate. Nonetheless, M. Friedman and E. Phelps admit that the Phillips curve relationship does hold, but it is accompanied by expectations of growing inflation.

Later, in (Atkeson and Ohanian, 2001) or (Lansing, 2002), the ability of the Phillips curve relationship to predict the inflation even on a short-term basis was disputed. Atkeson and Ohanian showed that it is inaccurate and unsuitable to predict the inflation rate on the basis of the unemployment rate and, when subsequently verified, it may bring good results more or less at random. Quick changes in the economic conditions in recent decades indicate that the relationship, which was observed as a statistical dependence formula in the conditions of the United Kingdom from mid-19th to mid-20th centuries, cannot be applied to the modern and quickly changing economies.

STATISTICAL VIEW OF THE PHILLIPS CURVE

Nonetheless, we should recall that the relationship between the inflation and unemployment rates was derived from a statistical inter-relation between these variables. Phillips took the unemployment rate as the dependent variable (it is interesting to point out that I. Fisher viewed the inflation rate as the dependent variable, cf. Fisher, 1973). However, discussions over this relationship have often interpreted the relationship as reciprocal, and economic arguments for taking the unemployment rate as the dependent variable were given hardly any attention.

The relationship was understood as a trade-off; that is, lower unemployment makes prices go up faster and a rapid price increase is connected to a lower unemployment rate. This view is easy to grasp for an economist, but hard to understand for a statistician. Another difficult point arises in situations when the decreasing Phillips curve intersects with the x axis. The intersection is often interpreted as the natural value of the unemployment rate, i.e., the value at which the inflation rate is zero. If the unemployment rate is lower than this natural value, the inflation rate grows when the unemployment rate goes down. However, if the unemployment rate exceeds that natural value, the inflation rate is negative. In other words, does increasing unemployment above the natural value cause deflation? This situation, implied by the many-times published graphical shape of the Phillips curve, has never been commented on. Neither has it ever been said that the validity of the Phillips "law" was restricted only to a certain range of the unemployment rate (as the dependent variable) or a certain domain of the inflation rate (as the independent variable).

From the statistical viewpoint, we can say that dependence observed in one country for a long time was not only wrongly (from the economic viewpoint) generalised to a different time and a different territory, but, without proving the factual economic connection and mathematical correctness of the said relationship, it has been employed in formulation of economic policies. It should have been more than clear that this approach is bound to fail in due time. Existence of a statistically proven dependence does not imply that this dependence is causal (we often encounter this problem in medicine: despite a proof of a statistical dependence, doctors are often unable to reveal its cause). We need not recall that two variables may also be inter-dependent only apparently, via the influence of a third variable (either known, or well hidden).

A significant statistical aspect of doubts about applying the relationship between the unemployment and inflation rates that used to be valid from mid-19th to mid-20th centuries (or to even regard it as a law) is given by the contents of these indices. Both their definitions and the methods for their determination have substantially been changed several times since Phillips' work was published. Consequently, their values, interpretations and ability to reflect reality have been changed with respect to what was true 100 years ago.

One more fact is worth mentioning. Phillips and other economists formulated their considerations in times when economies of individual countries were not nearly as inter-connected as today. For example, unemployment was then much less affected by migration of people to get work – this migration is virtually unlimited nowadays. On the other hand, production processes were not as easily moved to get a less expensive labour force (in our times, for example, it is quite common to build new technological units or even factories in countries with a lower cost of labour, etc.). Price evolution in

individual countries is also very tightly inter-connected, not only due to the existence of the Euro. Mechanisms of international trade and international marketing are much more often utilised by large companies which exist in the space of multinational consolidation, tax systems, etc.; all such aspects affect price evolution as well. Hence, Phillips postulates and other rules cannot be related to a sole country or a small group of countries but a methodology must be created to enable us to comprehensively evaluate any (large) number of countries with respect to mutual changes of their values of the unemployment rate and their price levels.

A critical statistical view of the Phillips curve and its utilisation has led us to question whether a common statistical tool would or would not be able to disprove the validity of the trade-off relationship between the unemployment and inflation rates, and evolution of one of the rates does not enable us to predict the evolution of the other. It was clear to us that a critical view of the Phillips curve must consider not only a longer period of time (also covering years of economic growth and those of recession or crisis) but also a number of countries; and our statistical apparatus will have to be able to assess whether the inflation rate does or does not respond to the changes in the unemployment rate in the expected way. The authors have chosen a test of significance of changes, developed by themselves, for the statistical tool needed.

METHODOLOGY OF ANALYSIS

As already mentioned above, the relationship between the unemployment and inflation rates is not easy to assess for many countries. We will use an original statistical test we published in (Hindls and Hronová, 2007). This test can be applied to any number of countries. As the first approximation, we took the unemployment rate (variable UNEM, in %) and inflation rate (variable INFL, in %) data from the Eurostat database for 30 selected European countries in the years from 2003 to 2014 (cf. <http://ec.europa.eu/eurostat/data/database>).

Hence we assume that we have the UNEM and INFL values in our group of $n = 30$ countries. The data is not static, we have time series of them, with a length of $m = 12$ (years). Now we suggest a statistical test enabling us to objectively assess significance of mutual total changes in the variables UNEM and INFL in the period of 2003 to 2014. Thus we will be able to formulate a summary conclusion concerning the relationship between the unemployment and inflation rates over many years and many countries.

Let us denote the UNEM percentage value for the i th country by symbol x_i . Similarly, y_i , $i = 1, 2, \dots, n$, will denote the INFL percentage values, and n stands for the number of countries. The first year of our analysis will be denoted by "1" (it will be 2003 in our particular instance), the second year by "2" (i.e., 2004 in our case). Later we will analyse the entire period of 2003 to 2014.

In other words:

- symbol x_{1i} stands for the value of UNEM in the i th country, $i = 1, 2, \dots, n$, (in our case it is $n = 30$) in the 1st period (year 2003),
- symbol x_{2i} stands for the value of UNEM in the i th country, $i = 1, 2, \dots, n$, ($n = 30$) in the 2nd period (year 2004),
- symbol y_{1i} stands for the value of INFL in the i th country, $i = 1, 2, \dots, n$, in the 1st period (year 2003),
- symbol y_{2i} stands for the value of INFL in the i th country, $i = 1, 2, \dots, n$, in the 2nd period (year 2004).

Each of the n countries is thus evaluated in light of value pairs UNEM (= x) and INFL (= y) in two different periods (here, two different years). Table 1 contains the original data about the annual inflation and unemployment rates for years 2003 and 2004 $x_{1i}, x_{2i}, y_{1i}, y_{2i}$ (in %) taken from the Eurostat database (cf. <http://ec.europa.eu/eurostat/data/database>); Table 1 also contains calculations.

Furthermore, we will introduce the following notation:

- K_1 is the mean values (the so-called mean spatial localisation) of both observed indices, UNEM and INFL, in the 1st period (here, year 2003), that is, the mean value of all distances of points $[x_{1i}; y_{1i}]$ (x, y), from the beginning $[0; 0]$ in the Cartesian coordinates (x, y) – cf. Formulas (2) and (3) below;
- similarly, K_2 is the mean values (the so-called mean spatial localisation) of both observed indices, UNEM and INFL, in the 2nd period (here, year 2004), that is, the mean value of all distances of points $[x_{2i}; y_{2i}]$ from the beginning $[0; 0]$ in the Cartesian coordinates (x, y) – cf. again Formulas (2) and (3) below.

The test is formulated as follows:

First Step

Test the zero hypothesis H_0 that both values of the mean spatial localisation in the two-dimensional Cartesian coordinates are mutually equal, i.e.

$$H_0: \quad K_1 = K_2 \quad (1a)$$

against alternatives

$$H_1: \quad K_1 \otimes K_2 \text{ (bilateral alternative),} \quad (1b)$$

or

$$H_1: K_1 \otimes K_2 \text{ (right-hand-sided alternative),} \quad (1c)$$

or

$$H_1: K_1 \otimes K_2 \text{ (left-hand-sided alternative).} \quad (1d)$$

Second Step

The test criterion is the statistic

$$t = \frac{\frac{\sum_{i=1}^n k_i}{n}}{\sqrt{\frac{\sum_{i=1}^n \left[k_i - \frac{\sum_{i=1}^n k_i}{n} \right]^2}{n(n-1)}}}, \quad (2)$$

$$\text{where } k_i = \text{sign}\{y_{2i}^2 + x_{2i}^2 - y_{1i}^2 - x_{1i}^2\} \sqrt{(x_{2i} - x_{1i})^2 + (y_{2i} - y_{1i})^2}, \quad (3)$$

$$\frac{\sum_{i=1}^n k_i}{n} \text{ is a point estimate of the statistic } K_2 - K_1. \quad (4)$$

The test utilised here, cf. Formulas (2), (3), and (4) is a test for equality of mean values for two dependent samples. The statistic given in Formula (2) has, under hypothesis H_0 , Student's t -distribution $t[n-1]$; see (Cyhelský *et al.*, 1999) for more details.

Operator $\text{sign}\{\dots\}$ determines the sign of the "total spatial" change (" \otimes ") in the level of two-index evaluation in the second (later) period (year 2004 here) as compared with the first period (year 2003). Hence the sign operator here expresses whether the i th spatial localisation values (i.e., the value for the i th country) in the 2nd period (year 2004) was closer to („–“) or further from („+“) the origin $[0; 0]$ in comparison with the 1st period (year 2003). For example, if the i th spatial localisation is further from the origin $[0; 0]$, the "+" sign says that the *total* (for both UNEM and INFL together) position in the i th country moved further from the origin $[0; 0]$. Of course, the "–" sign corresponds to the opposite situation of getting closer to the origin $[0; 0]$.

Third Step

The critical area W of our test is defined by the following inequalities:

$$W = \left\{ \begin{array}{l} |t| \geq t_{1-\alpha/2}[n-1] \\ t \leq t_{\alpha}[n-1] \\ t \geq t_{1-\alpha}[n-1] \end{array} \right\}, \quad (5)$$

where $t_{\alpha}[n-1]$ are the quantiles of Student's t -distribution, and α is the level of significance.

Fourth Step

On the basis of the Third Step's result we can, on the chosen level α of significance, formulate our conclusion about the statistical significance of the change in values UNEM and INFL as a total of all $n = 30$ countries under consideration.

Country	x_{1i}	x_{2i}	y_{1i}	y_{2i}	x_{1i}^2	x_{2i}^2	y_{1i}^2	y_{2i}^2	h_i	V_i	k_i	$(k_i - k_{average})^2$

Table 1. Calculation table – comparison between years 2003 and 2004

Comment: we have introduced auxiliary notations for the sake of simplicity:

$$h_i = \sqrt{(x_{2i} - x_{1i})^2 + (y_{2i} - y_{1i})^2}, \text{ and } V_i = y_{2i}^2 + x_{2i}^2 - y_{1i}^2 - x_{1i}^2.$$

RESULTS OF ANALYSIS

Our analysis (cf. Table 2) is an illustration of comparing years 2003 and 2004. In the actual testing of the above-mentioned zero hypothesis (1a) against bilateral alternative (1b) the chosen level of significance is $\alpha = 0.05 = 5\%$. With the aid of the described procedure and making use of the data and calculation Table 1 we get, for the test statistic t :

$$t = \frac{\frac{-5,1247}{30}}{\sqrt{\frac{99,8846}{30 \cdot 29}}} \doteq -0,5042.$$

For the bilateral alternative H_1 given as (1b), the corresponding quantile of Student's t -distribution is $t_{0.95}[29] = 1.699$. According to (5) we get $|\pm 0.5042| = +0.5042 < 1.699$. We therefore do not reject the hypothesis H_0 given in (1) saying that the mean spatial localisations are mutually equal, i.e., the difference between the UNEM and INFL values between years 2003 and 2004 is statistically insignificant for the chosen 30 countries.

The value of the test criterion is negative, $t = \pm 0.5042$. It means (as noted above in the Second Step) that the mean value over all 30 points $[x_{2i}; y_{2i}]$ in 2004 is closer to the origin $[0; 0]$ than in 2003 (in which it is the mean value for all points $[x_{1i}; y_{1i}]$). Regarding the economic development, years 2003 and 2004 were economically successful. The values of UNEM and INFL did not undergo a significant mutual change in those years; they did not move against each other, which should have happened if the Phillips postulate held.

Let us now apply the test of significance of change generally, i.e., to all data concerning UNEM and INFL in the selected 30 countries in the entire period 2003–2014. In that period, positive development prevailed in the years from 2003 to 2007, while the world financial crisis occurred in years 2008 and 2009, with the subsequent global economic recession. Years 2010 and 2011 can be viewed as a period of partial economic recovery, but the economies slowed down and the recession re-occurred in 2012 and 2013. These fundamental facts should be visibly reflected in the outcome of our test.

If our test is applied to the entire time series, that is, for all pairs from the years 2003 to 2014, we get Table 2. This Table shows all values of the test criterion t . It is symmetric with respect to its main diagonal (hence only a part of the Table is shown). The entries above the main diagonal (bold-framed)

show the test criterion values in consecutive years, that is, 2004 to 2003 (for which we explained above the illustration calculation of the value of $t = 0.5042$); other periods are analogous, i.e., 2005 to 2004, 2006 to 2005, 2007 to 2006, ... 2014 to 2013, as well as all pairwise combinations of years from 2003 to 2014 – cf. Table 2.

	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
2003		-0.5042	-1.6145	-3.3396	-4.0299	-0.5538	0.0769	0.9939	1.0486	1.8391	1.4315	1.0780
2004			-3.1960	-4.2686	-4.6243	-0.9644	-0.1058	1.3128	1.3601	1.5806	1.2169	0.3109
2005				-3.6259	-4.4094	0.1066	0.4390	1.9604	2.2456	2.2736	2.1860	0.9170
2006					-1.9210	1.2597	1.6953	2.8373	3.6583	3.5734	3.7430	2.5006
2007						3.7667	2.9261	4.9049	5.9766	5.3796	4.4551	2.6355
2008							1.4107	2.6755	1.4507	1.5046	1.0212	0.4595
2009								3.3042	2.2987	2.1518	1.6131	0.4492
2010									-0.2925	0.7848	0.6110	0.0478
2011										1.8039	0.8156	-0.7100
2012											0.0633	-1.5519
2013												-5.7846
2014												

Table 2. Test values for the significance of the ratio change

The values of the test criterion t (Table 2) are also shown in a chart in Figure 1. We can see in the chart that the values of t go down to negative values for the years after 2003, when the economies grew (accompanying the recovery). And the other way around, the values of t get above zero for the times in which the world economy cut back to recession (2008 to 2010, cf. the bold-framed entries in Table 2) A hint of prosperity in 2011 was sufficient to bring the test values back below zero. With return of economic difficulties to European economies in the years 2012 and 2013 values of t grow again. Year 2014 saw a fragile economic growth in Europe and the test value t gets below zero, as compared with 2013).

How can we interpret these observations from the viewpoint of the Phillips curve? Having a look at all values of UNEM and INFL, we can calculate that the variability of INFL values is more than three times lower than that of UNEM. The changes in the values of t shown in Table 2 are mainly caused by changes in UNEM; the influence of INFL is lower. Hence the prevailing negative values of t (that is, parallel approach to the origin) in the years of economic prosperity before 2008 indicate that the opposite tendencies in UNEM and INFL are not provable. Neither do the positive values of t in the years 2012 and 2013 prove such opposite tendencies in UNEM and INFL. A fragile recovery in 2014 puts the t statistic's value back to negative in comparison with 2013 (cf. Fig. 1).

Figure 1. *Test criterion values for all year pairs from 2003–2010*

A look at Table 2 provides some more interesting information: for example, the value of the test criterion comparing the UNEM and INFL values in 2009 with those of 2003 is $t = 0.0769$, i.e., nearly zero. The description of our test implies an interpretation: in 2009, when the economies were hit by a crisis, the mutual ratio of the UNEM and INFL indices in the total of the 30 considered countries was virtually identical with that of 2003. In 2009, in the time of a world-wide economic recession, the shape of the Phillips curve got back to that valid in 2003, in which year a certain economic recovery was beginning. In other words, the 2009 crisis put the ratio between UNEM and INFL by five to six years back. On the basis of the Table, a similar consideration is valid for the years 2010 and 2014 (here $t = 0.0478$, nearly zero again). The described relationships imply that the dependence of the inflation rate changes on the unemployment rate is insignificant. The evolution of the unemployment rate hence does not allow us to reliably predict evolution of price levels.

CONCLUSIONS

The Phillips curve, describing a relationship between the unemployment and inflation rates, has become subject to many disputes among economists. We can see that postulates several decades old fail to be valid under current economic conditions, or they will have to be modified and updated. This paper is one of the examples in which, using an original statistical method, we have been able to cast

doubts on the causal relationship between the unemployment and inflation rates in turbulent economic evolution (unusually quick alterations in economic growth and recession periods) on a set of 30 developed countries. This only emphasises the necessity to thoroughly discuss the relationships given by the Phillips curve. Let this be understood as an appeal: if the Phillips curve is applied in the area of economic policies, it should be done cautiously.

MANAGING SOCIAL MEDIA ADOPTION - AN EXPLORATORY INTERNATIONAL CASE STUDY OF HOTEL ORGANIZATIONS

Högberg, Karin

Department of Economics and Information Technology, University West, Trollhättan

ABSTRACT

The usage of social media is increasing rapidly in organizations. Technology has long been considered to be one of the most influential elements affecting the rules of competition. Therefore both technology management and strategy has become an important task for many business organizations. Seen from an organizational perspective, social media can not only be used to create interaction between members of the organization, employees, and customers but also to create a shared organizational intelligence. Hotel organizations is the focus of this study. The objective of the study is to provide insights to the managerial and organizational perspective of the adoption of social media in hotel organizations, exploring how the strategy of adopting and managing social media is performed within the hotel organizations. The results show that the hotels of the case study are in the beginning of their path of forming a strategy for social media adoption that also works in practice, not just in theory.

Keywords: *social media management, social media adoption, hotel organizations, knowledge management*

INTRODUCTION

The usage of social media is increasing rapidly in organizations (Kaplan and Haenlein, 2010, Weinberg et al 2013). Technology has long been considered to be one of the most influential elements affecting the rules of competition. Therefore both technology management and strategy has become an important task for many business organizations (Lefevbre, 1997). Since the usage of social media by consumers are increasing rapidly, organizations are also expected to be present in social media, generating and publish content, and not the least, interact with customers (Hanna et al 2011). Hotel organizations is not an exception. The hotel industry is a highly competitive industry with non-brand loyal customers who are price sensitive. (Sigala and Christou 2002, Sigala et al Leung et al 2010, 2012). Due to the development of Information Communication Technology (ICT) and social media, the hotel industry experience not only an increasing price transparency and globalization but also an increased demand on expectations of being present in social media channels (Sigala et al 2012, Munar 2012).

Seen from an organizational perspective, social media can not only be used to create interaction between members of the organization, employees, and customers but also to create a shared organizational intelligence (Bradley and McDonald 2011). Nevertheless, the challenge many organizations are facing is that even though they are aware of the need to be present and active in social media channels, they lack the knowledge and understanding of how to do so strategically and how to measure the results of their activities (Hanna et al 2011). Chui et al (2012) also argue that social media has changed many internal and external organizational processes, such as how organizations market themselves, what and how they sell but also service and management. Berthon et al. (2012) argue that social media has had three effects on the organizations: a change from desktop to the internet, a shift of power, from the organization to the customer and finally, the value production that now is focused and produced by customers. Social media therefore need to be managed just like any other technological adoption. Montalvo (2011, p. 91) defines social media management as a collaborative process using web 2.0 platforms and tools to accomplish requested organizational objectives.

The phenomena of social media is still in its early stages, and answers to how and why organizations should adopt and use social media and how the culture and management need to be transformed is not yet obvious (Weinberg et al 2013). Researchers also argue that to adopt media successfully, one must change the organization structure (Li and Bernoff 2009, Wren and Bedeian 2009). Kaplan and Haenlein (2010 p. 65) argue that organizations must know the elementary idea of social media and describes this as "It's all about participation, sharing, and collaboration, rather than straightforward advertising and selling".

Hotel organizations is the focus of this study. The objective of the study is to provide insights to the managerial and organizational perspective of the adoption of social media in hotel organizations, exploring how the strategy of adopting and managing social media is performed within the hotel organizations. Earlier studies shows that compared to other industries, hotel organisations are more restricted towards using social media in their marketing (Sigala et al 2012, Leung et al 2013). Although, being an industry that is sensitive to trends, has an exceptionally high competition and very flexible clients, marketing through social media has become an important part of hotels marketing strategy, which in turn effects the hotel organizational structure, strategy and management (Buhalis 2008, Nga and Basat 2011, Sigala et al 2012). The hotel industry has been using technology as a strategic tool since the 1950's, implementing digital booking systems, websites and nevertheless, wireless wi-fi in the hotel rooms (Werthner and Klein 1999). Buhalis and Law (2008) point out that the technological development and tourism industry has been going hand in hand. All these activities have been important in the hotel's competitiveness and survival (O'Connor, 1999, Siguaw et al., 2000,

Nyheim et al, 2004). Research shows that the hotel industry hopes that the adoption of new technological tools and software will reduce costs, increase productivity, and enhance competitiveness and improve the service to consumers (DiPietro and Wang, 2010, Singh and Munjal 2012).

EARLIER RESEARCH

Research on technology adoption in the hospitality industry has drawn a great amount of attention from researchers. Wang and Qualls (2007) however, argue that the knowledge of the area is fragmented and that we only have a limited understanding of how the technology adoption behavior in hotel organizations looks like. Wang and Qualls (2007) therefore calls for a need to “develop a greater theoretically informed framework that integrates the critical factors relevant to the hospitality industry” (Wang and Qualls 2007 p.561), arguing that many hotel organization has several weaknesses (e.g IT structure and limited technological expertise) that aggravates the adoption of new technologies. Other researchers also argue that both the research field of e-tourism and adoption of social media in hotel organizations is in its infancy and therefore rather thin (Buhalis and Law, 2008, Sigala et al, 2012, Lynn, Lipp, Akgün, and Cortez, Gohary 2011, Munar 2012, Leung et al 2013). Leung et al (2010) argue that even though social media is a growing phenomenon in the tourism and hospitality industry, there are little research on social media usage from the supplier’s perspective.

The knowledge of how the technology is used and managed in the hotel organizations remains unknown to researchers (Lee and Law 2011, Leung et al 2013). Lynn, Lipp, Akgün, and Cortez, Gohary 2011, Munar 2012, and Sigala et al 2012 call for more research in e-marketing and hotel organization and believe at a greater understanding of both the problems and opportunities that exist with e-marketing, and a greater understanding of how leadership affect strategic change as hotels and tourism organizations undergo in the adoption of social media. Reino et al (2014) point out that many of the studies of the hotel industry that focus on ICT and technology adoption are outdated and that they mainly are quantitative and do not offer a profound understanding of the issue. Most studies also follow a positivist method, such as Hashim et al 2006, Wang and Qualls (2007) Fuchs, Witting, & Höpken (2009), and Leung and Law (2012).

PURPOSE AND RESEARCH QUESTIONS

The focus of this study is the usage of social media within the context of the hotel organization and the aim is to create an understanding of the organizational and managerial strategy of the adoption of social media in hotel organization. In order to fulfill this aim the article seek to answer following research questions:

RQ1: How is the the strategy of social media adoption in hotel organizations managed and

performed?

RQ2: How can the managerial process of social media adoption be described?

METHODOLOGY

Since the objectives of the study are to create a greater understanding of the organizational and managerial strategy of the adoption of social media in hotel organization, a qualitative, explorative approach has been chosen. Case studies can be appropriate in studies that intend to answer questions like "why" and "how" and are descriptive in nature (Yin, 1998). It can also contribute with exposure of crucial patterns and behaviors (Smith & Albaum, 2005). Qualitative research method can help to create insights and identify key variables in the research questions (Malhotra & Dash, 2009). In total, 22 semi-structured interviews at 14 different hotels (belonging to the same hotel chain and brand) in 7 European countries (Denmark, Finland, France, Italy, Netherlands, Norway, and Sweden) has been carried out with marketing managers, sales managers and hotel managers (people responsible for social media activities) in the hotels. The interviews took place at the different hotels August – December 2014. Each interview lasted about an hour and were recorded and then transcribed (Bryman & Bell 2008). The themes for the interviews were focused on the usage of social media marketing in the hotel organization e.g. when and how the hotels started to use social media, what channels they use and how the social media strategy is developed. Follow-up questions were also asked, to follow up personal interpretations and knowledge from the different managers being interviewed. A qualitative analysis has been used.

CASE STUDY

The study is a part of a PhD- thesis and focus on hotel organizations within an international hotel chain, in this study called "International hotels". Altogether, 14 hotels, within the same hotel chain and brand, is the focus of this study. The different hotels are located in 7 European countries. The usage of social media is quite new at the hotels. The hotels were not allowed to use social media until 2013. The hotel chain provides the hotel with some marketing material, guidelines and education but beyond that, the hotels are responsible for what to publish in social media. The choice of hotel chain and brand is based on the fact that the hotel organizations are in the beginning of the process of using, learning and adoption social media marketing and e-relationship marketing. The fact that the hotel chain is a large, international hotel co-operation also makes it relevant to study since there are many, both managerial and organizational levels to take into consideration.

THEORETICAL FRAMEWORK

WEBB 2.0 AND SOCIAL MEDIA

The development of Information Technology (IT), Webb 2.0 and Information Communication Technology (ICT) has brought many new technologies and software, such as social media, which is largely used by companies. Web 2.0, consists of a platform comprised of its users that determines the content. The creators of social media is therefore the users themselves. This to be related to Web 1.0, where the internet was rather a storage area for information and venue for one-way communication where users had no opportunity for interaction. (O'Reilly 2001, Erkkola 2008). Web 2.0 reflects a blend of diverse types of ICT software tools, such as blogs, networks and Wikipedia's, usually referred to as social media (Xiang and Gretzel, 2010).

ICT AND SOCIAL MEDIA IN HOTEL MANAGEMENT

According to Buhalis and Law (2008), hotel managers have been fascinated with the gains that the ICT can contribute with in their industry. Most hotels (both independent and chain) are using websites to promote their hotel services. Successfully implementation of ICT in the hotel organization demands long term planning, training and knowledge through the entire hotel organization and top management commitment and knowledge (Buhalis 1998). Fuchs et al (2009) say that the usage of ICT should not just be looked upon as cost effective and as something that guarantee profitability. Instead, implementing ICT in the hotel organizations also include risks and costs. Yan et al (2006) discuss that it is crucial not to get a gap between the economic costs of using ICT and the actual value ICT actually contributes with. According to Vuori (2011) there is a fear of the unknown that can impact the organizational readiness to adopt social media and that even though many organizations may implement social media, there's still a lack of knowledge on how to use the new digital communication channels and tools. Denzizci Guillets study (2011) noted some companies lacked understanding and commitment of the usage of social media and explains this with the insecurity in what return on investment the implementation brings. Levy (2009), Culnan (2010) and Vuori (2011) argue that many companies don't have a clear understanding of what business value and benefits the usage of social media can contribute with and points out that the value of using social media does not come from the usage of the technology but depends on how the technologies are used. The development of social media and the increased usage of the digital communication channels has therefore changed how organizations function.

Both Litvin et al. (2008) and Salkhordeh (2009) argue that the usage of social media in organizations can be a valuable source of strategic information, especially the user generated content such as reviews and feedback.

STRATEGIC MANAGEMENT AND KNOWLEDGE MANAGEMENT

The increasing competition on the global hospitality market is a great task for strategic management (Rigby 2001). One of the main objectives for business managers is to create performance that is superior to competitors and a crucial part of achieving this is strategic formulation (Chathoth and Olsen, 2007). The development of competitive strategies is crucial in a high-competitive industry like the hotel industry. Enz (2008) and Olsen et al (2008), say that it is the hotel's combination of resources such as branding, IT, human resources etcetera, that creates a competitive advantage, rather than one single resource. Porter (1986) defines a competitive strategy as actions that gains the organizations competitive advantages in relation to its competitors.

Tourism and hospitality are both a highly knowledge-based industry but also information-intense industry, due to the innovation of ICT and social media (Nezakati et al 2014). Rigby (2001) argues that understanding the relationship between technology and globalization and the affect it has on a hotels ability to compete and create advantage is the core of strategic management today. Knowledge management (KM) has been, and is, a key to the implementation of social media, but also organizations ability of surviving in highly competitive environments (Ford and Mason 2013). Nevertheless, KM, is not a new phenomenon in the hotel industry, it has long been used as a competitive tool (Cooper, 2006, Shaw & Williams, 2009). Nezakati et al (2014) argue that researchers in the field of information system are interested in both the explicit knowledge and tacit knowledge. While the explicit knowledge is visible and easy to communicate, the tacit knowledge is hidden and therefore also difficult to spread. In management research, the concept of "knowledge management" has come to be described as one of the keys to the success of organizations and the term is also used in studies of the use of IT in organizations. Levinson's (2009) describes the "knowledge management" as a strategic process in which the organization tries to generate value from their intellectual assets. Sigala (2003) points out that information should not be mistaken for knowledge. She argues that knowledge is created first after the information is analysed and used in strategic activities. Both Sigala (2003) Aguila - Obra (2006) explain unsuccessful attempts to adapt new technology with lack of knowledge of the organization's leaders. The use of social media in business requires responsible employees who also are aware of what values and what message is relevant and desirable to spread. The personal accountability is of great importance for the organization, especially to ensure a good service but also increase the possibility of creating a relationship with the customer. The individual

employee's knowledge and personal qualities are highly relevant to the organization's ability to achieve its goals (Lindmark & Önnemark 2012). To avoid marginal results, hotel management need to implement social media information and UGC-content into the hotel's strategic decision-making process (Sigala 2003).

FINDINGS

STRATEGY AND ADOPTION

Hotel chain

Since all 14 hotels in the study are a part of the same hotel chain, they all started, or was expected, to start to use social media at the same time. The hotel-chain implemented a social media manager that create social media guidelines, marketing materials but also educate marketers at the hotels and also e-commerce manager across the world do help educate the hotels. The social media manager says that the hospitality is depending on a human approach in values, and to work with guest satisfaction. He also emphasizes the importance of not just looking at numbers but so see the person who want to experience the hotel. When it comes to the benefits of working with social media he says:

“It's the quality, it's really important of course, the content has to be of good quality. The content is the most important and we need a lot. We need to engage in a special way with our community.”

He predicts that in the near future, 50 percent of the hotel communication will be held in social media, to be compared to today when its 20-80 but that it also depends on what geographical region you are in. The biggest difference in social media marketing and traditional marketing is the possibility of communication, not just one way, and the consumer's ability to share, like and comment. He also views he guests and social media followers as co-producers of the hotel brand and that user generated contend like travel bloggers can and should be used and shared as hotel marketing material in social media.

The e-commerce manager thinks that social media is all about talking to customers. She says that people who work at the hotels are not marketers and it's about getting the right message to the right person at the right time and that's something normal, but not yet for the hotels because they are focusing on their operational business to that's the main lesson she tries to teach the hotels. She thinks that the hotels should be a part of the guest's decision path and be aware of that hotel quests not very

often start out with deciding what hotel to stay at but know what destination they want to visit and look for hotels in the area.

“There is coordination and training for the hotels because the people that are working at the hotels are not specialists in e-commerce so we try to train them in basic knowledge about the field but also knowledge about the company strategy. So I try to work with them, I set up meetings and help them to understand things that might be interesting for our customers. We see a lot of pictures of the hotel managers that are standing like this [poses like she is in front of the camera] and that is not interesting for the customers.” (E-commerce manager)

Individual hotels

The managers at the individual hotel often look at social media as a marketing tool, rather than a strategic instrument. They are all aware of the demand from the head office to use social media in the hotel organization but have different ways of handling that demand. Only one of the hotels has a person who is especially responsible for the social media adoption. At the rest of the hotels, the social media activity is added to the marketing or sales manager's duties. As a result of this, the managers describe that social media is sometimes omitted due to lack of time. Many of the managers describes a frustration when it comes to marketing material produced by the hotel chain. The material is described as made for traditional marketing in printed media, and they feel that the material (that they are requested to post in their social media channels) “destroy” the content e.g. on their Facebook-pages and are not very fond of publishing it.

“one thing I really don't like is when they [hotel chain] send out post that we have to copy and paste it and post it and then every single hotel has that and its really...its really annoying! I don't like that at all! It's not personal at all, they should just like suggest like ok this is the thing with the brand, maybe you should make a post of it but have it be something about you and your hotel rather than just the whole chain” (Sales manager 10)

Some of the sale marketers describes the aim of using social media is to get as many likes as possible so that so many as possible can see what the hotel is doing and who they are. The managers express that the kind of marketing, when the customers are spreading information about the hotel, is the best kind of marketing the hotel can get and that is what will create top of mind. One of the marketing manager describes the main advantages of using social media marketing is that the hotel can measure ranking and how many people that follow and like their posts.

RETURN ON INVESTMENT

Hotel chain

The e-commerce manager explains the hotels hesitation about using social media with the fact that hotels tend to be focused on the hotel business and giving the customer a good experience and are therefore not focused on marketing. She is aware of the importance of measuring results in the hotel industry but says that social media can't be measured like an ordinary campaign because it's different. Instead, the key is to find what the customers are interested in and not to be afraid to talk to the customers.

"The storytelling is important, the idea is to have the customer to engage, hotels often ask why they have to engage in social media because it takes time and sometime it cost money and it doesn't bring back money, the ROI for social media is pretty low. But for us the great advantage in engaging in social media is that we can interact with our customers, we can talk to them and create an awareness and probably they want to keep the relationship. (...) We know that for us there are no ROI in this, but it's for our customer and a way for us to be with them throughout their whole journey." (E-commerce manager)

Individual hotels

All of the managers at the hotels describe the problems of not being able of measuring the return on investment and what they really gain, or sell, by using social media. They describe the hotel industry as an industry that rely on measurements and numbers. This causes a conflict based on that the management described as "upstairs", demanding quantitative and measureable data and results on social media activities. The managers at the individual hotels experience that they cannot deliver that.

"everything should be measured...we need to know return on investment on everything we do. You always ask what's the return on investment, that's the most important thing. And from Facebook, it's quite hard to measure. Do the guests book after seen our Facebook page or? We don't know. " (sales manager 11)

MANAGING KNOWLEDGE

Hotel chain

The hotel chain provides guidelines and education to the individual hotels. One of the e-commerce manager's tasks is to train managers at the individual hotels. She says that the employees working at the hotels are not specialists at social media and that she therefore need to provide them with basic knowledge about the technology but also knowledge about the company strategy. She also emphasize

the importance of helping managers to understand what material that might be interesting for the hotel customers. She suggest that the hotels should have an insider view, to tell the guests about the hotel, their story and about people's life at the hotel. The storytelling is important such as customer's online journey, from the decision to travel, to the choice of hotel. She says that the presence in social media is about following the customer on her or his journey and proposing the hotel at the right moment. She describes the biggest mistake the marketers can do in social media as:

"To be standardized. In the future social media will be all about having a fresh content all the time, the storytelling, and giving the right message to the right person at the right moment. So not use the same text in all social media channels but to express different channel, use different words and address it to a specific target" (E-commerce manager)

Individual hotels

Although the hotel chain offers training from the social media manager and e-commerce manager, there are few manager at the hotels that actually utilize that opportunity. At many of the hotels it is the employees that are interested in using social media in their private lives that are a part of the "social media team", e.g. by taking pictures that are published. Some of the hotels look outside of the hotel chain for knowledge, hiring PR-firms that both educate the hotel staff and help to produce marketing material meant to be used in social media. The term "learning by doing" is often used to describe how the hotels have adopted social media. All of the hotels express the need for quality control before any pictures or posts are uploaded in social media channels. When it comes to taking part of the material posted by customers (UGC), the hotels are divided into two groups, the ones that actively scan social media, trying to embrace trends, customer satisfaction and interact with customer. This group of hotels often put a lot of time and effort in social media activities. The other group, expresses that they are not interested in the interaction with customers, and that social media is used foremost to give information to customers. (being a part of the customer journey?)

"well , we 're not using social media just because we think it 's fun , I thought of the old IBM advertisement , "why should we be on the internet ?" I don't know but we are there... We're on Facebook..but do we make any money by being there? No, but it's a window, and it's really difficult to measure." (Sales manager 6)

Customer reviews and UGC are looked upon as an extension of customer reviews that has always been a part of the hotel industry. The big difference described by the managers is that social media makes it transparent, putting a lot of pressure to answer the review, and answer fast. Many of the managers express that they have lost control over both pricing and the ranking system of hotels.

DISCUSSION

THE STRATEGY OF ADOPTING SOCIAL MEDIA

The strategy of adopting social media in the hotels must be looked upon from two perspectives, the hotel chains and the individual hotels. The hotel chain has a clear strategy and focus on that the individual hotels should adopt social media and are doing so by creating guidelines, marketing material and offering education. Although, there seems to be a gap, or conflict, in how the hotel chain interprets the intention of using social media compared to the individual hotels. The conflict reveals itself in two ways, first, how the individual hotels describe the advantages of using social media. They often look at it as a marketing tool rather than a strategic instrument but foremost, social media is looked upon something that is time consuming. Second, the individual hotels do not always see the advantages of actively searching for interaction with customers, something that is highly valued from the hotel chain. This type of interaction is also described as a strategic tool by researchers like Litvin et al. (2008) and Salkhordeh (2009).

MANAGEMENT

The managerial process is also divided into two categories, the hotel chain management communication towards the individual hotels, and the management at the individual hotels. The hotel chain is very clear about that the hotels should adopt social media but according to the given answers from respondents of the present study, there seems to be a lack of understanding and knowledge of why the hotels should spend time and money on something that cannot be measured. The insecurity and lack of ROI is apparently causing the hotels some problems (Yan et al, 2006). The interviews reveal a discrepancy on the hotel managers' knowledge on technology and social media. Many of the managers build their decision-making about how to use social media on personal interpretation of social media rather than on actual fact (Levy, 2009, Culnan, 2010 and Vuori, 2011). One could also argue that from this perspective, the managers at the individual hotels are important organizational cultural bearers, that by how they act and talk about social media indicates how it is or should be valued in the organization (Schein 2010). Lefebvre, Mason, and Lefebvre (1997) argue that management plays a central role in the process of adopting and learning new technology, and can affects the whole organizations attitude towards the technology. Several of the managers at the individual hotels do not identify social media as a strategic tool and therefore do not discuss it in those terms. Many of the managers do not express that they can identify the benefits of social media, it seems like some of them are quite critical against the idea that the hotel chain has embrace social media to such a big extent, after not allowing the hotels to use it for such a long time.

KNOWLEDGE

When it comes to knowledge, it is clear that the hotels do not fully embrace the opportunity of learning how to use social media from the hotel chain. The hotel organization therefore does not fully succeed in transferring knowledge from the social media manager and the e-commerce manager throughout the individual hotels. There is also a contradiction in the marketing material sent out from the hotel chain and the material that the e-commerce managers suggest that the individual hotels should use, describing that it should not be standardized, but adjusted to different social media channels. Something that the hotel chain itself according to the hotel manager's does not succeed with, sending out marketing material that is suitable for traditional, one way-communication, rather than two-way communication in social media. Levinson's (2009) describes the "knowledge management" as a strategic process in which the organization tries to generate value from their intellectual assets, but it seems like both the organizational structure, and the organizational culture sometimes creates borders to succeeding fully with this. One explanation could be that the structure of social media does not fully match the structure of organization and their need for quality control and management. The respondents in the individual hotels talk about "learning by doing", something that compared to Nezakati et al's (2014) discussion about tacit knowledge, that is hidden, and therefore difficult to spread to other employees.

CONCLUSION

The empirical material indicates that the hotels are in the beginning of their path of forming a strategy for social media adoption that also works in practice, not just in theory. There are big differences in how social media are performed in the individual hotels but also when it comes to the interpretation of how and why social media should be used, described by the hotel chain managers and the managers at the individual hotels. A lot of different elements affect how the hotel organizations understand and use social media. The discussion above is deliberately just scratching the surface and is a first attempt to point out what elements that need to be looked deeper into in my following PhD-thesis. What one could argue is that the nature of hotel organizations can be described as a contradiction to the nature of social media where things happen fast, in the moment, by people interested in social media. According to the empirical findings, the hotels and their managers are still struggling to find a way to communicate what social media is and why it is used and there are still some contradictions that need to be solved. When it comes to brand marketing, the hotel chain decides in detail what the hotels should post in social media, whereas the hotels are producing their own marketing material to promote their individual hotel. Future studies could focus on how to create strategies for communicating knowledge and understanding of social media, but also on the changes

in power, transparency and the difference of using social media as a private person, translating it into an organizational usage. Finally, research on how to make qualitative measurement on the value created and returned to the organization would be useful.

DETERMINANTS OF DESTINATION COMPETITIVENESS AND SUSTAINABILITY: A FACTOR AND CLUSTER ANALYSIS

Iaffaldano Nicolaia¹; Recchia Pasquale²

¹Ionian Department in law, economy and environment, University of Bari Aldo Moro, Italy

²Department of Economics and Mathematical Methods, University of Bari Aldo Moro, Italy

ABSTRACT

Objectives: the research aims to verify if and how the widespread cultural heritage in Taranto, city of “Magna Grecia”, may help to achieve social and economic positive externalities, so substantial benefits for inner stakeholders to the destination, due to the culture, aptitude to relation, cognitive abilities, knowledge, traditions ingrained in a specific cultural area.

Methodology: the statistical methodology we used aimed first at making a summary, by means of factor analysis, of an amount of information which was in the questionnaire items. The extracted factors were later used as key variables in a cluster analysis, in order to divide the subjects into different groups, where each one of them represents a different perception profile about the examined phenomenon. The clusters were later crossed with the information concerning the residence area in order to verify the hypothesis of a different perception of the phenomenon between the different areas.

Findings: the research tried to define the role of intangible assets in the development of the Ionian cultural tourist destination, as it is perceived by its residents.

Research limits: limitations are due to the restricted data used in this phase of the research, which takes into account only the views of inner stakeholders, lacking the perspective of external stakeholders, such as tourists.

Practical implications: this paper offers policy suggestions to public decision makers and to private subjects for the integrated management of local resources.

Originality of the study: the research tries to define an organic, aware and shared design of territory development which, by leveraging on social capital, can promote and drive the development itself.

Keywords: *destination management, cultural heritage, destination competitiveness, intangible assets, sustainable tourism, quality of life, cluster analysis, factor analysis*

INTRODUCTION

What we want to show with our research is an analysis of the widespread cultural heritage of the city of Taranto, the systemic set of widespread cultural heritage in the city and in the surrounding area, and to see it as a possible cultural tourist destination.

If we read all the works dealing with Destination Management, it can be said that a competitive destination can be obtained thanks to the use of a specific system of tangible assets, for instance an attractive tangible cultural heritage and what we usually consider intangible, that is a set of organizational and management skills and abilities (Aaker, 1989; Brondoni et al., 2003) permitting both first the design and then the allocation of an integrated offer that can understand and meet the different exigencies of its own potential reference market. On this account we can state that the destination competitiveness is the interaction result of different factors that have to be managed together. This infers that a competitive destination can be gained through the activation of a tangible and intangible assets system developed in a resource-based view (Grant, 1991, 2005) and with reference to the numerous theoretical works that helped to codify the role of the enterprise assets as an analysis unit in the creation dynamics of the competitive advantage.

In order to have a good theoretical framework, we analysed national and international management literature that proposed different models which identify and analyse the destination competitiveness drivers and the role that can be played by a destination's intangible assets when they support its competitive processes (Crouch, 2011; Ritchie and Crouch, 2000, 2005; Ritchie et al., 2001; Kozak and Rimmington, 1999; Enright and Newton, 2004; Dwyer et al., 2004; Franch and Martini, 2013; Iazzi et al., 2012; Mazanec et al., 2007). If we read the macro categories of Ritchie and Crouch's model (2000) from a tangible/intangible assets viewpoint, we could deduce that a conspicuous and particularly remarkable part of the destination competitiveness determinants can be regarded as intangible assets. We must also remember that according to the above mentioned Ritchie and Crouch's model the sustainability of a destination is a requirement to obtain the competitiveness of that destination. On this basis it firmly acknowledges the intrinsic tie between the destination competitiveness and sustainability. Therefore, scholars state that the most competitive destination is the one that improves the quality of life of its residents to the largest extent.

For our research we decided to analyse, as far as attractiveness and competitiveness are concerned, the contribution of a cultural tourist destination's intangible assets, considering the inner stakeholders' perspective and above all the residents' one. Basically, we want to verify if and how the widespread cultural heritage of the city of Taranto may help to achieve social and economic positive externalities, and consequently substantial benefits for stakeholders involved in the local community as the residents, public institutions, enterprises, due to the culture, aptitude to relation, cognitive abilities,

knowledge, traditions, and to the customs ingrained in a specific cultural area. The above mentioned reasons lead us to wonder whether residents benefit from the culture of the area, the specific competences, and from the cultural tourist destination's relational abilities through which the quality of life needs to be improved (Martini, 2010, p. 60), and to check which specific competences and relational abilities they have shown to have. As far as the development of the Ionian cultural tourist destination is concerned, we tried to define the role of intangible assets as it is perceived by its residents – taking into account that, at the present time, the city of Taranto still hasn't obtained the "destination" status, except for the slender inner regional flow of tourists, even though, touristically speaking, it owns a high potential to develop. To obtain this kind of information we administered an ad hoc questionnaire, thus getting a sample survey. It is remarkable the need of a survey addressed to the resident community, because, as they have a wider view of the environmental context – both for their acquired knowledge and for their own relational abilities (as shown in the questionnaire) – they can play the role of promoters of a territory development (Golinelli, 2002, p.178). Furthermore our purpose is to highlight how cultural tourism can be an opportunity for the city and its sustainable development, thus becoming a proposal which is somewhat shared by the resident community and that should be put forward to policy makers by a logic of "participative strategic planning" (Napolitano, 2000, p.283; Baggio et al., 2010; Bramwell and Lane, 2011).

METHODOLOGY

To get all the data we needed we carried out a desk analysis about the theoretical contributions to the study of the development strategies of the local interest cultural heritage in view of the sustainable development (Montella 2012; Golinelli, 2008) and to the studies about Destination Management (Ritchie and Crouch, 2005; Pechlaner and Weiermair, 2000; Franch, 2010; Pencarelli, 2009) and about Resource-based theory (Barney, 1991; Grant, 1991, 2005; Lipparini and Grant, 2007; Pellicelli, 2005). We analysed the national and international works about the destination competitiveness and the role that intangible assets can have in supporting its competitive processes. We also shared the qualification proposal of a tourist destination's intangible assets that were observed in the culture of the territory, in the specific competences, in the relational abilities and in the destination brand equity (Iazzi et al., 2012). By means of a quality-quantity methodology, an on-the-spot analysis was carried out through a questionnaire. The five following sections belong to the tool used for the research: the first one deals with the social-demographic characteristics of the interviewed residents sample (*section A*); the other sections, composed of 33 items, investigate the interviewees' opinions on the territory culture (*section B*), the specific competences (*section C*), the relational abilities (*section D*) and the cultural tourist destination brand (*section E*). As for the questions where the interviewees' assessment was required,

we used a five-point Likert-type scale, from 1 = nothing at all to 5 = very much. We directly interviewed and administered the questionnaire to a sample of 30 residents in each of the 10 neighbourhoods composing the city of Taranto (Borgo; Città vecchia; Italia Montegranaro; Lido Azzurro; Paolo VI; Salinella; Solito Corvisea; Tamburi; Tre Carrare Battisti; San Vito Lama Talsano). Consequently, the interviewees were 300 residents out of a population of about 200.000 inhabitants. The 10 neighbourhoods were later grouped into 4 areas, considering how close the residents of the neighbourhoods were to the different elements characterizing the city, which identifies the area 1, as the oldest and richest in cultural heritage: area 1 (Città vecchia, Borgo); area 2 (Italia Montegranaro, Tre Carrare Battisti, San Vito Lama Talsano); area 3 (Salinella, Solito Corvisea); area 4 (Tamburi, Lido Azzurro, Paolo VI).

The first purpose of the statistical methodology we used was to make a summary, by means of factor analysis, of the huge amount of information which was in the items administered to the interviewees (Bartholomew et al., 2008). The extracted factors were later used as key variables in a hierarchical cluster analysis (Punj and Stewart, 1983), in order to divide the subjects into different groups, where each one of them represents a different perception profile about the examined phenomenon. The clusters were later crossed with the information concerning the residence area in order to verify the hypothesis of a different perception of the phenomenon between the different areas of the city.

STATISTICAL RESULTS BY MEANS OF A FACTOR AND CLUSTER ANALYSIS

By using the Principal Components Analysis (PCA) as factor extraction method, we carried out a Factor Analysis (FA) to summarize the information taken from 33 items of the questionnaire (Bartholomew et al., 2008). We realized that 5 of the analyzed items are not very correlated with the overall system of relations as they have very low communalities and for this reason they have been removed from the analysis. However a Kaiser-Meyer-Olkin (KMO) index equal to 0.915 confirms the usefulness of an FA.

To summarize most of the information taken from the 28 selected items the PCA has suggested using 5 components. The components we used have an at least unitary explained variance (this variance is calculated by means of the eigenvalue of the single component) and on the whole the result has been that 5 components explain almost the 76% of the cumulative variance. In Figure 1 we can see how every component explains decreasing portions of the cumulative variance and therefore the first five of them have been considered as good enough to explain the different aspects of the analyzed complex phenomenon.

Component	Explained variance	Explained variance (%)	Cumulative explained variance (%)	Component	Explained variance	Explained variance (%)	Cumulative explained variance (%)
1	12.63	45.11	45.11	15	0.26	0.93	93.45
2	4.32	15.43	60.54	16	0.25	0.91	94.37
3	1.61	5.74	66.28	17	0.21	0.76	95.13
4	1.51	5.4	71.68	18	0.20	0.71	95.83
5	1.2	4.28	75.96	19	0.18	0.63	96.46
6	0.92	3.28	79.24	20	0.16	0.57	97.03
7	0.73	2.61	81.86	21	0.16	0.56	97.59
8	0.58	2.07	83.92	22	0.14	0.51	98.10
9	0.51	1.83	85.75	23	0.13	0.47	98.57
10	0.47	1.69	87.45	24	0.12	0.42	98.99
11	0.41	1.47	88.91	25	0.10	0.35	99.34
12	0.40	1.44	90.36	26	0.09	0.32	99.66
13	0.33	1.17	91.53	27	0.06	0.22	99.88
14	0.28	1	92.52	28	0.03	0.12	100

Table 1: *Explained variance by the first five components extracted*Figure 1: *Scree plot of eigenvalues*

By fixing the parameter K at 2.7, we used a PROMAX oblique rotation aimed at identifying and naming the different factors to use as perception indicators of the phenomenon (Hendrickson and White, 1964). Thanks to this rotation every factor is very correlated with some items, the ones which identify it, and not very correlated with the others. For this reason, every factor is like a summary of the items it is correlated with. In Table 2 we can see the components matrix that indicates the correlation between each item and the 5 factors considered after carrying out the rotation. The communality shows the variance proportion of each item reproduced by the five factors.

* The item B.6.2 is almost equally correlated with factors 1 and 5, but it has been included in the first one because it is more similar to the other items correlated with it

Table 2: Components matrix after PROMAX rotation (in bold the best correlation for each item)

The examined items carry a remarkable weight, so the five factors underline the basic dimensions thanks to which we can classify the interviewees' assessments. Each factor is an indicator of a single dimension of the considered complex phenomenon. We can summarize the identified five factors as follows.

Factor 1 , called "importance of the territory culture and relational abilities", is correlated with 9 items and it generally proves how important are, in the interviewees' opinion, the cultural aspects and the relational abilities of the territory for the city growth.
Factor 2 , called "perception of the territory culture, of the relational abilities and of the competences", is correlated with 6 of the items and demonstrates how the territory culture, relational abilities and the competences in local human resources are actually perceived by residents.
Factor 3 , called "perception of the environmental protection", is correlated with 4 items and shows what the resident interviewees think about the presence of care with environmental matters.
Factor 4 , called "perception of the cultural heritage", is correlated with 6 items and shows the way in which the interviewees consider the residents' sensibility regarding the city cultural and artistic heritage.
Factor 5 , called "perception of the territory economy", is correlated with 3 items and it generally demonstrates the residents' perception about the care found on the territory regarding the economic aspects of the city as a tourist destination.

Table 3: five factor analysis

As far as every single factor and interviewee is concerned, we have calculated a factorial score that provides the measure of a dimension of the considered complex phenomenon. Each factorial score is distributed as a standardized normal. Positive values demonstrate the interviewee's positive assessment about the dimension associated with the factor, and vice versa as regards the negative values. Values close to zero can be considered average.

On the basis of the five extracted values a cluster analysis has been done in order to divide the interviewees into clusters of similar individuals as far as the perception of the phenomenon is concerned, thus identifying different ways of perception of the city of Taranto. To identify the clusters we have used a hierarchical algorithm, based on Ward's agglomerative method, and on the squared

Euclidean distance as dissimilarity measure between the interviewees (Bartholomew et al., 2008). The algorithm led to the identification of three clusters that can be fundamentally considered as representative of three different resident profiles based on the perception of the different examined aspects of the territory intangible assets. In table 4 there are both the number of units of each cluster and the mean of factors for each of the five considered factors. The negative values of the cluster mean can be interpreted as a low opinion about the corresponding dimension, while vice versa the positive values show a high opinion of that dimension for the interviewees.

The first cluster (*Profile 1*) is composed of 113 individuals who, on average, attach little importance to the aspects linked to Factor 1, low perception of the aspects summarized by Factor 2, and mean values for the other three factors. The second cluster (*Profile 2*) is composed of 72 individuals who attach great importance to the factors summarized in Factor 1 but perceive in a negative way all the expressive aspects of the phenomenon. We can say that to these individuals the examined aspects are important, but that they are little satisfied with the present situation. The third cluster (*Profile 3*) is composed of 115 individuals who attach an almost average importance to the aspects examined in Factor 1, but perceive in a very positive way all the others expressive dimensions of the examined phenomenon.

In table 5 the information concerning the residence area has been crossed with the membership of the three profiles identified as far as the perception of the phenomenon is concerned. The association has been remarkable in the Chi-Squared test ($p < 0.001$), as it has shown an influence of the geographical factor. Actually, the area 1 is clearly characterized by individuals of the profile 3 (68.3%), i.e. by residents who perceive the phenomenon better but with a good percentage also by individual of the profile 2 (21.7%). Areas 2 and 3 can be considered as mixed ones, without any specific trend, and are characterized by individuals with heterogeneous opinions. On the other hand, area 4 is characterized by many individuals of profile 1 (46.7%), those who are less attentive to the matters concerning the city according to the examined distinctive aspects, and anyway by a good percentage of individuals belonging to profile 2 (37.8%) who perceive in a bad way the examined aspects even if they consider them as important ones.

Cluster (Profile)	1	2	3
n	113	72	115
Mean	Factor 1	-0.6490	1.0796
	Factor 2	-0.6917	-0.5856
	Factor 3	0.1784	-1.1259
	Factor 4	0.0904	-1.0941
	Factor 5	-0.0067	-0.9286

Table 4: Number of units and mean of factor for the clusters (%)

		Profile		
		1	2	3
Area	area 1	10.0%	21.7%	68.3%
	area 2	43.3%	10.0%	46.7%
	area 3	43.3%	26.7%	30.0%
	area 4	46.7%	37.8%	15.5%
Total		37.7%	24.0%	38.3%

Table 5: *Cross between area and cluster membership*

On this account, all the features correlated with the territory culture and the examined relational abilities, with distinctive differences between areas, show a higher mean value in area 1, thus meaning that in it the residents have a better perception of Taranto as a cultural tourist destination, thanks to the presence of a predominant territory culture in the residents of the two oldest neighbourhoods of the city and also because they are very keen on collaboration. Moreover, as they have the cultural heritage close to them, they show a strong sense of belonging. For this reason, the perception of the residents in Città vecchia and Borgo is remarkably different from the perception of the residents in Paolo VI or Tamburi, the notorious neighbourhoods of the industrial outskirts, where what prevails is not the sight of the cultural heritage but the presence of the Ilva iron and steel industry and the environmental pollution it causes.

CONCLUSIONS

The “tourist destination” product is a complex offering system characterized by the presence, in a specific territory, of tourist resources and services. For this reason, we think it is absolutely necessary to activate managerial routes aimed at systematizing and exploiting the existing resources, thus creating uniqueness and distinctiveness, therefore differentiation, compared to the competing destinations. All that mainly aims at getting a competitive advantage in a sector characterized by more and more increasing complexity levels, because of the changes occurred in the ways and forms of the tourist consumption. Moreover, notice that tourist destinations have two competitiveness levels: the former concerns the competitive confrontation between the existing destinations on a global scale; the latter develops itself inside the specific destination and concerns above all the enterprises working in it (Pencarelli et al., 2013; Franch, 2002; Buhalis and Cooper, 1998).

According to what happens in the enterprise competitiveness and according to the resource-based view, the growth and development of a tourist destination is now remarkably caused by the tangible and intangible assets that characterize it, as well as by the local actors’ abilities to exploit them and to

improve development paths to follow even through the activation of relational mechanisms able to improve the quality and the offer differentiation within a systemic logic. In this case the territory is seen as a social institution having the same characteristics as an enterprise, thus interpreting the territory organization according to the “viable systems approach” theory (Golinelli, 2002; Barile, 2011).

In our study, we thought it was useful analyzing the role of the intangible assets in the development of the Ionian cultural tourist destination, as it is perceived by the resident community. Therefore, we need to study the intangible asset concept in depth, with reference to destinations. Such assets differentiate the territory because they are distinctive elements, thus allowing the creation of a competitive advantage that is lasting and defensible. That happens because of the difficulty to exactly identify and repeat the path which allowed their origin. As a matter of fact, from the temporal and economic point of view, the *soft* components of a territory are not only difficult to create but, because of their specificity, they are also seldom used in contexts different from the one in which they were created. Consequently, they are difficult to be imitated and reproduced by the competing territories (Itami and Roehl, 1987; Vicari, 1991; Rullani, 1999). If we take into account the enterprise culture concept, the first intangible asset we deal with is the “territory culture”. When we talk about the territory culture of the cultural tourist destination, we mean the traditions and knowledge heritage characterizing the history and culture in a specific area and influencing the behaviours and actions of its residents, local institutions, schools, universities and enterprises, that is the local actors who are committed to a destination. As the questionnaire shows, the presence of such an asset can be identified by observing the resident community’s sensibility degree towards the knowledge of the cultural and identity values of the local historical-artistic heritage. We can identify another asset in the “specific competences” of the destination because they correspond to the local community stakeholders’ abilities (inner stakeholders) – and therefore the territory human resources’ ones – to develop and use the specific resources, which are intrinsic to the destination, in a sustainable way, thus preserving their integrity in order to improve above all the quality of life, protect the cultural heritage for the future generations, preserve and exploit landscape and environment, and achieve a lasting competitive advantage. What we call “relational abilities” of the cultural tourist destination are the specific attitudes enabling the activation and governance of relational mechanism between the single actors of the destinations, but also with actors living outside the reference territory. As for the local area, all that requires a collaborative logic between the actors involved in the offer and stresses the rather remarkable role of the public institution as it influences the coordination of the local actors. The need of offer coordination in the destination is in direct ratio to the variety of demand. We can measure such an asset, as shown by the questionnaire items, by examining the presence of tourist-

cultural routes, which have different actors involved, aimed at getting a shared growth of the territory use – through actions whose purpose is to create an integrated offer – and at meeting tourists' personal requirements which drive their choices. There is the general agreement that the activation of relationships permits an increase of every actor's competences – such as shareholders, stakeholders, residents, clients or government bodies – through the creation and diffusion of the knowledge concerning the territory processes, services and products with a dynamic view of the scene and of the competitive challenges. The most important requirement to get all that is contributing to the growth of the context social capital, as stated by Costabile and Lanza (2000), where the above-mentioned capital corresponds to the cluster of relationships that arises between the different individuals and is able to increase the conditions of the same membership context. We can find many works about the multidimensional aspect of the territory structure in which territory is qualified as a system of tangible and intangible assets and of numerous forces (individuals, organizations) that interact with one another. We can therefore state that the territory is not only a cluster of infrastructures, services and natural resources, but it is above all the cluster of abilities, relationships and knowledge which depict a relational space unique and not easy to imitate (Costabile and Lanza, pp.65-66).

In our study public decision makers and private subjects of the city can find policy suggestions concerning the planning and development of a management model adequate for the systemic perspective and applied in a cultural tourist destination context like Taranto. By using its culture and its knowledge deeply ingrained in the local territory together with its relational abilities, Taranto should try to increase, from a systemic point of view, the intangible assets of its peripheral neighbourhoods, where they do not seem so developed with the final purpose of getting a balanced and sustainable development of the city.

MUSEUM ENGAGES COMMUNITY: SOME EVIDENCE FROM ITALY

Imperiale, Francesca¹; Terlizzi, Valentina²

¹Dept. Management and Economics, University of Salento, Lecce, Italy

²Dept. ISUFI, University of Salento, Lecce, Italy

ABSTRACT

In the XXI century museums are assuming new roles and developing new ways of working to demonstrate their social purpose and impact. The relationship between museums and communities is the cornerstone of the topic: becoming cultural mediators, museums allow communities to be engaged in the process of representing the past, understanding the present and promoting the future of the cultural heritage.

This paper aims to understand the contemporary thought and practice about this change, exploring how the relationship between museums and their communities is taking place in the Italian context and what are the potential implications on operational and governance structure and performance.

To this purpose, it analyzes a selection of literature and shows the results of a two-step survey on a sample of Italian municipal museums.

The community engagement is conceived as a process through which museums may cooperate with and for citizens or groups of people who share places or interests, to face specific issues in order to pursue important benefits both for communities and institutions.

As for the results, the use of specific approaches and tools for different degrees of community participation is tangible. The research identifies three archetypes: community as customers of services; community as providers of knowledge; community as entrepreneurs.

Even though in most cases the results show that Italian museums engage communities with new communication tools, they open new scenarios about the relationship between the museum governance and its performance.

Keywords: *Museum, community engagement, public governance*

INTRODUCTION

The current relation between museums and communities derives from a wider evaluation process of culture as strategic asset of democratic awareness for people and society. Nowadays, cultural and political institutions need to prepare the ground for people education improving their capacity to access cultural life in a freer and more responsible way (Dewey 1992; Matarasso 2004).

Since the Fifties, new models of policy to develop people's access to museums were inspired by the concept of democratization of culture aiming to guarantee a wider and equal cultural access. Its translation in real actions helped to break down social and cultural barriers.

During the Seventies, the new concept of cultural democracy was conceived in terms of wider participation and cultural creation, using a bottom-up approach. In other words, it had the aim of creating cultural inclusion.

In the definition of new missions and politics of cultural institutions, cultural policies had important consequences. In particular, the post-museum acquired a new social role to educate «individuals with strong personal identities, strong self-esteem, confidence, and the ability to evaluate and make judgements about their own best interests» (Hooper - Greenhill 2007, 200).

As a consequence, in the XXI century museums have new roles and they develop new ways of working to demonstrate their social purpose and impact, becoming institutions dedicated to *lifelong learning* approach (Hein 1998) at individual, community and societal levels (Sandell 2003, 191).

Museums as cultural mediators engage the community in the process of representing the past, understanding the present and promoting the future of the cultural heritage. Their role is not only to create cultural tools but also to involve community as a co-protagonist of the museum life (Donato, Visser Travagli 2010).

This paper aims to understand the contemporary thought and practice in addressing this change, by exploring how the relationship between museums and their communities is taking place in the Italian context and what are the potential main implications on operational and governance structure and performance.

MUSEUM ENGAGES COMMUNITY

Considering the international debate on this issue, it is possible to identify different approaches and perspectives to define the concepts of community and heritage, and the links of mutual influence between cultural heritage and community, and also the role of the museum (Waterton and Watson,

2011; Crooke, 2007). On the one hand, the issue is complex in its theoretical definition, on the other it is a soft target for government policies that in the global context are exploiting museum institutions and their programs to achieve various policy goals (social inclusion, cultural diversity and multiculturalism, civic engagement and social capital, etc.), and to add further justifications for public intervention in this area (Gray, 2008).

The paper does not deal with epistemological and political issues, it conceives community engagement as a strategy to improve museum performance. More specifically, community engagement is assumed as the process through which museums may cooperate with and for citizens or groups of people sharing, for instance, places or interests, to face specific issues in order to pursue important benefits for communities and themselves (Bowen et al., 2010).

It could embrace a variety of approaches and practices whereby museums involve communities in considering and expressing their opinions about their needs (Crooke 2007; Waterton and Watson, 2011). Museums could encourage people to have a voice in setting cultural offer, sharing decisions on specific projects or policies.

Simon's research (2010) has proposed the following four participatory models considering people involvement in museum projects and activities:

- a. *Contributory projects* solicit visitors to provide «limited and specified objects, actions, or ideas to an institutionally controlled process»,
- b. *Collaborative projects* invite visitors «to serve as active partners in the creation of institutional projects that are originated and ultimately controlled by the institution»,
- c. *Co-creative projects* involve «community members work together with institutional staff members from the beginning to define the project's goals»,
- d. *Hosted projects* «in which the institution turns over a portion of its facilities and/or resources to present programs developed and implemented by public groups or casual visitors».

These models are not linked to each other in a progressive relation and there is no hierarchy. Each museum can choose its own participatory model.

Moreover, different participatory tools can be used according to the degree of community participation the museums would like to achieve.

IAP2- International Association for Public Participation (2007) identifies the following spectrum of five levels of participation and related tools:

- *Information*, to provide public with information to assist them in understanding problems and potential solutions (example techniques: fact sheets; web sites, etc.),
- *Consultation*, to obtain feedback from the public about a problem, potential alternatives and/or decisions (example techniques: public comments, focus groups, surveys, etc.),
- *Involvement*, to work directly with the public (example techniques: workshops, deliberative polling) to ensure that the public concerns and needs are correctly understood and considered,
- *Collaboration*, to partner with the public in each aspect of the decision-making process (example techniques: citizen advisory committees, participatory decision-making),
- *Empowerment*, «to place final decision-making in the hands of the public» (example techniques: citizen juries, ballots, delegated decisions).

This could generate a variety of outputs (outreach programs, social laboratories, training activities, qualitative surveys, etc.) and heterogeneous results (creativity, new ideas, sense of belonging, social inclusion, etc.) able to impact on the community (self-determination, *empowerment*, social networks, etc.), the governance and the management processes.

Participatory models combined with the participation degree lead to archetypes which denote the role the museum recognizes to its community in the process of planning and spreading museum offer.

THE ITALIAN CONTEXT: METHODOLOGY

To explore this relationship in the Italian context and to understand the main implications on the governance and performance of local public museums, in 2013 we carried out a two-step survey on a sample of Italian municipal museums.

The sample includes 262 museums out of 1909 municipal museums listed by the Italian Government – MIBACT and the criterion for selecting the museums was the existence of a website.

In the first step, we tried to understand if these museums were engaging their communities. Starting from Simon (2010) and IAP2 (2007) studies, we examined the website of the selected museums to gather relevant information about the presence of: a museum mission compatible with an inclusive policy; deliberative arenas for citizens or their organizations; participatory projects; services for

different audiences; tools to detect audience preferences; cultural mediators and facilitators; physical areas where visitors can build their own cultural projects; services and web areas of interaction.

In the second step, we focused on six case studies out of the selected 262 museums, with the aim to define the archetype of community engagement, combining the adopted participatory model (Simon 2010) with the degree of participation (IAP2 2007) verified in each museum.

These museums are:

1. MART (Museo di Arte Moderna e Contemporanea di Trento e Rovereto) is located in Rovereto and in Trento, two municipalities with 39.271 and 115.368 inhabitants in Trentino Alto Adige. Its collection is composed of 15.000 art works including important nucleus of twentieth century avant-gardes. The Museum has also a specialized library and an archive,
2. Museo Civico "Amedeo Lia" is in La Spezia, a municipality with 92.474 inhabitants in Liguria. Its collection includes 1200 heterogeneous works from classical period up to the eighteen century,
3. Museo Civico Archeologico Etnologico is located in Modena, a municipality with 179.087 inhabitants in Emilia Romagna. The collection is exhibited according to a geographical criterion (Peru, New Guinea, South America, Africa and Asia areas),
4. Museo Civico Casa Cavassa is in Saluzzo, a municipality of 16.934 inhabitants in Piemonte. Its collection is composed of archaeological evidences and antiques belonged to Silvio Pellico and of antique furniture,
5. Museo Comunale archeologico del Finale is located in Finale Ligure, a municipality with 11.706 inhabitants in Liguria. Its collection is composed of archaeological evidences representing about 350.000 years of history of Finale territory,
6. Fondazione PInAC – Pinacoteca Aldo Cibaldi is located in Rezzato, a municipality with 13.378 inhabitants in Lombardia. The collection is composed of children's drawings. It is a dynamic, international museum that collects, classifies and analyses the creative forms of expression of children from different countries.

We interviewed the directors in order to: confirm the existence of community engagement practices observed in the preliminary survey; individuate their participatory model; assess the community participation degree; gather information about impacts and results of engaging practices both for museums and communities.

To this end we developed a qualitative questionnaire composed of 22 questions, as stated in Table 1.

Table 1 – Survey questions

Multiple choice questions:
Does the mission of the museum envisage explicit objectives in terms of cultural inclusion?
Does the museum plan any activity of community inclusion?
Why does the museum involve the community in its cultural offer?
How is the community involved in the cultural offer of the museum? Please, answer using the IAP2 Spectrum.
Who is involved in the cultural offer of the museum?
The museum involves the community in its activities. What kind of commitment does the museum take on towards it? Please, answer using the IAP2 Spectrum.
The museum involves the community in its activities. What kind of commitment does the museum propose to the participating community? Please, answer using the IAP2 Spectrum.
How does the relationship between the museum and the participating community take place? Please, answer using the IAP2 Spectrum
What tools does the museum use to provide the community with information about ongoing cultural offers?
How does the museum carry out activities concerning community analysis to plan its cultural offer?
Is in the museum staff any professional who works in cultural mediation?
Do community expectations and preferences influence the decisions of the museum?
Does the museum have well-equipped areas for projects proposed by the community?
How does the community take part to the decisions of the museum?
How does the museum monitor the projects that involve the community?
Does the museum provide the community with information about the outcome achieved? (e.g. Social Budget)
What goals does the museum want to achieve with regards to the segment of the community that is not currently taking part to the cultural offer of the museum?
What are the problems/obstacles that it is possible to face with projects involving the community?
Open questions:
What are the objectives of inclusion the museum pursue?
What aspects in the activities of community involvement in the museum can still be improved?
Likert scale questions:
What outcomes has the museum achieved through activities of community involvement?
What impact the activities of community involvement have produced?

RESULTS

The first phase of this research composed of the analysis of 262 museum websites gave the following results: the museums mainly achieved the community engagement for the outdoor museum communication. In particular, these institutions modified their images adopting social and online tools enhancing interaction with their communities (email, social networks, newsletter, and so on).

Moreover, 19% of the museums that declared inclusive assumptions in their mission, did not published any practice of community inclusion in their websites.

The second phase of this research aimed to deeper investigate six case studies. The interpretation of interview results proved that the participatory models are distinct, but at the same time many

institutions «move fluidly from one model to another, using different approaches for different projects and community relationships» (Simon 2010, 187-188). All the examined museums adopt community engagement practices choosing each time the best participatory model to gain specific objectives.

In few main sentences we summarized their engagement experiences and projects:

1. MART (Museo di Arte Moderna e Contemporanea di Trento e Rovereto). This museum declares objectives of social inclusion in its mission, evaluating “all the community, by promoting resources of creativity and initiative, in stimulating the interest of visitors and seeking their participation, sharing, interpreting and safeguarding an extraordinary collection”, “to create opportunities for all to learn”, “a museum that is full of vitality and has large-scale projects, a museum that represents the energy of places and people” and that gives “voice to different opinions and perspectives”. Moreover, MART declares to involve visitors to improve its cultural program including their skills and energies. It modifies, if necessary, its proposals to satisfy visitors expectations. This institution is oriented towards a collaborative participatory model, in fact it “sets the project concept and the staff members work closely with participants to make it happens”. But it is possible to perceive the fluidity of this model, investigating some of its projects, such as MART up!, during which the museum goes out its building to co-create, during creative workshops, with locals, and it invites them to become protagonists of the museum life.

Moreover, the community participates to the museum decisions thanks to a representative with voting right,

2. Museo Civico “Amedeo Lia”. This institution does not declare any position for social inclusion in its mission, even though it adopts an inclusive policy. It is experimenting the contributory model with an educational approach in which “the act of contributing provides visitors with skills or experiences”. Its projects involve specific targets, such as students and schools, to which the institution proposes cultural itineraries inviting them to suggest their preferences and their advice to improve the experience. According to the museum director, this participatory model has given modest positive results in the participation of volunteer visitors to the cultural activities and in the motivation of visitors’ cultural initiatives. Moreover, this institution thinks that this kind of policy is more expensive than the traditional one,

3. Museo Civico Archeologico Etnologico. Even though this institution has a generic mission concerning cultural projects, it can be considered an example of fluidity in the participatory model adoption. This museum cooperates with other museums of Modena and it is adopting a contributory model. During the last years, this museum has experimented an educational inclusive policy promoting

intercultural projects. Moreover, in 2012 during the “Philosophy Festival”, it encouraged a collaborative project applying the co-development category, according to which “staff members work together with participants to produce new exhibitions and programs”. In particular, the community becomes part of a work of art through their stories, memories and personal objects,

4. Museo Civico Casa Cavassa. The mission of this institution envisages an inclusive program developed through a contributory model: “the museum employs communicative methodologies and techniques adequate to different targets requirements” and “it organizes events and cultural activities in order to achieve different target of visitors”. Thanks to this policy, Cavassa museum has declared a significant increase of visitors and specific social categories participation to its cultural activities. The museum experiments collaborative projects applying consultative and co-development categories. The former is evident in “Le Nuvole a casa di Francesco” and in “1museo+5sensi=infinite esperienze”, projects that have been written with the cooperation of specialists and territorial associations; the latter, in the project “Incotriamoci al museo” during which new communication tools have been realized by students of a High school thanks to the museum coordination,

5. Museo Comunale archeologico del Finale. This museum has inclusive objectives in its mission, it intends to “fell cultural barriers for the fruition of the museum collection”. Even though the museum declares to involve its visitors asking them to co-project cultural activities, it does not give them the possibility to participate to the museum decisions. This institution proposes several cultural activities such as cultural itineraries, educational laboratories, cultural plays and trekking excursions to discover the territory. Moreover, it participates to a European project, titled “Accessit” improving the accessibility of its exhibition. The Finale museum adopts a contributory model to plan its cultural activities, to satisfy its visitors and to attract new visitors to the museum activities,

6. Fondazione PInAC – Pinacoteca Aldo Cibaldi. This institution has a generic mission that applies through cultural projects, even though it adopts a contributory model with two specific approaches. The first one is the necessary contribution «in which the success of the project relies on visitors active participation» (Simon 2010, 207); the second one is the educational contribution that provides visitors with new skills and experiences. The museum target is composed of children. They participate with their drawings to enrich the collection and cooperate during workshops with artists to the creation of new works of art. This institution experiments different forms of inclusiveness; the “Metissakana. Il meticcio come territorio dell'arte e dell'incontro tra le diverse culture” project, for example, has the objective to attract new targets of visitors, in particular immigrants, promoting a different cultural offer of its territory with a long-range planning.

DISCUSSION AND CONCLUSION

All the examined museums set and plan inclusive objectives for their visitors every year (5 museums out of 6), in order to share knowledge and cultural contents (6/6), to increase their visitors number (5/6), to promote cultural diversity (5/6), active citizenship and social cohesion (6/6).

All these museums include their community in the cultural offer. Moreover, they involve specific targets, such as researchers, tourists, schools and disabled people in project activities.

MART of Trento and Rovereto declares to plan activities aimed to the inclusion of minority groups, the museum of Saluzzo to involve families, the museum of La Spezia to work with religious community too; the museum of Finale to involve mental disabled people.

Moreover, it is interesting to underline “how” these museums promote visitors inclusion in cultural activities: 4 museums out of 6 give only adequate information to their visitors; two museums, MART and PiNac, consult visitors to obtain feedbacks for their cultural proposals, they involve them in the creation process aiming to know visitors’ needs and expectations.

The museums (4/6) that engage visitors with sufficient cultural information, also:

- collect visitors opinions through questionnaires and analyze their comments on museum social media,
- do not permit visitors participation to the museum decisions, even though, sometimes, visitors opinions can influence museum actions,
- establish a collaborative relationship with specific targets so that they can feel part of museum plans and they are able to enjoy the cultural offer,
- declare that the community engagement policy determines visitors increase (of specific targets as well). Moreover, they observe a more intensive participation to the cultural activities by marginalized social categories.

In all these cases, museums gain better performances including visitors and specific targets thanks to communicative activities on their territories and without transferring any decisional power.

MART of Rovereto and PiNac of Finale Ligure follow different ways of community engagement.

The former establishes a deeper relationship with its community, planning decisional processes. In particular, its engagement activities follow a deliberative model because:

- it consults visitors through deliberative workshop and it modifies its policy to answer visitors demands;
- it involves a visitors' representative with voting right in its decisional body;
- it adopts tools of accountability (annual report).

It is interesting to observe the important results gained by MART engagement activities such as the acquisition of new collections and the increase of museum financial resources. In its territory, the museum observes some impacts, such as: more intensive cultural initiatives by the community, the creation of new social networks, the spreading of new ideas, services and models to face social problems.

The latter tries to involve its visitors in co-creating processes of cultural plans but they have to respect museum rules and they do not have any deliberative power. The results are the increase in public satisfaction and a better sustainability of cultural projects.

In the end, these outcomes point out an interesting change in 5 out of 6 museums: all of them have employed specialists in cultural mediation to achieve their inclusive objectives.

As for the international debate on the issue, our survey's results achieve the following conclusions: community engagement cannot be considered as a homogeneous practice; we can identify three archetypes of strategy; community engagement produces benefits also for the organization.

According to the adopted participatory model and the degree of participation, communities can have different roles in this process. They can be: (a) customers of an offer for which they express directly or indirectly preferences (no decision-making transfer); (b) providers that co-produce museum offer (operational decision-making transfer); (c) entrepreneurs that co-create museum offer assuming the risk of failure (governance sharing).

The related managerial implications are clearly different. In the first case (a) changes would affect the contents of the museum activities re-directing resources for: museum communication and education services; analysis, information and consultation of the audience; cultural mediation and hospitality services for different audiences.

In the second case (b) a new relationship between museum and community arises. It can follow the rules of the volunteering, as open access, or employment contract or service supply. In this hypothesis the main impact would concern the operational structure of the museum, having to provide

professionals, tools and suitable places for the coordination of the co-production processes and the feedback management.

In the third case (c), changes include governance processes. Community would share the decision-making process with the museum, creating a participatory governance that can assume different models, from a deliberative unit for the representatives of the community to community organization as community-based museums (Unesco, 2010).

Ultimately, the relationship between museums and communities can take place through various models and with different intensity. Although they relate to different managerial implications and solutions, they all have the same starting point: sharing cultural authority with their community.

THE EXPERIMENTAL LAB: A TOOL FOR ENTREPRENEURIAL UNIVERSITY

Iscaro, Valentina¹; Castaldi, Laura¹; Sepe, Enrica²; Turi, Claudio¹

¹Department of Economics and Management, Second University of Naples, Italy

²Department of Economics, Management, Institutions, University of Naples "Federico II", Italy

ABSTRACT

The overall goal of this work is to provide a contribution to the studies that aim to boost the entrepreneurial activity of universities, exploring whether the experimental lab could be an effective tool to support aspiring entrepreneurs in turning their ideas into real start-ups. The experimental lab is a network of entrepreneurial individuals from universities, research labs, financial markets and industry who become part of an innovative ecosystem in order to sustain entrepreneurship. Starting from the assumption that university has to leave the "ivory tower" in which it has been isolated from reality and that, instead, it has to assume an active role in favouring entrepreneurship, this research has adopted a concrete approach, investigating the structure of experimental labs as tools supporting universities in their entrepreneurial vocation.

Basing on literature review and on a focus group, we designed a virtual platform for an experimental lab, to be concretely tested in its functioning by a simulation (role play).

Keywords: *Experimental lab; entrepreneurial university; entrepreneurship*

INTRODUCTION

In an environment where uncertainty is the main feature, entrepreneurship represents an important research field as it is connected to the chance of detecting new opportunities, sustaining social and economic development. It should also be considered that, due to the economic crisis, the importance of entrepreneurship has also increased, as the possibility to become entrepreneurs has been seen as an alternative to the lack of employment.

Modern knowledge-based economies urge universities to embrace the third mission, i.e., to promote economic and social development, and regard themselves as critical factors in the development process (Etzkowitz, 2004; Etzkowitz and Leydesdorff, 2000). As highlighted by Etzkowitz and Leydesdorff (2000), the future role for the entrepreneurial university is based on alignment of the academic mission based on teaching and research with structure and functions based on real economic development. This leads to the notion of entrepreneurial university.

The university system can effectively promote entrepreneurship. Indeed, it can play a central role, sustaining the development of new ideas from would-be entrepreneurs (Rothaermel *et al.*, 2007). In the attempt to contribute to the activity of universities favouring entrepreneurship, and led by the belief that potentially implementable results have to be achieved, this research sheds light on the adoption, by entrepreneurial universities, of a new tool, the *experimental lab*, in order to provide aspiring entrepreneurs with fertile soil and a strong network to progress from an idea to a real start-up. The experimental lab is a network of individuals “federated” from universities, research labs, financial markets and business partners, who become part of *an innovative ecosystem* by means of a virtual platform, rather than relying only on their capabilities (Andersson *et al.*, 2010; Curley and Formica, 2012a).

Basing on literature review and on a focus group, we concretely designed a virtual platform for an experimental lab, to be subsequently tested in its functioning by a simulation (role play). The research project was carried out in four steps: 1-literature review; 2-first projecting of the platform design; 3-focus group; 4-revision and ultimate version of the experimental lab platform.

Thus this work provides a contribution to the studies that aim to boost the entrepreneurial activity of universities, exploring the characteristics of experimental labs as a tool to support aspiring entrepreneurs in turning their ideas into real start-ups and suggesting a specific structure for their everyday dynamics.

The paper is organized as follows.

Section 2 presents a literature review on the stream of research coping with entrepreneurial university. In Section 3 we focus on the experimental lab as a concrete instrument for entrepreneurial universities and discuss the characteristics of designed virtual platform. Conclusions follow in Section 4.

ENTREPRENEURIAL UNIVERSITY

In the last 30 years, the literature on university entrepreneurship has been rapidly expanding both in the United States and Europe (Rothaermel *et al.*, 2007). Even if the entrepreneurial university literature is relatively recent, it has been growing fast due to its importance for economic and social progress.

University has been part of two important revolutions that have changed and enriched its mission: from teaching to research, and from research to entrepreneurial vocation. University’s “third mission” is to promote economic and social development (Etzkowitz and Leydesdorff, 2000; Etzkowitz, 2004). Modern knowledge-based economies urge universities to embrace the third mission and regard themselves as critical factors in the development process: entrepreneurship begins in Academia.

The entrepreneurial university has the ability to generate a focused strategic direction (Clark, 1998), both in formulating academic goals and in transforming the knowledge produced within its boundaries into economic and social useful means (Etzkowitz and Leydesdorff, 2000).

The entrepreneurial university literature has been growing fast due to the importance of the matter for economic and social progress. In such a rich literature it is possible to recognize four main research streams (Rothamel *et al.*, 2007):

- entrepreneurial university;
- productivity of TTOs (technology transfer offices);
- new firm creation;
- environmental context.

The entrepreneurial university research stream has the general purpose of revealing which organizational designs, tools and other means (location, status, culture, experiences, incentive system, etc.) can favour or inhibit the commercialization of university inventions and in general their entrepreneurial vocation. The general question this stream seeks to answer is (Henrekson and Rosenberg, 2001; Di Gregorio and Shane, 2003; Etzkowitz, 2003; Friedman and Silberman, 2003; Siegel *et al.*, 2003): How can universities become more successful in their entrepreneurial activities? Findings suggest that, in order to embrace its third mission, university governance does not need to become expert in commercialization, sacrificing its academic mission. The university should adopt an “umbrella strategy” (Mintzberg and Waters, 1985), i.e. a general series of guidelines of behaviour inside which entrepreneurship and innovation are fostered without altering its original aims. As Etzkowitz and Leydesdorff (2000) highlighted, the future role for the entrepreneurial university is based on alignment of the academic mission based on teaching and research with structure and functions based on real economic development.

The second stream analyses the productivity of technology transfer offices, which is considered a key driver and determinant for the universities’ entrepreneurial activities. The technology transfer office (TTO) plays an active role when university faculty members, students or staff recognize or discover a new technology or invention that has commercialization potential. Once the new technology or invention is disclosed to the TTO, it is responsible for patenting (Friedman and Silberman, 2003). Several factors have been identified as relevant to productivity, i.e. structure and staffing, the different mechanisms of technology transfer, the transfer office system, faculty, university system, degree and type of relation between TTO and the university. It has been demonstrated that universities can determine the performance of the TTO by acting on relationships, resources, incentives, and commercialization strategy (Feldman *et al.*, 2002; Markman *et al.*, 2005). The university usually tries to encourage and support knowledge disclosure by licensing contracts and incentives for faculty to

disclose inventions (Jensen *et al.*, 2003; Siegel *et al.*, 2003). In an overall vision, the TTO can be seen as a gateway for university inventions favouring the relationship between “university innovators” and the outside environment.

The third stream investigates the process of new firm creation. Various ways have been developed to classify newly created firms (Carayannis *et al.*, 1998; Nicolaou and Birley, 2003). As argued by Rothaermel *et al.* (2007), beyond the attempt to classify the various new ventures, the overall aim of this stream has been on the one hand to identify all the types of factors that can impede the formation and growth of spin-offs (informational gap, lack of competencies, unsupportive university culture, etc.) or can favour the process (university involvement, management of intellectual property, resources, networking activities, etc.) (Chiesa and Piccaluga, 2000; Steffensen *et al.*, 2000; Di Gregorio and Shane, 2003; Rothaermel *et al.*, 2007), and on the other to investigate the role of the founder’s social network that can have an implication on the type of spin-off and especially to what extent human resources and technology are relocated into the new venture (Shane and Stuart, 2002; Grandi and Grimaldi, 2003). Another theme widely investigated is the impact of the university system, meant as general policy and incubation models, theme that has contrasting findings. Where some studies demonstrated that a high involvement of the university is positively correlated to new venture creation and performance (Di Gregorio and Shane, 2003; Rothaermel and Thursby, 2005), others highlighted dependence and low profile performance due to a strict tie with university (Johansson *et al.*, 2005).

The fourth and last research stream is the one looking at the environmental context, including networks of innovation, which scholars firmly believe to be an essential feature for universities to become entrepreneurial. In particular, the literature identifies various factors that can influence the entrepreneurial process: amongst others *innovation networks*, *incubators* and *geographic location*. As to innovation networks, their positive impact on the entrepreneurial activity of the university is evident (e.g. firm productivity, R&D capability) (Adams *et al.*, 2001; Murray, 2004). Incubators are innovative systems designed to assist entrepreneurs, particularly technical entrepreneurs, in developing new firms by providing a variety of services and support to start-up and emerging companies (Smilor, 1987). Finally, as regards the geographic location, some studies have particularly analysed the proximity of start-ups to universities that can be both a prerequisite or a consequence of the entrepreneurial effort (Van Dierdnock *et al.*, 1990).

Thus, if it is from knowledge flows, network, concrete tools/services and collaboration that entrepreneurial innovation can emerge, universities have to exploit their knowledge base and collaboration opportunities to encourage and support entrepreneurial initiatives and ideas.

So the University Ecosystem (UE), as conceptualized by Curley and Formica (2012b), is a “community of personnel” (professors, researchers, students, external professionals) that interact with each other and with the external environment to generate entrepreneurial innovation. Sharing and collaboration, in such an ecosystem, are structured in a variety of forms: common research projects and papers, people to people and patent exchanges, cross-licensing agreements, shared copyrights, etc. This new way to co-create value is related to the open “innovation 2.0” which, as defined by the EU Open Innovation and Strategy Policy Group (OISPG, 2012), considers collaboration and networking as a way to maximize the innovation base of organizations, the knowledge and creative capital at their disposal. Innovation 2.0 is based on sharing in order to innovate, through the exploitation of ideas and knowledge flows (Curley and Formica, 2012b). Thus, the UE identity is shaped like a “starfish”: decentralized, with non-hierarchically ordered social norms, without walls to protect ideas, and built on openness and connectivity, in contrast to a “spider-like” identity (typical of closed innovation systems), centralized, built on social norms, rules and power relations (Brafman and Beckstrom, 2006). In the light of this open way to innovate, new tools are essential to allow new ideas sharing and the afterward-entrepreneurial activities: we believe that the experimental lab might be one of these tools.

THE EXPERIMENTAL LAB

Literature review

This study focuses on the adoption by universities of an experimental lab, a tool that might help university support aspiring entrepreneurs to turn ideas into start-ups.

Thus, experimental labs could allow universities to embrace their third mission, i.e., to promote economic and social development, and regard themselves as critical factors in the development process (Etzkowitz, 2004; Etzkowitz and Leydesdorff, 2000).

Aspiring entrepreneurs, before entering the market, can exploit the experimental lab to “test” their ideas and reduce the risk associated with the uncertain entry in the market of a new innovative idea. The lab works by evaluating the full spectrum of ideas, monitoring and reviewing their basic assumptions and forecasting the performance-gain underlying these assumptions. In the experimental lab community high expectation entrepreneurs explain their business ideas to receive feedback in a peer-to-peer exchange, to make the idea ready for launch in the marketplace (Curley and Formica, 2010). The experimental lab creates a dynamic environment that links, in a new and unexpected way, aspiring entrepreneurs, academics, researchers, experts and practitioners. The daily work of a laboratory is building upon each other’s ideas; it is sharing to improve. Each member achieves a result thanks to other members’ suggestion.

The experimental lab offers the possibility to perform an iterative process of analysis, in an evolutionary way between mentoring and coaching. In contrast to incubators, “try” rather than analyse is a culture encouraged by labs; experience is a way, for entrepreneurs, to find their own path thanks to the network. For this reason “diversity” is the essential feature in team composition: members must have different backgrounds to contribute to the transition from an idea to a start-up.

Given participants’ diversity, the experimental lab literature has hypothesized different possibilities to structure the team, even though it has not yet reached a final solution. One of the general solutions is that participants can be divided into two major groups: problem seekers and problem solvers (Curley and Formica, 2008; 2010). Problem seekers have to identify the problems that the idea might have in the real market. Solvers find possible solutions for these problems. The two groups are interchangeable: at each iterative step, seekers become solvers and vice versa. But this general distinction says nothing about how to concretely compose the best team to process the different ideas. Taking a step forward it is possible to identify three potential options to compose a team and to organize the work in the experimental lab (Curley and Formica, 2013; Matricano and Pietrobon, 2010). One possibility is that each member involved makes a critical analysis of his/her own capabilities and competences to evaluate the compatibility with the idea. This way the possibility of having a good team that works on the idea is entrusted to the self-analysis that each member should carry out, not only on their own capabilities, but also on the fitness between the idea and their personal background. The risk of this option is that without an external observer the objectivity of the match idea-workers might be compromised.

Another possibility is that some senior managers or directors of the lab act as decision makers, choosing the most suitable participants, already inside the network or outside of it. In this perspective, the decision makers will mediate amongst the lab members, the would-be entrepreneur and experts not yet enrolled (Curley and Formica, 2013; Matricano and Pietrobon, 2010). While this option puts another actor in the evaluation process, it limits the possibilities for the participants to choose the ideas most intriguing to them and, as a consequence, their motivation to participate.

The third option is the “venture sitter” (Matricano and Pietrobon, 2010). This figure would not be a manager of the lab but an active participant who may constitute the missing link between the lab’s network of experts and the start-up idea. The venture sitter should examine the characteristics of the idea and experts’ capabilities to choose the best combination between project and members who will arrange the team. His/Her role is not only to choose the team members most suitable for the idea in question, but also and mainly to support aspiring entrepreneurs during the whole process of idea development.

The experimental lab is based on the job of virtual teams that analyse, process and test the business ideas into a shared virtual space. In this vein it is evocable the concept of ba (Nonaka and Konno, 1998) as a shared space (physical, virtual or purely mental) in which not only relationships but also knowledge comes from common experiences, whether direct or indirect. The ba is a platform to promote and share individual and collective knowledge (Nonaka *et al.*, 2000). From this perspective the experimental lab platform might represent a ba, meant as a virtual space to produce knowledge in a peer-to-peer relationship, exploiting the web 2.0 as a facilitator and stimulus to the creation of unstructured community environments, influential on sharing and exchange (Migliaccio *et al.*, 2011). From a cognitive perspective, experimental labs can represent a lever for knowledge creation and exploitation (Iscaro and Castaldi, 2014). Indeed, idea exploitation and development and new venture creation through experimental labs lie in the characteristic of “multiplicability” peculiar to knowledge, meaning that knowledge assets – as opposed to the spatio-temporal locality of traditional tangible assets – can be shared with others and retained at the same time, do not deteriorate but, on the contrary, appreciate with use, and can be employed an infinite number of times without running out (Boisot, 1998; Davenport and Prusak, 1998; Grant, 1996; Rullani, 2004).

Indeed, the daily work of an experimental lab builds upon members’ knowledge and the goal is sharing to improve. Thus the experimental lab enhances the multiplicability of knowledge assets. It makes knowledge sharable within the network, preventing it being relegated to a simple personal ability. This calls for externalization through the adoption of mechanisms fostering the conversion of the tacit knowledge of people involved in experimental labs into more explicit cognitive assets, thus making individual knowledge easier to spread within the network.

Designing a virtual platform

Although the literature on the experimental lab has pointed out different solutions to organize the daily work, it has not yet reached a final solution and there were still open issues that it was necessary to resolve in order to design a virtual platform in which to actually realize the functioning of an experimental lab: concrete creation and organization of teams per cognitive area; value appropriation and regulation of relations; virtual network fragility.

In order to dispel doubts and controversies before completing the final version of the platform structure, we had to organize a focus group with experts who, with their knowledge and capabilities, helped us identify the possible concrete solutions. The focus group provided several useful indications for the design of the platform.

The platform was built as a traditional website to be managed by the university. We designed the platform considering actors, rules and resources (Klabbers, 2003).

The lab was built on three actors/roles: aspiring entrepreneur, venture sitter, human resources. Anyone can be an *aspiring entrepreneur* with a good idea but this is doomed to be forgotten without the necessary support: thanks to the experimental lab aspiring entrepreneurs become part of an innovative ecosystem rather than relying only on their own resources. With a supposed background in entrepreneurship and/or management, the *venture sitter* is a role somewhere between a mentor and a coach. The venture sitter helps the aspiring entrepreneur choose the most suitable human resources and define timing and goals, also providing him/her with indications to advance and assess the outputs from the human resources. In the experimental lab, thanks to *human resources*, the aspiring entrepreneurs can access competences, skills and experience not possessed, in order to explore, analyse and define their ideas.

Rules and resources that make the daily exchange of knowledge and experience possible in the designed platform are:

- *mechanisms of externalization and sharing* (messaging, forums, videoconferences, meetings) through which all members of the lab can easily share their own intellectual capital;
- a *non-disclosure agreement* with the aspiring entrepreneur. This rule guarantees the non-disclosure of aspiring entrepreneurs' ideas by all members of the experimental lab;
- the rule of "*work-for-equity*" to remunerate participants. As all agents involved assume the risk of enterprise, they do not overload the financial situation of the rising firm and follow the principle of "the success of one is the success of all": all together bet on the idea;
- the *Stage&Gate model* as a process for the development of business ideas.

In the everyday work of the experimental lab, the starting point is an aspiring entrepreneur who "*entrusts*" his/her idea to the community of the lab. Ideally, the platform administrator (university) through an internal team of experts in entrepreneurship and innovation, analyses all the ideas submitted in order to select the most valid, those that actually will be "processed" in the lab. This step is followed by a match between aspiring entrepreneurs and venture sitters made by the platform administrator (also following aspiring entrepreneurs and venture sitters' preferences).

After these preliminary steps the real work begins. Together, aspiring entrepreneur and venture sitter identify the different cognitive areas required (e.g., marketing, legal, information technology, chemistry, graphics, digital, etc.) and the human resources for each one. Once human resources have agreed to participate in the project, they access the model *idea in progress*, based on the Stage&Gate model (Cooper, 1994; Cooper *et al.*, 2002). The stages are where the work is done; the gates are checkpoints that guarantee a satisfactory quality. The platform is based on five stages: scoping, building a business case, development, testing and validation, market launch. Between the stages there are gates, checkpoints for quality control. The gates deal with three problems of quality: quality

of execution, business rationality and quality of the action plan. They are confrontation moments with the general aim of assessing the real attractiveness and feasibility of the project based on a *go/no go* decision logic.

CONCLUSIONS

Nowadays, the broad interest in the entrepreneurial phenomenon is due to the awareness that entrepreneurship is an essential lever to cope with a complex economic scenario (Hitt and Reed, 2000). The environment in which companies have to compete today is characterized by increased risk, scarce ability to forecast and vulnerable boundaries. In a new landscape, where uncertainty is the main feature, entrepreneurship represents an important research field that offers the chance to detect new opportunities.

Studies about entrepreneurship have pointed out that there are several conditions, not only related to the individuals but also to their environment, that can play a significant role in determining not only the decision to enter the market, but also the likelihood of succeeding. In particular, this research points out that aspiring entrepreneurs, who only have an idea and an entrepreneurial inclination, can succeed thanks to the support of the experimental lab in a process that sees university as playing a decisive role through the adoption of mechanisms and tools able to favour entrepreneurial innovation. This study tries to fit in a literature gap, analysing how to concretely build an experimental lab as a new means to support entrepreneurship exploiting networks, collaboration base and relational capital of the university. We provided suggestions for three still undressed issues: 1) team creation for which we propose a structure of the virtual platform based on three roles, the job organization in cognitive areas and the selection process among aspiring entrepreneur, venture sitter and human resources, 2) value appropriation and regulation of relationships for which we suggest the *work for equity* principle and the non-disclosure agreement and 3) the job process and virtual network fragility that we suggest to conduce/overcome by an everyday job routine based on the Stage&Gate model (Cooper, 1994).

We suggest that experimental labs, when properly designed, could allow universities to embrace their third mission, thus leading to the notion of entrepreneurial university (Etzkowitz, 2003; Di Gregorio and Shane, 2003; Friedman and Silberman, 2003; Henrekson and Rosenberg, 2001; Rothamel *et al.*, 2007; Siegel *et al.*, 2003). As highlighted by Etzkowitz and Leydersdorff (2000), the future role for the entrepreneurial university is based on alignment of the academic mission based on teaching and research with structure and functions based on real economic development.

The overall goal of this work was to provide a contribution to the studies that aim to boost the effectiveness and usefulness of universities in favouring entrepreneurship.

The belief that nothing can promote growth like a university system able to reconcile teaching, research and entrepreneurial vocation was the leitmotif for this project. Starting from the assumption that university has to leave the “ivory tower” in which it has been isolated from reality and that, instead, it has to assume an active role in favouring entrepreneurship, this research has adopted a concrete approach, investigating the structure of experimental labs as tools supporting universities in their entrepreneurial vocation. In this vein, in the next step of our research project, designed platform will be tested through a simulation by role play in order to assess its effectiveness in helping aspiring entrepreneurs to analyse, process and develop their business ideas, thus leading to the creation of real start-up firms.

CORPORATE ICT STANDARDISATION MANAGEMENT - LESSONS FROM THE LITERATURE AND FROM CASE STUDIES

Jakobs, Kai

Computer Science Department, RWTH Aachen University, Aachen, Germany

ABSTRACT

The paper discusses how companies could use the management of their ICT standardisation activities to improve their competitiveness and possibly also their innovativeness. It presents findings from a literature review and three case studies. Based on these findings, a number of general managerial implications are derived, as are a number of concrete recommendations for action.

Keywords: *Standardisation, Standardisation management, ICT, Literature review, Case studies*

INTRODUCTION, BACKGROUND AND MOTIVATION

Some Introductory Remarks

Even if we disregard social, moral and religious rules for the moment, standards – in a very general sense – have been with us for quite some time: About 5,000 years ago the first alphabets emerged, enabling completely new forms of communication and information storage. Some 2,500 years later, the first national, coin-based currency, invented by the Lydians, established the basis for easier inter-regional trading. The industrial revolution in the 18th century and the advent of the railroad in the 19th century resulted in the need for technical standards, which was once more reinforced when mass production generated a demand for interchangeable parts. In parallel, the invention of the electric telegraph in 1837 triggered the development of standards in the field of electrical communication technology. In 1865, the International Telegraph Union – to become the International Telecommunication Union (ITU) in 1932 – was founded by twenty states. The other major international standards setting body, the International Organization for Standardization (ISO), was established in 1947.

These days, numerous SDOs (Standards Developing Organisations¹) issue what is commonly referred to as ‘de-jure’ standards – although none of their standards has any regulatory power per se. Likewise,

¹ I.e., for instance, ISO and ITU at the global level, ETSI (European Telecommunications Standards Institute) at regional level and ANSI (American National Standards Institute) at the national level

a plethora of private industry fora and consortia¹ produce so-called 'de-facto' standards. As a result, there exists an almost impenetrable maze of what is generally called 'standards'. Moreover, one may distinguish between different types of standards: there are voluntary, regulatory, de jure, de facto, pro-active, reactive, public, industry, and proprietary standards; this list is by no means exhaustive. As Andrew Tanenbaum put it: *"The nice thing about standards is that there are so many to choose from."* [Tanenbaum, 1988, p. 254].

Every Information and Communication Technology (ICT) system, from the most complex corporate infrastructure of some globally operating company down to the humble PC on the desk back home incorporates scores of standards. There are standards for operating systems, programming languages, user interfaces, communication protocols, hard disk drives, cables and connectors, etc. In fact, in the field of ICT international standards are the one major mechanism to ensure interoperability between different systems. Accordingly, standards that suit a company's needs, for example by incorporating its Intellectual Property, by anticipating its implementation activities or by helping create a new interesting market represent a considerable competitive advantage. Thus, participation in standards setting and influencing the process to one's own benefit has become a major strategic tool, utilised especially by the large players. But standards also have other characteristics that make them interesting for many companies (not necessarily only for the big ones). For example, they are a valuable means of technology transfer, which makes them relevant also for academia, research institutions and corporate R&D departments (see e.g. [Blind, 2006]). Moreover, the process of standardisation is not that dissimilar to pre-competitive joint research. That is, standardisation also provides a legal platform for co-operation with competitors and (potential) customers.

Standardisation and Innovation

Close links between standardisation and innovation may generally be identified. The times when statements along the lines of 'standardisation hampers innovation' were believed to adequately describe this link are (mostly) gone by now. However, the unqualified 'standards foster innovation' does not fully reflect reality either. Swann & Lambert [2010] observe that standards do both – enable and constrain innovation – but that the enabling aspect is much more important. Specifically, they note that *"... standardization does constrain activities but in doing so creates an infrastructure to help trade and subsequent innovation. Standardization is not just about limiting variety by defining norms for given*

¹ The more prominent, long-standing ones include, for example, the WWW consortium (W3C), the Organization for the Advancement of Structured Information Standards (OASIS) and the Open Group.

technologies in given markets. Standardization helps to achieve credibility, focus and critical mass in markets for new technologies” (p. 370).

That is, especially in the field of ICT many standards describe a commonly agreed platform upon which innovations can be based and marketed. Accordingly, standards may be, and indeed are, used as strategic tools. For example, a new standard can extend a market, or even help open up a whole new one (just think what GSM¹ did for mobile communication). On the other hand, backing and subsequently being locked into a ‘wrong’ technology (i.e. one that does not get standardised) may well ruin at least a smaller company.

What’s more, *“Standards are not only technical questions. They determine the technology that will implement the Information Society, and consequently the way in which industry, users, consumers and administrations will benefit from it”* [CEC, 1996]. That is, those that develop ICT standards today at the same time shape much of the ICT environment we all will use in the future. And if they do their job properly, i.e. if they develop systems that meet the needs of all stakeholders (including e.g. individuals, communities, businesses, and governments) society at large stands to benefit. On top of that, from a different perspective and in line with a number of other studies, DIN [2004] finds that *“standardization contributes to GDP growth at the rate of about one percentage point per annum”*,

Today, active participation in relevant Standards Setting Organisations² (SSOs) has become a sine-qua-non for many companies, in order to remain competitive (see e.g. [DeNardis, 2011]).

Managing Standardisation

The observations above might lead to the assumption that companies take standardisation very serious and that it may even be considered as being as important as innovation. In other words, one might be tempted to assume that the ability to be successful in standards setting is about as important as the ability to innovate. One could also be led to assume that sophisticated management mechanisms are in place (at least in large companies) to help make sure that a company’s interests are adequately represented in the international standardisation arena. Yet, at least anecdotal evidence – and the lack of (academic) literature on the topic – suggest that this is not necessarily the case.

In fact, some companies indeed seem to have a well-defined standardisation strategy. Yet, apparently quite a few others seem to have adopted more of a laissez-faire approach. Some have a central standardisation department, for others it is more of an un-coordinated and distributed activity. While

¹ The GSM standard (Global System for Mobile Communications) was developed by ETSI. It describes protocols for second generation (2G) digital cellular networks. It had a market share of about 80%.

² This term is used to denote both formal SDOs and private standards consortia.

some manage, monitor and track the standardisation activities of their staff, others do not have a clue of who is doing what in their name in which standards bodies. To make things worse, earlier research (see e.g. [Jakobs et al, 2001], [Jakobs, 2011]) suggests that those active in standards working groups do not necessarily always represent their employers' interests. The vast majority of companies, however, especially SMEs, hardly participate at all in standards setting (see e.g. [Gerst & Jakobs, 2007]). As a result, many of them miss out excellent opportunities to capitalise on their innovations.

In the ICT sector standardisation standards that may eventually compete in the market for dominance may emerge from different SSOs. In-depth knowledge about the respective origins of these standards (i.e. the SSOs that developed them) is crucial for an educated guess about the likely winner. This knowledge also need to cover the characteristics of the individual SSOs. They differ in various respects, perhaps most importantly in terms of their Intellectual Property Rights (IPR) regimes. Accordingly, the selection of the SSO that would be best suited for a particular standardisation activity is a fairly complex exercise. This paper sets out to simplify this task a bit.

The remainder of the paper is organised as follows. A brief summary of the findings from a literature study comes first. Insights gathered from the case studies are subsequently discussed in the light of these findings. Finally, concrete recommendations and more general managerial implications are identified.

INSIGHTS FROM THE LITERATURE REVIEW

As mentioned above, the literature on standardisation management is thin on the ground. Accordingly, insights from other fields need to be consulted here as well. In this paper, these include primarily general standardisation research, stakeholder research, strategic management and social capital theory. Fig. 1 shows the high-level framework based upon which the literature review has been structured.

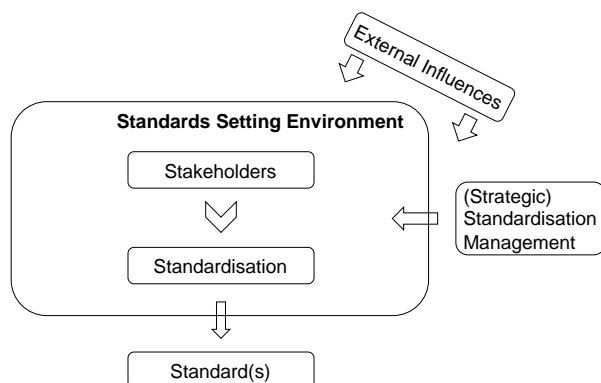

Figure 1: A Very simple view of what influences a standard

External Influences

External factors can hardly be influenced from inside the standards setting environment. Yet, they may have significant ramifications on it. This holds particularly for changes in policies or for new regulations that come into force. A recent European regulation [EU, 2012], for instance, stipulates that under certain conditions consortium standards may be considered as equivalent to European Standards in public procurement. This represents a U-turn from the European Commission's previously held position that pretty much ignored the existence of consortium standards [EC, 1998].

Technical progress is another such external factor that may heavily impact standards setting. For example, nanotechnology received increased scientific, political and commercial attention in the early 2000s – ISO TC 229, 'Nanotechnologies' was established in 2005 (see e.g. [Bennett et al., 2009]). And it is hardly coincidence that ETSI was founded in the same year (1988) the Groupe Speciale Mobile completed the first set of detailed GSM specifications (in 1989, the group was transferred to an ETSI technical committee).

Society at large also influences any technical development including standardisation through prevailing societal norms and changes thereof. In Victorian times, for example, the enthusiasm for science led to a huge number of inventions and innovations. More recently, increased environmental awareness helped trigger the development of the ISO 14000 family of standards. The impact of societal norms typically takes some time to be actually felt, but once it has materialised it may be quite strong and long lasting.

Stakeholders

Looking inside the standardisation environment stakeholder identification and classification – especially which stakeholder categories exist in which fields of standardisation – are not particularly advanced in standardisation. Some very generic definitions from ISO or ANSI exist ('business', 'government', 'consumers' and 'other' stakeholders; [ISO, 2010]), but they are too generic and the respective members much too heterogeneous to be of any practical use. For the ICT sector, five high-level categories of stakeholders may be identified [Jakobs, 2013]:

- society at large (which also covers e.g. consumers),
- governments,
- institutions (e.g. companies, umbrella organisations, universities, R&D institutes),
- the Standards Setting Organisations,

- the individual standards setters.

The former two are external to the standards setting environment (see also Fig. 1 above).

‘Institutions’ are the most important and powerful stakeholders in ICT standards setting. More specifically, large manufacturers and service providers are typically most influential; SMEs and research entities are far less represented. These players have different means to influence the standards setting process, direct participation being the most popular and effective one. Here, influence may be exerted at different levels – in WGs for the more technical aspects and in an SSO’s policy making body or on a leadership position for the more strategic issues.

The SSOs also play an important role. An SSO offers a platform for standardisation activities. Typically, its policies and by-laws specify the IPR policy, the distribution of power between different classes of members (if any), the decision making process, the level and scope of co-operation with other SSOs, etc. The characteristics of this platform will to a considerable extent shape the scope and the outcome of its work and, particularly, its membership base.

Finally, and frequently forgotten, there are the individuals. After all, they perform the actual technical/strategic work that will shape the final standard. Accordingly, they influence standards development not only through technical contributions, but also through non-technical skills like diplomacy, alliance formation or good rhetoric. According to Umapathy et al. [2007]: *“The human dimension of standards setting is an important component of the consensus-based process ...”*.

That is, experienced employees with a large network of peers across different companies and groups, i.e. those who have accumulated social capital, represent a considerable asset to any company (see e.g. [Bourdieu & Wacquant, 1992]). Dokko & Rosenkopf [2010] argue that knowledge brought in by a new employee may help increase the employer’s influence also in standards setting. Along similar lines, Isaak [2006] observed that *“repeated collaborative problem solving over an extended period of time building respect, trust and reinforcing common values”* led to a development of social capital by the WG members. This, he claims, was a crucial factor in the standardisation of the Posix operating system.

It is, however, not always clear up-front whether or not WG members will act in the best interest of their respective employer. Not least because of this uncertainty the selection of representatives with suitable expertise and experience and their briefing is a managerial issue whose importance should not be under-estimated (see e.g. [Isaak, 2007], [Jakobs, 2011b]).

Standardisation

Standardisation is not a homogeneous process, carried out under one single set of guidelines, policies and by-laws.

Especially in the ICT sector standardisation managers are faced with a highly complex web of SSOs. This is primarily due to the enormous proliferation of industry standards consortia and fora during the 1990s and 2000s. The links between these individual SSOs are not always easy to identify and understand. Some SSOs compete in very similar fields, some co-operate, some don't have any relations at all and just exist in parallel. For a more detailed discussion of the web of SSOs see e.g. [Jakobs, 2013].

Not only the web of SSOs is complex. The individual organisations may differ considerably in terms of, for instance, relevance, credibility, voting procedures, membership and membership levels, types of output documents, level of consensus required and IPR regime. Updegrove [2006] discusses these characteristics and their potential ramifications; Updegrove [2003a, 2003b] provide real-world examples how large companies address these issues.

(Strategic) Standardisation Management

'Strategic Standardisation Management' (SSM) is "*A management discipline and methodology that investigates all aspects of standardization across a business and/or industry, then defines, recommends, and implements appropriate strategies and policies to leverage standardization so that a firm can gain competitive advantage and avoid disadvantage*" [Betancourt & Walsh, 1995]. In the 1990s, ANSI ran the 'Center for Strategic Standardization Management' to assist companies that aimed at adopting this approach.

Along similar lines, Bousquet [2003] notes that "*The 'standardization in the enterprise' function, like quality must clearly take place at a management level and the experts who will participate in the standardization work will be the true spokesmen for their firm's strategies*",

Basically, SSM argues that standards may have a considerable impact on a company's business. Therefore, active participation in their development should be seen as a strategic tool that needs to be carefully managed and to be aligned with the company's overall business strategy in the relevant sector (see e.g. [Forselius, 1998]. Accordingly, a dedicated central entity needs to be charged with the management of standards and standardisation. Specifically, standardisation must not be considered just a technical issue, neither should it be associated only with the engineering domain. For example, process standards like the ISO 9000 series affect all departments.

Ultimately, the literature study led to the identifications of (several of) the most important factors that may have an impact on the development of an ICT standard and its subsequent adoption and diffusion. These factors, and their respective relevance for a firm need to be taken into account by any corporate standardisation management function. These factors are depicted in Figure 2, along with the links between them .

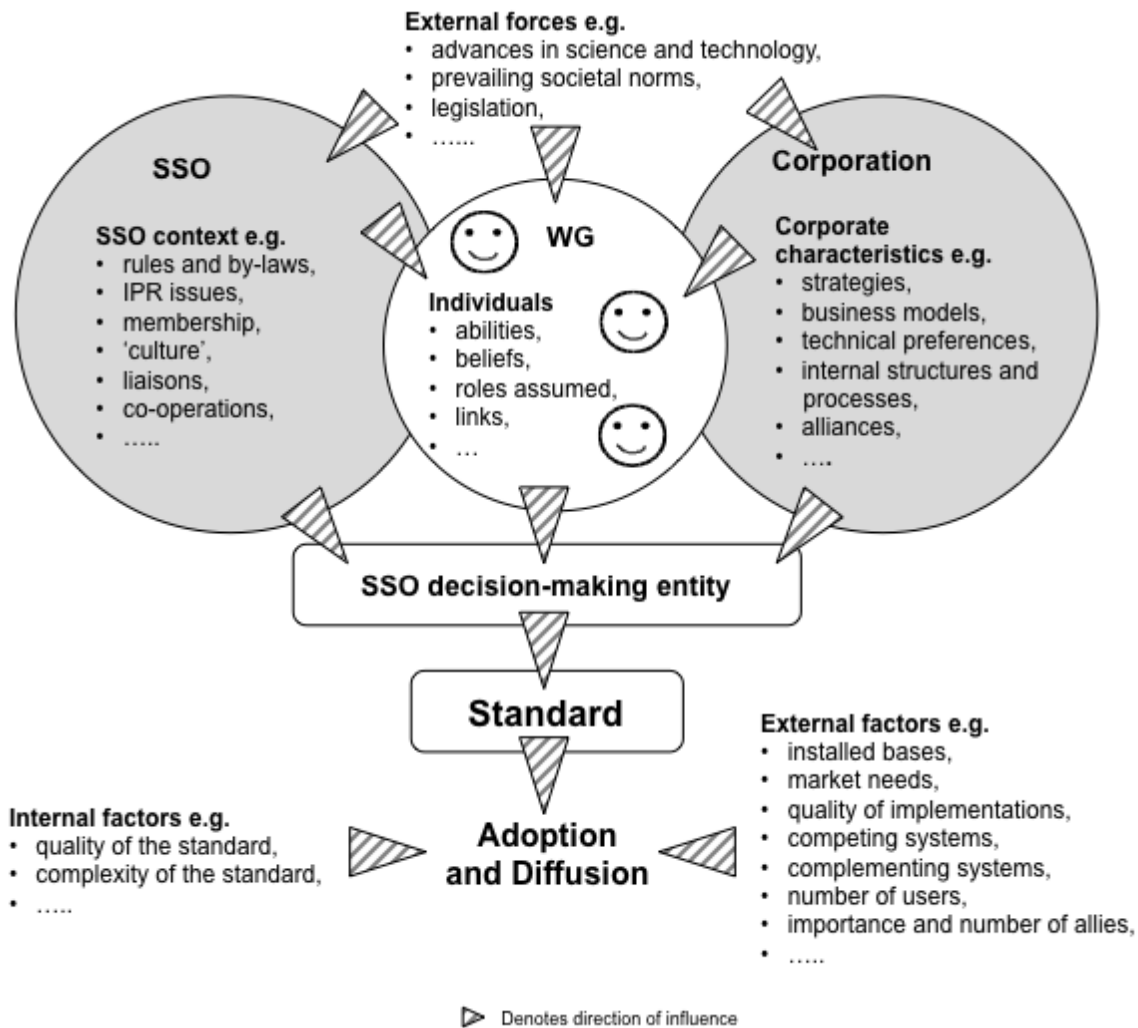

Figure 2: Some Factors That Influence Standards Development

THE CASE STUDIES

The cases cover three companies of different sizes, fields of activity and geographical origin that are active in a number of SSOs. Specifically, the cases look at

- a small European SME active within ISO in the field of compilers and operating systems (OSComp),

- a European manufacturer of chip for wireless communication systems, active in IEEE and the Bluetooth SIG (CDD).
- a large Chinese telecommunication equipment manufacturer with activities in ITU-T, 3GPP and IETF (CTM).

Despite the apparent differences a number of aspects could be identified that had been of relevance in at least two cases. Together with the findings from the literature review these common characteristics led to the identification of some general managerial implications and a number of specific recommendations.

DISCUSSION

In the following, some findings from the case studies will be discussed in the context of insights from the literature. The discussion will focus on those aspects that appear prominently in at least two cases and thus suggest the need for some further analysis.

Two important and related boundary conditions that are common to all standards that feature in the case studies should be pointed out up-front, as they will help explain some observations. For one, no patent statement and licensing declaration form have been registered so far with ETSI (for 3GPP), ISO or ITU for any of the standards. IPR is not normally an issue for the Bluetooth SIG, where every member agrees to license for free any patent rights they have that apply to an Adopted Bluetooth Specification (Reasonable And Non-Discriminatory Zero royalty; RANDZ) to anyone who proves that they are interoperable via standard Qualification tests. The situation with IEEE is again slightly different; the standard in question there (802.11) has lots of associated IP. However, as the activity under study focussed on maintenance work, IP issues have not occurred so far.

The second relevant point is that all standards operate in fairly mature areas. Accordingly, the modifications and additions that are developed (almost) exclusively serve to adapt and (incrementally) extend the functionalities of the existing protocols to the ongoing changes in the environment within which they are supposed to function¹.

- On the Importance of Invested Efforts and Enthusiasm. Two cases highlight the importance of the efforts both a company and its representative are prepared to invest not just into a specific standardisation activity, but into standardisation in general. To be successful, continuous participation, ideally by the same people, is essential. The theory of social capital highlights the

¹ The ITU-T H.248 Recommendation, for example, was first published in 2000; the first version of the ISO 9899 standard for the C programming language dates back to 1990.

importance of such networks in standards setting (see e.g. [Grundström & Wilkinson, 2004]). Specifically, such networks are crucial when it comes to informal discussions, deal-striking and compromise-finding before a vote or a crucial meeting. Along the same lines, Dokko & Rosenkopf [2010] note that long-serving and well-connected individuals are much better positioned to successfully conduct political actions. As a consequence, any newcomer will only have very limited influence on the process without such a network. Two companies also stress the need to 'care' about standardisation and the emerging standard. However, if this is combined with a certain altruism and/or strong own technical views WG members may ignore their respective employer's direct commercial interests (if any, that is) and, ultimately, even work against them.

- **On the Ambivalent Role of the Chairman.** The literature frequently observes that those with a leading formal role in standardisation are highly important for the success of the process [Spring et al. 1995], [Updegrave 2007]. Holding such a role may also be of relevance for companies – chairing a Technical Committee, for example, may well help influence the process at the strategic level [Isaak, 2006]. However, the insights from the case studies paint a slightly different picture. The chairperson is supposed to act in a neutral and impartial role. This implies that s/he must not adopt or favour any national or company positions. Any employee who assumes the role of a chairperson will not be available to support his/her employer's interests (at least not openly). Whether or not the opportunity to steer (or delay or speed-up) the process outweighs this loss will probably need to be considered on a case by case basis.
- **Standardisation as a Marketing Tool.** Leadership in standardisation is well noticed by other companies active in the same sector. Thus, such leadership may well be used by companies to send positive signals ('innovative', 'industry leader', 'technically advanced', see e.g. [Cargill & Bolin, 2007]). CTM are more than keen to forge good relations with peers in standards setting. Such new relations are indeed viewed as a major success of the company's activities within the ITU. Quite similarly, the desire to be seen as knowledgeable and influential in the standards world by their customers is one of the main motivations behind OSComp's active involvement in the process. Both companies belong to the 'disadvantaged' stakeholders in ICT standardisation. CTM 'suffers' from its Chinese origin and SMEs are frequently disadvantaged due to their insufficient resources. For such companies the importance of the marketing aspect may be assumed to be much higher than for well-established multi-nationals from e.g. Europe or the US.
- **On the Different Definitions of 'Success'.** In the literature success in standards setting is typically discussed in relation to standards wars (e.g. [Stango, 2004]) or the level of adoption of a newly standardised technology (e.g. [Pelkmans, 2001]). Neither of these situation applies in the cases

where the respective definitions of success are rather mundane. Both OSComp and CDD consider 'customer satisfaction' as their main success criterion. The purely 'technical' success, i.e. a final standard that meets their needs is not considered an end in itself but a means to the end of having satisfied customers. CTM, in contrast, is somewhat unclear in this respect. On the one hand, they apply purely quantitative criteria like e.g. the number of contribution submitted to SSOs and the success rate of those contributions or the number of leadership positions. On the other hand, one individual activity discussed in the case study was said to be successful based on highly strategic reasons (good support from other vendors and some regulators). In any case, both measures leave out one crucial factor – the customer. Having prevented or significantly delayed the emergence of a standard may also be seen as a success. OSComp and CDD have done so, albeit following different approaches. However, both agree that this can only be done so often.

- On Success Factors. The literature on success factors in the field of standardisation is rather thin on the ground. V.d. Kaa et al. [2011] look at those relevant in standards wars, Wurster [2012] focuses on the success of a standardisation activity from an SSO's point of view and de Vries et al. [2006] look at best practice in company internal standardisation. Unfortunately, to the author's best knowledge literature on success factors in standards setting from a corporate point of view is non-existing. The success factors identified by the case companies are as varied as are their definitions of 'success'. For OSComp, technical competency was the core success factor. In their very technically oriented WG only technically superior proposals will prevail. For CDD, success is measured in terms of the degree to which they could offer their customers what they wanted, in a timely way. Accordingly, success factor number one is to have the necessary manpower to have a prototype ready upon completion of the standard. CTM's somewhat ambiguous measures of success are reflected in the identified success factors. Good technical arguments are certainly helpful for the more quantitatively oriented success factors (like having a proposal accepted). In one case effective communication between CTM delegates well may have been a decisive factor. And finally, a positive attitude is certainly useful for a company that wants to be seen as 'positive'. However, there does not seem to be a clear match between these success factors and the criteria for success. This is in contrast to the other two cases, where the match is pretty good.

GENERAL MANAGERIAL IMPLICATIONS

A number of more general managerial implications of the ongoing developments in ICT standards setting may be identified. It is highly likely that these implications will be very real throughout the remainder of this decade (and beyond).

First and foremost, it is safe to say that the importance of standards and, accordingly, that of standardisation will increase. This holds for both the policy and the corporate level. Accordingly, the importance of corporate standardisation management will also increase. From a managerial perspective, important tasks include:

- Close observance of relevant converging technologies and of emerging fields of standardisation.
- Identification of any relevant standardisation activities to either join or launch.
- Establishment of close links between R&D and standardisation and identification of potential standardisation opportunities as outcome of R&D.

It is essential that these activities support, and are aligned with, the overall business strategy for the sector in question.

The increased relevance of ICT consortium standards in Europe and the rise of new major players such as China in international standards setting will imply the need for:

- More standardisation staff. To be able to contribute to (and/or observe) the increased number of (potentially) relevant standardisation activities.
- Better trained standardisation staff. Asian countries (most notably China and Korea) have long recognised the importance of education about standardisation. Many/most standards setters from these countries are now well-trained and educated. To maintain a level playing field similar educational and training levels need to be attained for Europeans as well.
- Multi-disciplinary teams. Typically, (ICT) standards are developed by working groups comprising mostly engineers and computer scientists. For converging technologies, such 'mono-disciplinarity' will be inadequate. Accordingly, in many such cases a company will need to send multi-disciplinary teams of standards-setters to WG meetings in order to be able to adequately address the technical challenges.

CONCRETE RECOMMENDATIONS

A number of recommendations can be derived from the above.

- Take Standardisation Serious. This implies a high level of strategic thinking, a clear vision what to achieve and the provision of adequate funding.

- Have Clear Goals for Your Involvement. Ask yourself: “What do I want to achieve through this activity?” “What would ‘success’ mean?”
- Do Not Oppose Too Frequently. Trying to prevent the emergence of an unwanted standard should not be done too often as it may well turn out to be counterproductive
- Think Carefully About the Pros and Cons of Formal Leadership Positions. A formal leadership role gives you some leeway in shaping, accelerating or delaying a standard. On the other hand, such roles commit to neutrality.
- Consider ‘Cultural’ Aspects. SSOs differ in terms of culture. Likewise, corporate cultures differ. Try and match the two.
- Think About the People. A delegate’s desirable capabilities and characteristics depend on the type of technology to be standardised. In highly specialised technical fields technical expertise will be more important than presentation skills. At a more strategic level the latter will become more important, along with diplomatic skills. Moreover, make sure that your representatives know which position to adopt.
- Remember That Standardisation is More Than Just Setting a Standard. Standardisation does not begin with the formation of a Working Group – requirements elicitation, research and perhaps some development work precede it, implementation, integration and perhaps marketing follow.

SEGMENTATION BASED ON EVALUATION OF A CLUBBING DESTINATION: AYIA NAPA

Kamenidou, Irene¹; Mamalis, Spyridon¹; Priporas, Constantinos-Vasilios²

¹Department of Business Administration, School of Business and Economics, East Macedonia and Thrace Institute of Technology (EMaTTech), Kavala, Greece

²Department of Marketing, Branding and Tourism, Middlesex University, London, UK

ABSTRACT

This study explored how 358 British tourists' evaluated Ayia Napa, Cyprus' as a destination. Data was collected using an aided self-administrated questionnaire and personal interviews. Analysis included descriptive statistics (frequencies, percentages and means), reliability, factor, and K-means cluster analysis. The evaluation ratings by British tourists regarding the 23 destination image variables were exploratory factor analyzed for data reduction, producing 4 factors and accounting for 73.4% of total variance. Segmentation based on the four factors and overall satisfaction, intention to revisit and recommendation to others, produced 3 segments with N=148 and N=162 and N=48 tourists respectively and with Final Cluster Centers ranging from 2.52 to 4.72. Anova revealed that the three segments were distinctly different for each factor/ variable. This research contributes to the theoretical and practical improvement of Ayia Napa, by investigating tourists' evaluation of clubbing destination attributes, overall satisfaction, intention to revisit and intention to recommend. The results of the analysis reveal variations in the level of visitors' evaluation and satisfaction. These results can be used as basis to help improve customer satisfaction, and help ensure that Ayia Napa maintains its image in the future.

Keywords: *Evaluation, clubbing destination, destination image, Cyprus, marketing*

INTRODUCTION

Worldwide the tourism industry is considered as one of the most important economic forces, generating profits, work possibilities and business expansion (WTTC, 2015). These are extremely important for a country's economy as well as for citizens' welfare in the case where the country is undergoing an economic crisis (Jucana and Jucana, 2013) such as Cyprus. Countries undergoing an economic crisis are interested in developing a positive image for their destinations in order to increase the benefits of tourism. A destination's image, as perceived by the actual and potential tourists, plays

an important role in determining its competitiveness as a tourist destination. According to Hunt (1975) a destination's image influences a tourist's decision-making process when he/she considers alternatives destinations. Moreover, the intensified competition among different destination areas, increases marketers concern for repeat visitation by previous travelers. Thus, it is very important from a marketing perspective that the tourist authorities in a destination area identify how visitors evaluate their experience in this area (Arbogast and Maumbe, 2014).

There is abundant research regarding different aspects of tourism in Cyprus (e.g. Farmaki, 2012; Farmaki and Papatheodorou, 2015; Koutra and Karyopoulou, 2013; Louca, 2011; Sharpley, 2001; Ziakas and Boukas, 2013). Additionally, there is a considerable research on British tourists and their evaluation of, and satisfaction with, a tourist destination - not all of these refer to Cyprus (e.g. Audreu *et al.*, 2000; Calafat *et al.*, 2013; Clerides *et al.*, 2009; Ekinici *et al.*, 2003; Kamenidou *et al.*, 2009, 2013; Kozak, 2002).

Taking into account the importance of the tourism sector for Cyprus, as well as for the British tourist market, the purpose of this study is to investigate British tourists' evaluation of Ayia Napa, Cyprus as a clubbing destination. Continuously, an objective is to segment tourists based on their evaluation of the destination image.

This study contributes to the literature on clubbing destinations in the following way. First, previous studies on clubbing destinations, mostly focused on Ibiza and substance use or the risk behavior of tourists (e.g. Bellis *et al.*, 2000, 2004; Briggs and Turner, 2012; Kelly *et al.*, 2014; Lora-Tamayo *et al.*, 2004). Although, Ayia Napa is considered as a very important clubbing destination in the Mediterranean area, studies are limited (Sönmez *et al.*, 2013). Furthermore, there are limited studies on the segment of clubbing destinations. Secondly, there is a scarcity of empirical research on Ayia Napa as a destination (Saveriades, 2000; Sönmez *et al.*, 2013) and none of them focused on the evaluation of the Ayia Napa destination as a clubbing destination based on tourists' perspectives. Thirdly, it is crucial for the area to identify whether or not its visitors are satisfied with their visit to the destination. Satisfaction is considered an evaluation of actual performance and expectations. Tourist satisfaction is created by the comparison of pre-travel expectations and post-travel experiences (Moutinho, 1987). Moreover, the findings can help practitioners and local tourist authorities in their effort to design appropriate positioning strategies for the various segments (Priporas *et al.*, 2014).

TOURISM IN CYPRUS– AYIA NAPA

According to eurofound.europa.eu (2012) Cyprus' service sector dominates the market economy, accounting for nearly four-fifths of GDP. Moreover, trade, IT and tourism-related activities accounted for 27.4% of the GDP in 2011 (Cyprus Statistical Service, 2012). Cyprus's assets are its climate, physical

environment, and archaeological and cultural heritage. In addition, it is usually considered as an inexpensive destination which has had a positive influence on tourism development in the country. International tourism is one of the most dynamic sectors of the Cyprus economy. Specifically, tourism has a very important role in supporting Cyprus's economy. For the years 2013, 2012, 2011 it generated 2.082,4, 1.927,7, and 1.749,3 € million respectively. The annual report of the Cyprus Tourism Organization (CTO, 2013, 2012), shows that tourist arrivals in 2012 increased by 3% compared to 2011. Specifically, 2,464,903 tourists visited Cyprus in 2012 compared with 2,392,223 tourists in 2011. During the same period, the global financial crisis, the aggravation of the financial conditions of Cyprus, as well as the increasingly competitive environment in tourism, did not directly affect Cyprus tourism. On the other hand, for the year 2013, the total tourist arrivals was 2.405.390, bringing a -2.4% compared to 2012. British tourists are the largest tourist market for Cyprus. According to the Statistical Service of the Republic of Cyprus (2014), for the years 2011, 2012, and 2013, the British tourists that visited Cyprus were 1,020,709; 959,459; and 891,233 respectively. Five key tourist districts exist in Cyprus: Paphos, Limassol, Larnaca, Nicosia and Famagusta. Ayia Napa is in Famagusta, at the south east coast of Cyprus, and is a reputable party town and prime site for nightlife (KPMG, 2015). Regarding Ayia Napa and according to the Cyprus Statistic Service, for 2012, Ayia Napa was the second destination in Cyprus with about 18% of total tourist visits, after Pafos and Polis Chrysochous which had 37%. Moreover, The Independent newspaper (2011) in an article regarding Europe's best beach getaways, wrote that Ayia Napa, Cyprus was the number one destination in Europe "based on the most highly rated beach destinations by millions of international travelers in TripAdvisor reviews".

DESTINATION EVALUATION

The evaluation of a destination is a complex process (Weaver *et al.*, 2007) and may be affected by experiences that occurred before a tourist arrives, which are beyond the control of tourism suppliers (Tribe and Snaith, 1998). Evaluation of a destination by tourists is very important since it shows subjectively how tourists actually perceive the specific destination relative to their expectations (Bigne *et al.*, 2001; Chon, 1990; Echtner and Ritchie, 1991). Moreover it relates to tourist satisfaction, since satisfaction is considered an evaluation of actual performance and expectations. Tourist satisfaction results from comparing pre-travel expectations and post-travel experiences (Pizam *et al.*, 1978). Baker and Crompton (2000) assert that "satisfaction is purely experiential. It is a psychological state that can only be derived from interaction with the destination". On the other hand, Klaus (1985, p. 21) states that satisfaction is "the customer's subjective evaluation of a consumption experience" which is based on consumer perceptions and the actual characteristics of the product.

If the outcome of the evaluation is favourable, then travel satisfaction is established (McDowall, 2010; Hill, 1996), which will influence the future travel decisions of individuals (Mathieson and Wall 1982). Moreover, the evaluation of a destination and its attributes has a crucial influence on repeat visitation intentions, recommendations (e.g. Chen and Chen, 2010; Yoon and Uysal, 2005; Matzler *et al.*, 2007) and loyalty (Hui *et al.*, 2007; Oppermann, 2000). Thus, the evaluation of tourist destinations has received considerable research attention (Weaver *et al.*, 2007).

CLUBBING DESTINATIONS

Goulding and Shankar (2011) point out that clubbing emerged in the mid of 1980's as pleasure/hedonic tourism in Ibiza. Hutson (2000) refers to rave parties taking place in Ibiza and that "raves now penetrated to the center of British youth culture", thus becoming one of the supreme cultural phenomena. Today, this special form of tourism attracts millions of young tourists from all over the world to major clubbing and nightlife destinations (e.g. Andriotis, 2010; Kamenidou *et al.*, 2013; Tutenges, 2012). These destinations defined by Sönmez *et al.*, (2013) as "purposefully packaged and aggressively marketed by transnational tour operators [TO] to that segment of youth travelers seeking hedonistic playgrounds that offer unrestrained drinking and round-the-clock partying with others of their own age, a host of activities that permit behaviors unconstrained by social norms at home, and music and dancing to offer a release from customs of the civilized social spaces of daily life" (p. 40).

Although Tutenges (2012) asserts that clubbing and nightlife tourism take place in many locations all over the world, the locations in the Mediterranean basin are considered the most popular. In particular, these areas are located in Spain (Ibiza, Mallorca), Greece (Crete, Corfu, Kos, Rhodes, Zakynthos) and Cyprus (AyiaNapa), while emerging destinations are considered in Bulgaria (Sunny Beach), Slovenia (Izola), Turkey (Alanya, Bodrum, Gümbet, Marmaris), and Egypt (Sharm el Sheikh) (Sönmez *et al.*, 2013).

Previous studies on clubbing destinations (e.g. Andriotis, 2010; Bellis, 2009; Monterrubio *et al.*, 2015; Sönmez *et al.*, 2013) indicated that this kind of tourism involves excessive drinking, drug use, risky sex behaviors and that the consequences are sometimes injuries, accidents, vandalism, fights, assaults, and even deaths.

METHODOLOGY

A self-administered questionnaire was utilized for data collection. The questionnaire used was a modified version of Kamenidou *et al.*, (2013) regarding clubbing destination image. Since the questionnaire of Kamenidou *et al.*, (2013) was for Kavos, Corfu, qualitative follow up research was

undertaken in London from November- December 2013. In depth interviews were employed with 23 British citizens in London, whose age ranged from 18 to 35. All participants had to have visited Ayia Napa as tourists, in order to validate the destination image components of the questionnaire used in the Kavos study, before using it in the field research for Ayia Napa. This resulted in adding 5 more items to the questionnaire regarding the destination image scale. Thus, a total of 23 clubbing destination image components were used in the final questionnaire. It is divided into 3 sections: the first section refers to visitation behaviour, the second regards Ayia Napas' evaluation of the destination image components, and the third refers to the British tourists' socio-economic and demographic characteristics. The scale used for evaluating the clubbing destination image components was adapted from Yoon and Uysal's work (2005). The 5-point evaluation scale was: 1=much worse than I expected, 2 = worse than I expected; 3= neither better/ nor worse than I expected; 4= better than I expected and 5=much better than I expected. British tourists were asked to evaluate each clubbing destination component: Please evaluate each of these items that reflect the clubbing destination image of Ayia Napa, compared to what you expected when visiting Ayia Napa.

The final research took place in London from January to March 2014. The study was aimed at was British citizens who had visited the area of Ayia Napa, Cyprus. Data selection was realized using a convenience and snowball sampling method. In order to participate in the research some criteria were used: the participant had to be a permanent resident of Great Britain and aged up to 35 years old; s/he visited Ayia Napa in the last three years (2011, 2012, and 2013) and had to have stayed at least 3 nights. In total, 358 valid questionnaires were gathered, a satisfactory sample size for the purposes of the research as well as the main statistical analysis utilized (Hair *et al.*, 2010). Data analysis included descriptive, reliability, factor, and K-means cluster analysis.

FINDINGS

Tourists' profile and visitation to Ayia Napa

As to gender, 43.3% of the sample was male and 56.7% were female. Regarding age, 29.6% were up to 20 years old; 30.2% fell in the age range of 21-25; 22.6% were 26-30; and 17.6% were 31-35 years old. Also, 50.8% of the sample was single; 39.1% were married or living together with their partner and 10.1% were divorced or separated. Concerning occupation 37.9% were students; 36.4% were private employees; 14.3% were public employees and 11.4% were businessmen. The participants fell into three categories of education: secondary education (43.8%); college /university degree (51.7%) and 4.5% held a postgraduate degree. Lastly, referring to individual net monthly income, 30.8% up to 1000.00£; 51.2% had from 1000.01-2000.00£ and 18% had a monthly individual income >2000.01£.

Visitation to Ayia Napa

From the sample, 63.7 % had already revisited Ayia Napa and 36.3 % had not been to Ayia Napa before. Of those who had been to Ayia Napa before, 86.0% had been 5 times and 14.0% had been more than 6 times. The main sources of information regarding Ayia Napa were: friends (68.2%), relatives (68.2%), tour operators and their brochures, and the internet (47.1%). In contrast, the Cyprus Tourism Organisation (CTO) does not appear to be a significant source of information about Ayia Napa for tourists, since only 8.5% of the participants had been informed by the CTO.

Tourist evaluation from Ayia Napa's destination image- Factor analysis

Since the questionnaire used in this research included 5 more variables than the one used for Kavos, exploratory factor analysis was employed to all items, in order to investigate the factors that this questionnaire derived and to use these factors as new variables for segmentation analysis. Thus, the 23 image components of Ayia Napa were factor analyzed with Principle Component Analysis (PCA) with varimax rotation for variable reduction (Table 1). Items with factor loadings <0.50 were detained. For the factor analysis, the indicators Kaiser-Meyer-Olkin measure of sampling (KMO), Bartlett Test of Sphericity (BTS) and Significance (p) are presented, which are indicators of competence implementation of the Principal Component Analysis model (Hair *et al.*, 2010). Four factors derived (K.M.O.= 0.905; B.T.S.=8184,048; df=253; p= 0.00) accounting for 74.3% of the Total Variance (T.V.), with total reliability of the scale, $\alpha=0.9157$. The factor's name, the T.V. explained, its Mean Factor Score (MFS), the Cronbach α of each factor, as well as the communality (COM) and the Mean Score (MS) of each item is also presented.

Factors	Destination components	Factor loading	COM	MS
<i>Factor 1:</i> Wild destination 25.6% of T.V*. MFS=4.15 (0.67) Cronbach $\alpha=0.942$	Liberate alcohol consumption/ bar crawls	0.879	0.896	4.17

	Water sport facilities	0.614	0.661	3.94
	Good climate/ pleasure weather	0.579	0.679	3.87

Table 1: Evaluation factors of Ayia Napa destination

Factor 1 was named “Wild destination”, because its items were associated with aspects of living wild without boundaries, and with factor loadings ranging from 0.646-0.879. Factor 2 was labelled “Money for value and personal safety”, because it encompassed the five items referring to “money and prices” and one item regarding the personal safety of visitors; and with factor loadings ranging from 0.700-0.833. Factor 3 was named “Infrastructure” since it included items associated with the general concept of infrastructure (e.g. accommodation, hygiene, food, etc) and with factor loadings ranging from 0.699-0.809. Lastly, Factor 4 was named “Sea and Sun destination” since it included items associated with the general concept of a classic sea and sun destination and with factor loadings ranging from 0.579-0.784.

Cluster analysis

Segmentation of the tourist sample via cluster analysis was employed based on the four- factor dimension of destination image evaluation of Ayia Napa. In the segmentation analysis 3 additional variables were added: overall satisfaction; intention to revisit, and intention to recommend. Regarding overall satisfaction results revealed that tourists were satisfied (MS=4.14), with a probability to revisit (MS=4.38) and to recommend (MS=4.37). The analysis resulted in a three cluster solution. Multivariate statistics indicated statistical significances difference between the three clusters, where all factors contributed to differentiate the tourist clusters. Each segment's Final Cluster Centers (FCC), the sample size, and ANOVA statistics test results are presented in Table 2.

Evaluation Factors Satisfaction, Revisit, Recommendation	1 st cluster, n=148	2 nd cluster, n=162	3 rd cluster, n=48	ANOVA Statistics	
				F	Sig.
<i>Factor 1: Wild destination</i>	3.63	4.62	4.21	152.970	0.000
<i>Factor 2: Money for value and personal safety</i>	3.42	4.44	3.84	149.568	0.000
<i>Factor 3: Infrastructure</i>	3.26	4.17	3.97	120.720	0.000
<i>Factor 4: Sea and Sun destination</i>	3.30	4.38	3.54	185.919	0.000
Overall satisfaction	4.38	4.72	3.25	137.486	0.000
Probability to revisit	4.15	4.62	2.52	199.260	0.000
Probability to recommend	4.30	4.72	3.42	122.200	0.000

Table 2. Cluster analysis based on tourist's evaluation of Ayia Napa as a clubbing destination and overall satisfaction, intention to revisit and to recommend

The three segments obtained via K-means cluster analysis were:

Cluster I: The well informed, who are satisfied and will probably revisit and recommend the location. The first cluster represents 41.3% of the sample. This segment has its FCC for the evaluation factors from 3.26-3.63. This segment is either well informed or very rational in terms of their expectations and outcomes. In the first situation, it is well informed about what it was going to find in Ayia Napa, and thus no surprises arose. If this is the case, this segment had probably visited Ayia Napa previously and knew what to expect, given that they had firsthand experience. In the second situation, it is a very rational segment, in the sense that they found what they had probably heard or read they were going to find in Ayia Napa. And thus, the outcome of their clubbing experience was roughly as they expected, not worse, but neither better, meaning their expectations were not "far away" from the visitation outcome. This cluster is satisfied, and has a high probability of revisiting and recommending Ayia Napa as a clubbing destination.

Cluster II: The Enthusiastic. The second cluster represents 42.3% of the total sample. This is the segment that evaluated all factors at least better than expected (FCC=4.17-4.62). Moreover, the first factor "Wild destination", has the highest rating - tending to be much better than expected. This segment is also overall very satisfied, and has a high probability of revisiting and recommending Ayia Napa as a clubbing destination.

Cluster III: The Conservatives (positively evaluate, neutrally satisfied, probably will not revisit but probably recommend). The third cluster represents 13.4% of the total sample size. This segment has FCC for the evaluation variables tending to be better than expected (FCC: >3.51-4.21). Even though the tourists in this segment found Ayia Napa better than expected as a clubbing destination, they are

overall neither satisfied nor dissatisfied. They have the lowest satisfaction level compared to all three segments, and it is unlikely they will repeat their visit (FCC= 2.52). Also, their probability of recommending Ayia Napa as a clubbing destination is quite low (FCC= 3.42). This could be due to two things: they are the older of the total sample, are potentially more conservative, and may not wish to share or discuss the private experiences they had there (what happens in Ayia Napa stays in Ayia Napa). Alternatively, there may be other factors that contributed to their dissatisfaction that were not studied in this research.

DISCUSSION-CONCLUSION

This main scope of this study was to investigate how British tourists' evaluate Ayia Napa, Cyprus as a clubbing destination. This was realized via primary research which took place in London, UK and had as a sample British citizens who had visited Ayia Napa Cyprus during the last three years, i.e. the years 2011-2013 and with an age ranging from 18-35. Results revealed that the item with the highest evaluation score was "Festivities and Events" (MS=4.37), where the sample considered it 'much better than expected'. On the other hand, the lowest Mean Score was for the item "Nice and clean beaches" (MS=3.64), where the sample evaluated it as 'expected' with a tendency towards 'better than expected'. This can be considered as logical, since there is extensive advertising about the 14 blue flags that the beaches of Ayia Napa hold, which contributes to them being considered among the best in the Mediterranean.

An objective was to segment tourists based on their destination image evaluation, overall satisfaction, and probability to revisit and to recommend. In order to reduce the evaluation variables for segmentation analysis, factor analysis with varimax rotation was employed, resulting to a 4- factor solution. Namely: Wild destination, Money for value, Infrastructure, and Sea and Sun destination. These factors are closely related to the factors that derived from Kamenidou et al. (2013) study, varying in items per factor in the 2-4 factors.

Segmentation resulted in a three cluster solution. A closer though look at the clusters derived, shows that a small segment, even though they evaluated Ayia Napa quite high as a clubbing destination, was not satisfied, and do not intend to revisit or recommend this destination. Based on these findings the local authorities should design suitable strategies for each segment and particular for the one that seems to be less satisfied with the experience. At a theoretical level, this study extends the body of knowledge about clubbing destinations by measuring and evaluating factors other than risk, drugs, and alcohol, as the wide body of literature for clubbing destination does.

Limitations-recommendations for future research

The findings of this study are valuable to the Cypriot government, the tourism agencies, and the local authorities of Ayia Napa. Ayia Napa has changed from being a small rural fisherman town (Spanou, 2007) to being a cosmopolitan clubbing destination.

Even though there was an attempt to minimize limitations when designing this research, some still exist and need to be mentioned. These limitations are the ones guiding the specific needs of, and for, future research. First of all, the outcomes of this study may not have represented all tourist nationalities visiting Ayia Napa, since it is focused only on British tourists. Furthermore, the study was not conducted in Cyprus but in the UK and was limited to London, due to economic and time restraints. This results in particularisation of the findings to British tourists who visit Ayia Napa. This also means that participants were not responding based on their immediate experience of the clubbing destination

THE CRITICAL ROLE OF PRODUCTION TECHNOLOGIES FOR WOOD AND FURNITURE KNOWLEDGE-INTENSIVE FIRMS

Karagouni, Glykeria

Technological Educational Institute of Thessaly, Larissa and National Technical University of Athens,
Greece

ABSTRACT

The paper explores the exact role and significance of production technologies in the creation of competitive advantage, the survival and the innovative performance of low-tech but knowledge-intensive new ventures focusing on cases of the Wood and Furniture (W&F) Industry. The choice of production technologies constitutes a significant strategic decision at the venturing stage as well as at stages of reconfiguration. On the other hand, production technologies have been claimed to be quite significant in low-tech innovations. For that purpose, an exploratory case-study research design was selected engaging three information-rich W&F cases. Research findings indicate that Greek wood and furniture new ventures prefer to invest in production technology innovation in order to secure a position within mature and saturated markets. Technologies are developed as accumulation of various pieces of knowledge sources out of the strict sectoral limits, selected to fulfill conditions and limitations of the initial business idea and combined in novel ways ending up even with machinery innovation. The entrepreneurs interact with a wide range of stakeholders all along the value chain, of both low- and high-tech industries and at global level. However, machine manufacturers and raw material providers are the most important links. In all three cases, the introductory innovation and competitive advantage are based on production technologies' novelties which enable the firms to capture high-value markets for growth. The results strengthen our assumption on the role of production technologies for LT-KIE more generally. Production technologies affect the firms' strategies and support dynamic processes of sustaining the competitive advantages. The study verifies the emerging aspects on the innovation ability and the significant role of knowledge bases in low-tech industries as well as the interdependence between product and process innovation in mature industries. It also seems to contradict the common belief that low-tech companies are just "buyers of embodied technologies"; entrepreneurs appear to co-operate for the development of novel machinery, equipment or even novel processes.

Keywords: *production technologies, Wood and Furniture industry, knowledge-intensive firms, innovation, low-tech, new venture*

INTRODUCTION

The paper argues that production technologies' choice or development plays an important role in low-tech but knowledge-intensive venturing. Production technologies and more generally, the management of new technologies are lately receiving increasing attention in strategic management research either as important factor of innovative efforts and firm performance or as core elements of technological capabilities .

On the other hand, literature on low-tech but knowledge-intensive entrepreneurship (LT-KIE) has so far highlighted the necessity of knowledge-based innovation for the beginning of viable low-tech but knowledge-intensive ventures. Furthermore, it has also been discussed that all types of low-tech innovations include - to a greater or lesser extent - novelties in production technology which can be incremental or radical (Hirsch-Kreinsen and Schwinge, 2011).

However, theoretical and empirical work providing evidence on the exact role and significance of production technologies in the survival and innovative performance of LT-KI ventures is still at a rather embryonic stage. The paper takes up the challenge to examine the impact of decisions and their implementation regarding production technologies on a new LT-KI ventures course using a multiple case study research design. In doing so, it adds to the scarce existing theoretical efforts and, most interestingly, provides useful empirical evidence on how LT-KI firms (and more precisely W&F new firms) use production technologies to effectively develop competitive advantages and differentiate in a changing environment.

Our findings suggest that W&F KI firms turn to innovative technologies and machinery in order to incorporate novelty and develop technological capabilities to achieve differentiation. Production technologies are results of co-development covering technologies and knowledge from a significantly varied range. Especially during establishment, the output of innovation constitutes the initial competitive advantage. However, knowledge plays a pivotal role; planning and installing the suitable production technology entails a great amount of trans-sectoral knowledge combination. Further investments in technology enhance the firm's innovativeness and performance, by sustaining new firms' competitive advantage.

The paper begins with a theoretical discussion of production technologies and low-tech, knowledge-intensive entrepreneurship, giving emphasis on how these two research strands can be related and complements each other focusing in Wood and Furniture industry. In the third section it presents the

research design and introduces the experimental setting. It then documents the empirical results and ends with discussion of the major findings and the concluding remarks.

THEORETICAL BACKGROUND

2.1. Production technologies and low-tech knowledge-intensive entrepreneurship

In 1972, Rosenberg defined technology as “those tools, devices, and knowledge that mediate between inputs and outputs (process technology) and/or create new products or services (product technology)”. Almost forty years later, Dosi and Grazzi (2010) claim that technology “entails procedures regarding how to achieve the ends concerned, particular bits of knowledge, artifacts and specific physical inputs necessary to yield the desired outcomes”. Technology was related to pieces of knowledge associated with technologies, and processes and derived from an extremely varied range which had to be combined in creative ways to introduce novelties, becoming more than knowing about “such things as tools and machines” (Bell, 1973).

Consequently, technological knowledge and technology were interwoven with innovation; Arnold and Thuriaux (1997) claim that economists tend to describe innovation as “a new combination of the factors of production” according to the Schumpeterian perspective. This can involve using results of scientific or technological research, but it can also involve much more mundane things such as laying out the machines on the factory floor in a better order or copying ideas from a producer in a distant market in order to create a local advantage.

Production technologies and more generally, the management of new technologies are lately receiving increasing attention in strategic management research either as important factor of innovative efforts and firm performance or as core elements of technological capabilities (Greve, 2009; Lall, 1992). Many scholars have argued on the positive impact of the development of technology on firms’ performance (Meliciani, 2000) as well as the usual high costs related to it (Vranakis and Chatzoglou, 2012). Therefore, the choice of production technologies constitutes a significant strategic decision at the venturing stage as well as at stages of reconfiguration. The implementation of such investments is critical for a company for its future success and survival (Vranakis and Chatzoglou, 2012). Technology evolves in certain path dependent ways while technological progress “builds on what went before” (Teece, 1996, p.195), indicating that it usually has significant organization-specific dimensions.

Low-tech industries have been traditionally thought to be well-established with technological norms, methods and leitmotifs to exist for many generations. Scholars argue on rather standard processes and products at an advanced stage, lacking the prevailing technological contingency of high-technology undertakings. Low-tech industries are generally confronted as “borrowers” of technology which may come from other sectors such as machinery, ICT and raw material producers (Hirsch-Kreinsen and

Schwinge, 2011). Besides the skepticism of low-tech dynamism and innovation potential, there is a growing stream of literature which posits that cases of conscious application of knowledge in innovation efforts are to be found within low-tech sectors too (Hirsch-Kreinsen and Schwinge, 2011; Karagouni et al., 2012). In such cases, advanced production technologies enable “the firm to capture lucrative and more value added markets for growth” (Evers, 2011).

Furthermore, according to Smith (2000) “knowledge cannot be incorporated into production except via investment, and the function of investment is often to implement new knowledge in production technology”. Much of the knowledge intensity enters then as embodied knowledge incorporated into machinery, equipment, methods, techniques and production processes or as intermediate inputs such as components and materials. Activities such as design, customization, the installation and preparation of equipment and trial production are knowledge-generating activities.

Thus, the nature of knowledge upon which technological activities draw is multifarious regarding types of knowledge bases and skills and the ways they are used and applied in order to transform a concept into products and processes (Granstrand, 2000). In LT-KIE cases, “Embodied flows involve knowledge incorporated in to machinery and equipment” (Hirsch-Kreinsen and Schwinge, 2011). The basis of them and of trans-sectoral sources of knowledge is the fact that more research-intensive industries (such as the advanced materials sector or the ICT) develop products that are used within other industries: that is machines and equipment or components and materials. However, the technology provider and passive user relationship seems to constitute a major characteristic of the transfer from the old-type conventional low-tech industry to the new *non-passive type* of low-tech firms. In literature there are a number of papers narrating the dominance of a few powerful, scientifically sophisticated equipment makers who ultimately controlled the advances and innovation in whole industrial sectors such as textiles and dairy industry (e.g. Lundvall, 1988).

Although most traditional sectors are still supplier-dominated (Hirsch-Kreinsen and Schwinge, 2011), this phenomenon is gradually changing through the adaptation of open innovation models and the development of common research projects. The new model of co-operation imposes certain changes in all industries included. Actually, knowledge and technological solutions tend to permeate through *sectoral boundaries with* special links and interaction with machine manufacturers, technology, raw material and complementary asset suppliers. Such co-operations become crucial particularly if technical equipment is custom designed, or if at least certain components and functions are adapted to the particular user needs. Many times LT-KIE actors decide even to produce their own complex machinery in-house in order to protect proprietary process technologies that constitute a significant part of the firm’s competitive advantage. However, it seems that production technologies constitute the media through which high-tech industries develop co-operations with low-tech ones with mutual

benefits such as the exchange of knowledge, common R&D and even the mutual progress of firms and sectors within a dynamic- interactive supplier-customer framework.

Production technologies and manufacturing capabilities appear further to play a significant role further in the commercialization of the innovative output; agents have to develop the necessary manufacturing systems to develop complex designs. Manufacturing capabilities, therefore, can determine the initial survival and success of a new venture or the success of consequent innovations (Pisano & Wheelwright, 1995).

2.2 Wood and Furniture Sector

Wood and furniture industry is one of the most representative traditional low-tech industries worldwide with a significant share of employment and value-added for the global manufacturing industry and economy.

The wood product manufacturing industries or woodworking industries include the production of sawn wood, wood-based panels, joinery and carpentry materials, containers packaging and other wooden articles. The furniture industry is part of the down-stream value chain activities of this sector including other material as well. It is essentially an assembling industry, which employs various raw materials ranging from wood and wood-based panels to metals, plastics, textile, leather and glass. There are many different types of furniture with very different uses.

Woodworking companies are considered highly innovative and knowledge-intensive (Smith, 2008); they build high-quality innovation systems regarding mainly production technologies which result in both novel products and processes. Sectoral research and technological development knowledge centers, global machinery manufacturers, suppliers, the chemical industry, and Universities develop synergies with firms of the sub-sector. Innovations turn around engineered wood products, wooden composites, novel fittings and other wooden products or issues such as productivity increase and quality improvement.

Furniture companies are less innovative regarding technical innovation. Knowledge evolves mainly around aesthetic, design and fashion related issues and focuses on creativity and strong image building. Yet, process and product innovation is evident in the undertaking of lengthy processes of restructuring and modernization, development of sustainable production methods and novel business models (e.g. modular design). Major factors of competitiveness for the sector consist of research and innovation along the whole value chain and mainly material and fittings, skills and quality, design and added value, knowledge and know-how, together with better access to third country markets.

METHODOLOGY

A multiple exploratory case study research design was selected (Yin, 2003) in order to explore the ways production technologies affect the new venture creation and survival with the individual low-tech company as the unit of analysis. In fact, three information-rich W&F cases were chosen which fulfilled the KIE definition (Malerba and McKelvey, 2010) satisfying the following criteria:

- Knowledge-Intensive venture creation among 1998–2007
- Evidence of being assigned to the most innovative companies in the market or product field through knowledge-seeking activities.

The studies covered the life of the firms since establishment up to 2013 which coincides with the middle of the most severe economic crisis in Greece. All three are small enterprises covering different W&F sub-sectors. They further share a common characteristic: all three abandoned the conventional family business and started their own *knowledge-intensive* company in the same sub-sector as the family business. On the other side, they were chosen to represent venturing under different environmental conditions (such as technological, market-related and economical). WF3 was actually established at times of prosperity at sectoral and national level, while WF1 was born just on the threshold of the severe socioeconomic crisis.

The data gathering took place in face-to-face, in-depth interviews with entrepreneurs and key personnel using a semi-structured questionnaire. Additional sources of information were also used to complement the interview data such as plant visits, company reports, awards and company websites. Table 1 describes the three cases explored in this study.

Table 1: Description of case data

	WF1	WF2	WF3
Foundation year	2007	2003	1998
Employees in 2013	10	11	30
duct family	Veneer stitching, marquetry inlays	Wood processing, glue-laminated products	Kitchen and wardrobe
Sub-sector	Wooden products, services	Sawn wood	Furniture
Main functional parameter affected	quality	Quality - productivity	Functionality
% of sales in national/international markets	90% /10%	100%/0%	100%/0%
Main areas of innovation impacting production technologies	Process / supplier	Product / R&D	Machine and material supplier
Patents	no	yes	yes– exploited by the machine maker
Other Stakeholders involved	yes	yes	yes
Average annual sales growth rate since establishment and up to 2012	33,8%	22%	17,3%

4. FINDINGS

WF1-case

WF1's entrepreneur left the family business due to the existence of many descendants. Veneer production was a business he knew very well; however, he did not want to become a direct competitor of his family. His deep knowledge and experience of the relevant processes drove him to "create" a niche market by questioning the raw surface of veneers under the common acceptance that it is a natural deficiency, since veneers are natural products. The targeted *veneer surfacing uniformity* generated multiple problems because there was no relevant technological approach by then. The entrepreneur transcended sectoral and national limits, in order to co-create the necessary production technologies collecting knowledge and co-creating value with machine, equipment and material producers in Germany, Austria, Italy and Spain. He actually collaborated with the technical departments of the manufacturers in order to achieve the desired machine and equipment characteristics, and a high degree of flexibility. He also collaborated with raw material producers to co-produce raw material of specific features and level of quality in order to suit the novel technology. Since then, WF1 engages open innovation continuing and deepening the co-operations developed at the founding process and mainly the suppliers in Italy and Spain. There is also a constant co-operation with a non-direct competitor in Germany on eco-friendly process novelties in order to serve different market niches. In all efforts there is a substantial amount of knowledge flows through long-lasting relationships, interactive learning and knowledge management, making West Europe a wide "knowledge neighborhood". The unique, flexible and high-level technologies allowed for the development of exporting capabilities in 2009. In 2010 and 2011, the company starts offering turnkey solutions being engaged in big architecture projects in Greece and abroad. In 2013 it can still fight crisis co-operating with high-value furniture producers.

Production technologies constitute the basis for innovative techniques, innovations on quality surface, creative NPD combined to eco-friendliness and flexibility in design and batch sizes. WF1 refused the rather easy well-worn, traditional low-cost path, which is too familiar in low-tech industries; it built on novel production technologies and created a new niche market in the Greek market as its initial competitive advantage. The constant differentiation against European similar products by adding quality and innovation characteristics, the expansion of novelties and areas of applications and the potential for flexible batches sustain the competitive advantage and keep WF1 among the pioneers at least at European level. The firm presents a satisfactory sales rate although within the crisis. There are still no direct competitors in Greece.

WF2-case

A fire at the family wood-processing plant drove the three brothers to seek innovation and flexibility in their effort to create a survivable business. Their efforts to establish the new business were multifaceted and spread in many areas such as production processes, quality, NPD, design, energy and ecology. The initial competitive advantage was the introduction of innovative cutting-edge sawing technology that enabled more flexibility and quality while it advanced efficiency and added capabilities for innovative products and penetration in niche high-value markets. The entrepreneurs added their own novelties in some parts of the equipment in collaboration with the manufacturers. On the basis of the new production processes they sought differentiation and applied innovative ideas which alone would not be accomplishable.

They invested in combinations of innovative products and technologies targeting ecology and design aspects. However, they needed new knowledge; in 2005-2006 they entered a Knowledge-cluster research project to work on three-part glue-laminated wood products with trapezoidal particles; this constitutes a radical innovation at least at European level. Experimentation and control tests are run in the National Technical Department of Wood and Furniture technology laboratories. In parallel, they develop a novel idea on limited production of special decorative parts of recycling wood material. In 2007 they focus again on production technologies to increase productivity and the ability for in-house innovation on technical parameters and specifically saw geometrical characteristics. The research was once again supported by the relevant National Technological Department. In the same vein, they devote 2008 in excelling quality while since 2009 research focuses on production parameterization, traceability, certification and “green” energy. According to the entrepreneurs, novel products are the result of the ability to combine creatively design, cutting-edge technology and the know-how of producing a large variety of glue-laminated products.

The case highlights the focal role of knowledge and innovation at the extremely traditional timber sub-sector. But for knowledge and innovation, the plant would be “a conventional sawn-mill condemned to death” (experts' opinion, heard in “Building with wood” seminar, 2010, Thessaloniki, Greece).

WF2 created a strong initial competitive advantage regarding mostly technical innovation and exploiting the growing trend towards quality and ecology as well as the turn to innovative but ecologic composite materials. In all efforts to innovate, new products and ideas are clearly interwoven with novel production technologies. WF2 has applied for patents to secure specific technologies. It presents a satisfactory sales rate, is highly innovative and extends its market with differentiated products. However, it focuses only in the national market.

WF3-case

WF3 was founded by an entrepreneur with a PhD who rejected the safety of following well-established long-used patterns. He actually advised his father to “burn his own plant”, although it was one of the best kitchen-furniture companies in the region of Macedonia at that time.

Searching for strong initial advantages in the kitchen industry, the entrepreneur builds a concept on modular design which he names “box concept”. However, the implementation requires novel technology that can provide parameterization. He co-operates closely with machine manufacturers in Germany and they co-develop a multi-task CNC machine to fit the novel production process. The CNC machine will be then patented by the machine manufacturer (with the entrepreneur’s permission) and wins an innovation prize in a world machine exhibition. The initial target of multi-machinery is further developed in a well-organized and linked production system and novel requirements appear one after the other (e.g. material handling systems, relevant CIM program, adoption of design to industrial design) constantly improving the initial idea. The entrepreneur was further the first to use the CNC model and man-made raw material in Greece.

WF3 transcended the common sectoral technology producers and manufacturers, engaged benchmarking and focused on the relevant emerging problems when trying to advance from novel idea to physical creation. The entrepreneur deliberately shaped a new ecosystem in kitchen construction for small companies *based on automatization, parametric design and flexibility*. WF3 went on investing in novelties in production technologies. Indicatively, in 2001 it introduced CIM (i.e. Computer-Integrated-Manufacturing) in the Greek W&F industry. The following years it developed many fixtures and installations to solve specific problems of box-concept, introduced corian and artificial plywood in Greece, and new processes to apply novel design. In 2009, a new technology dyeing plant was built with many novelties to suit the existing automated processes.

WF3 was founded within an era that markets favored such investments; a ready-to-consume market and a high income economy, relative alluring subsidies and the flourishing industry of CNC machinery. The entrepreneur managed to keep staying a pioneer for more than a decade presenting fast growth sales and high level of innovativeness. The severe crisis of the last years (2009-2014) led to a downturn. However, the company manages to survive in a sector with more than 70% decrease in productivity.

All three cases have established long-lasting relations with their machine and raw material suppliers for New Product Development (NPD), production and process advancing purposes; research focuses mainly on experimenting with innovative material elsewhere produced, and alternative processes following mainly the try-and-error method. WF2 has further entered research clusters exploring all

potential for NPD regarding mainly processes and production technologies such as waste, by-products and energy production. There seems to be an embedded culture of constant learning and experimenting, while know-how is achieved by technology transfer and development. In all cases wood processing technology, wood behavior science, chemistry, mechanical engineering, material engineering, ICT and automation technology are engaged while certain other high-tech fields are involved in each case.

5. DISCUSSION - CONCLUSIONS

The paper discusses the role of production technologies in low-tech industries and more precisely in the wood and furniture industry. It examines the importance of selection and/or development of production technologies during venturing, as well as their relationship to competitive advantage and innovation performance within the frame of knowledge-intensiveness.

Case analysis confirmed the fact that knowledge is mainly incorporated into production via investment (Smith, 2008). The transformation of the innovative business concepts into marketable products presupposes the choice and set up of the suitable production technologies and the function of investment is precisely to implement *new knowledge in production technologies*. The commitment to physical creation is thus a significant transition point in venture creation. All three cases besides the use of standard equipment and technology, develop production technology novelties in order to create respective products. The important role that production technologies appear to play indicate that new low-tech ventures use knowledge from multiple and often trans-sectoral fields to intensively create and deploy many forms of production-relevant knowledge in order to develop the innovative production technologies, build their initial competitive advantage and enter mature and saturated markets in alternative ways.

A quite interesting issue is the fact that novel production technologies as venture enablers seem to act mainly as a vehicle to create niche and sub-niche markets. The new, knowledge-intensive W&F firms turned to innovative technologies and machinery in order to incorporate novelty and develop technological capabilities for high-level differentiation. Especially during establishment, the output of technological innovation constitutes the initial competitive advantage which has to be quite strong in order to enable entrance in mature and saturated markets.

Further investments in technology enhance the firm's innovativeness and performance. Advanced production technologies enable the capture of lucrative and more value-added markets avoiding obsolesce. Novelties in production technologies support the development of NPD processes, enable creative solutions to specific problems and give birth to new products/ services. According to the three

cases, all types of novelties seem to entail almost always a certain level of innovation regarding production technologies which may eventually range from production lines to engineering and operating procedures.

On the other hand, the case findings demonstrate the existence of reciprocal relationships between product and process innovation indicating that technological contexts *do moderate* the physical implementation of LT-KI initial business idea, whether it is product or process-focused. More specifically, the cases make evident that novel product development leads to process development and *vice-versa*. This is in line with relevant literature (e.g. Heidenreich 2009).

Accepted the fact that the requisite knowledge and skills are distributed across many agents, production technologies are developed by tapping together appropriate technology made of components of a vast range of origins. Thus, the nature of knowledge upon which technological activities draw appears to be multifarious regarding types of knowledge bases and skills and the ways they are used and applied in order to transform a concept into products and processes. Besides focusing on a few technological core competencies, all cases sustain competencies in multiple technology fields (in accordance with Granstrand, 2000). This is also in line with literature; more and more traditional firms now acquire a substantial part of their technologies from external sources (Lichtenthaler & Ernst, 2007). A significant feature of the observed innovations was the engagement of many stakeholders all along the value chain in the form of open innovation. Suppliers were of utmost relevance in this context, since low-tech firms rely heavily on raw material, machine and equipment technological advances. However, their role during venturing does not appear to be that important; they rather support than guide the initial novelty. Furthermore, innovation seems not to rest only on adaptation but on discovery and learning as well.

Actually, production technologies appeared to be results of co-development covering technologies and knowledge from a significantly varied range. Thus, the cases indicate that low-tech companies may be something *more than just "borrowers" and passive adopters of technology*. Yet, they verify the fact that entrepreneurial or managerial teams locate and organize the individual and often miscellaneous pieces of product and/or process technology they need in order to innovate. This regards mainly technologies internally developed or co-developed in cooperation with other stakeholders including potential patents obtained either by the new venture or by any other stakeholder. It should be mentioned here that machine manufactureres and suppliers of innovative raw materials are in their majority foreign companies which highlights a particular problem of national weakness.

Therefore, it appears that in LT-KI ventures and more specifically in W&F ones, competitive advantages are built on a mixture of existing production technologies with new innovative ones which may be borrowed by, and composed of many knowledge areas in the first stages of the

entrepreneurial process. Production technologies then seem to be further significant in the co-formation of the strategic directions for the new LT-KI venture with quite obvious impact on the marketable products and services as well as the formation of organizational procedures and even the formation of the new venture's culture.

The study is, to our knowledge, among the first to explore the role of production technologies in venturing and innovation within low-tech industries, especially under the notion of knowledge-intensiveness. It is the first to explore the relationship between production technologies and W&F venture creation and their role in sustaining a competitive advantage. It verifies the emerging aspects on the innovation ability and the significant role of knowledge bases in low-tech industries as well as the interdependence between product and process innovation in mature industries.

In spite the study's limitations regarding the case-study research design and the focus on W&F knowledge-intensive ventures, some managerial implications can be reasonably drawn. Entrepreneurs and managers should put emphasis on developing innovation regarding technological aspects and more precisely production technologies in order to sustain strong competitive advantages. Taking into account the fact that the sector of wood and furniture was hit rather hard by the crisis with losses of more than 30% for the wood sector and more than 60% for the furniture sector investments on production technologies' innovation seem to provide a solution to crisis periods, especially for SMEs.

ABSTRACT

The study combines the value cocreation approach with a profit function and discrete choice model to examine whether there is a balance between demand factors and policy factors accelerating certification decisions such that a divergence between the supply and demand of certified foods is avoided. Assuming that multiple stakeholders such as farm business owners, customers and public authorities are involved in value cocreation, the empirical investigation of an ordered logit model is based on the timing each producer implements quality management system (QMS). A first conclusion of the study is that the theoretical framework fits well and it can be used in a variety of cases when the balance between the demand and public policy factors affecting the business' decisions is examined. It is found that the factors accelerating the QMS implementation are consumers' demand for certified products and buyers' recommendations, the existence of local quality problems, the provision of information/technical support and the quality control exerted by authorities and penalisation. It is concluded that policy factors outperform demand factors, but because the most crucial factor is the control exertion and penalisation it is not expected an unbalanced development of the certified subsector if public policy measures avoid disturbing the conduct of the certified food market, e.g. by irrational subsidies. The results confirm also the validity of public policy as a means of effectively expanding certifications at the early stages and the role of private standards in shifting from public to private food sector governance.

Keywords: *value cocreation; quality decisions; accelerate certification; food market; quality policy*

INTRODUCTION

The implementation of Quality Management Systems (QMS) enables suppliers of agricultural and food products (farmers, manufacturers, wholesalers, retailers) to create customer value by enhancing quality and thus, market forces can generate incentives for voluntary provision of higher quality food products. Because the suppliers may not respond, public authorities impose the proper regulatory system for quality enhancement and consumer protection or they develop an adequate subsidy regime or technical support to encourage the food producers/marketers to implement QMS (Tselempis *et al.*, 2015; Durham *et al.*, 2011; Kuminoff and Wossink, 2010; Klintman and Bostrom, 2004; Lohra and Salomonsson, 2000).

Research results indicate that many food producers, especially small farms, are less likely to implement QMS (Handschuch *et al.*, 2013; Segerson, 1999). Thus, financial support or subsidies are needed, which may become less likely to be politically acceptable in certain countries in the world market or may lead in an unbalanced development in the certified subsector (Argyropoulos *et al.*, 2013; Hattam *et al.*, 2012; Läßle and Van Rensburg, 2011, Lohra and Salomonsson, 2000). Because the policy-directed food supply is a valid means through which food quality can be effectively regulated and some undesirable effects can result (Uematsu and Mishra, 2012; Martinez *et al.*, 2007), the following question arises: Can the demand- and policy-related conditions prevailing in agriculture and food production lead to an expansion of certification efforts avoiding an unbalanced development of the quality certifications?

Previous studies adopt agricultural modelling, utility function, average treatment effect approach, cost/benefit analysis and profit function to examine the farmers' certification decisions connected with the factors impacting them (Tselempis *et al.*, 2015; Soltani *et al.*, 2014; Veldstra *et al.*, 2014; Handschuch *et al.*, 2013; Kersting and Wollni, 2012; Uematsu and Mishra, 2012; Masakure *et al.*, 2011; Muriithi *et al.*, 2011; Asfaw *et al.*, 2010a & b; Khaledi *et al.*, 2010; Kuminoff and Wossink, 2010). Some others concentrate on the duration analysis to study the certification decisions (Hattam *et al.*, 2012; Läßle and Van Rensburg, 2011; Kallas *et al.*, 2010; Läßle, 2010). These studies do not examine the balance between the impact of demand-related and policy-related factors. The main goal of the present study is to combine the value cocreation approach with a form of profit function and the discrete choice model—to examine whether there is a balance between demand factors and policy factors accelerating certification decisions, such that a divergence between the supply and demand of certified foods is avoided.

The remainder of the paper is structured as follows. Second section presents the theoretical framework, followed by the hypotheses formation in third section. Forth section presents the specialisation of the model and data collection, and fifth section presents the model estimation, results

and discussion. The conclusions, implications and propositions for future research are offered in last section.

THEORETICAL FRAMEWORK

Value cocreation

In value creation view, value is created in the firm and then exchanged with the customer, whereas in value cocreation, value is cocreated by multiple stakeholders such as the suppliers, customers' communities and society at all (Yi and Gong, 2013; Sheth and Uslay, 2007; Anderson *et al.*, 2004; Prahalad and Ramaswamy, 2004). Regarding the certification, we assume three stakeholders who are involved in value cocreation: owners of the farm businesses deciding certification and offering certified products, customers' community and public authorities who aim the society's needs and interests to be met.

The farm business owners (farmers) offer certified products by investing in certification-related activities to create value in alignment with customers' needs and the public authorities' decisions which reflect the society's interests for higher quality of life and agricultural competitiveness. For successful value cocreation customers provide resources such as personal information, interpersonal relationships, suggestions and recommendations to others or toleration to situations when the products/services provided fail to meet their expectations. Public authorities create value by providing farm business owners with information and technical support or subsidies by financing quality-related programmes, by conducting controls and penalizations, etc.

Financial value

Because the cocreation of value enables financial value to be created for the business owner (Haksever *et al.*, 2004), we assume a farm business owner (farmer) who decides to implement an optional QMS, as this allows him/her to create value for customers and society. Thus, financial value is created, which can be measured by accounting-based ratio measures, sales, cost, price, revenues, or profits. Figure 1 illustrates the theoretical framework we build, focusing on the farm business' certification decision, which is affected by customer's related (demand) factors and public-policy factors. The farm business, in an attempt to increase the value it creates and, subsequently, to increase financial value, accelerates certification. That is it provides customers and society with more total value at time t , by offering certified quality for longer time, and thus can maximise its total profits. More specific it offers its food product at a quantity of $q = \bar{q}$ (assume unchanged at time t) and at quality of Q , which depends on t , obtaining a price p , which also depends on Q ; the financial value created can be represented by the profit, defined as follows:

$$\pi(t) = pq - C(q, Q) \quad \text{so that } p = P(Q) \text{ and } Q = Q(t). \quad (1)$$

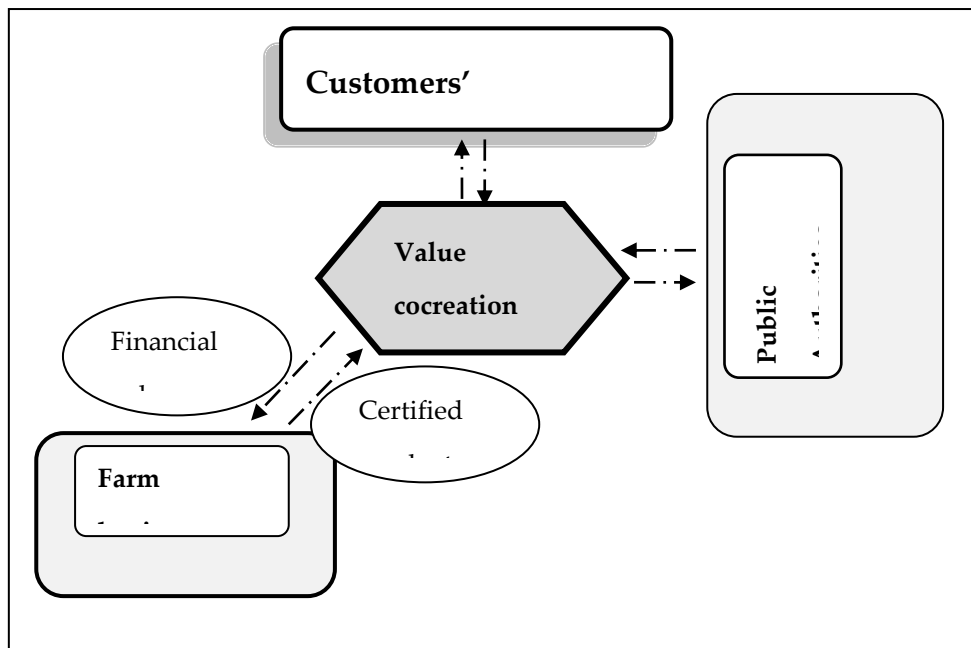

Figure 1. Value-creation by farm businesses, customers and society

That is, the profit of the farm business at time t depends on quantity produced at time t and the price, which depends on quality (Q) supplied at time t , and the cost (C), which depends on the quantity (q) produced at time t and the quality (Q) supplied at the same time. The first order derivative of equation (1) is:

$$\frac{d\pi(t)}{dt} = \frac{dP[Q(t)]}{dQ} \frac{dQ(t)}{dt} q - \frac{dC}{dQ} \frac{dQ(t)}{dt}$$

which takes the form (2):

$$\frac{d\pi(t)}{dt} = \left[\frac{dP[Q(t)]}{dQ} q - \frac{dC}{dQ} \right] \frac{dQ(t)}{dt} \quad (2)$$

Because the longer the time the farm business is certified, the greater the quantity of the certified product supplied in the market ($\frac{dQ(t)}{dt} \geq 0$), and $\frac{dP[Q(t)]}{dQ} q \geq 0$, while the $\frac{dC}{dQ} \leq 0$ due to economies of experience in quality management and economies of size in quality certification (Ragasa *et al.*, 2011), we expect that $\frac{d\pi(t)}{dt} \geq 0$. Thus, it is expected that when the time at which the farm business is staying certified increases, its profit increases and the farmer attempts to implement QMS at an early stage. Equation (2) helps us to connect the value that the farm business creates both with the financial value created and the farmer's decision to implement QMS at time t . Because it would be more precise if we use the net present value of profit instead of $\pi(t)$, we give more definition in the method section.

RESEARCH HYPOTHESES

The impact of public authorities' value creation on farmers' certification decisions can outperform the impact of customers' value creation. In such a case, the state-induced implementation of QMS dominates the demand-related incentives and the farmer's decision to be certified at an early stage can be affected mostly by the public-policy factors and an unbalanced development of the certification can occur. Thus, the first hypothesis is formulated.

H1: There is not an imbalance between the demand and policy factors that accelerate certification, such that public policy factors outperform demand factors in a way that can lead to a divergence between the supply and demand for certified food.

The policy-directed food supply is acknowledged as a valid means through which food quality can be effectively regulated (Martinez *et al.*, 2007) and the third-party certification reflects a broader shift from public to private governance in the food sector (Hatanaka *et al.* 2005; Henson *et al.*, 2005). The development of public QMS standards or schemes being available for farmers is a policy measure by which public authorities cocreate value at the starting stage of the evolution of certifications, while the private standards are developed in a later stage. Thus, it is useful to associate the type of the standard with the farmer's certification decision, leading to the formulation of a second hypothesis:

H2: The probability that the farmers decide to implement QMS at an early stage depends on the type of the quality certification scheme they adopt.

If the hypothesis is not accepted, it is not ascertained the validity of public policy as a means of effectively expanding certifications at the early stages and the role of private standards in shifting from public to private food sector governance. Thus, public authorities, certifiers and marketers should revise their certification related policies.

As Karipidis and Tselempis (2014) reported there exist several quality certification schemes that are suitable for certifications at farm business level, such as the national standards (AGRO 2.2 in Greece), the 'Organic Certification', the 'GlobalGAP', 'Quality and Safety' and 'Tesco Nature's Choice'. The organic certification differs substantially from the other certification schemes in its requirements, organisational structure, implementation and auditing, which are connected with differences in certification costs, customers' requirements and preferences and farm business revenues. It makes useful to capture for a different impact of organic certification on farmers' decisions, and thus a third hypothesis is formulated.

H3: The organic certification scheme accelerates the certification in a different way than other quality certification schemes.

If the hypothesis is not accepted, it is ascertained that there is not a different impact of organic certification implying that there is not a necessity for public authorities, marketers and certifiers to differentiate their certification related policies.

METHOD

The value cocreation framework presented previously enables us to analyse the value a farm business creates in conjunction with the value created by customers and public authorities. More specific, the farm business creates value and, subsequently, increases financial value by investing in quality certification in order to offer certified products to customers and society. Farm owner accelerates certification in an attempt to increase the financial value, by offering certified quality for longer time, and thus it maximises the total profits.

The discrete choice model

The discrete choice model can be used to examine how decisions are influenced by the conditions under which they are realised. There has been an extensive use of it to locate the factors affecting farmers' choices, regarding the adoption of innovations, new methods, new technologies and quality standards (Tselempis *et al.* 2015; Herzfeld *et al.* 2011; Wheeler, 2008; Wynn *et al.* 2001) or the maintenance of certification (Karipidis and Tselempis, 2014). The focus of this study is the acceleration of certification decision, which reflects the time (t) the farm business offers certified products. It can be represented by a qualitative variable measured via an ordinal, five, less or more -point, scale.

In the discrete choice models, the dependent variable (y) is a rough categorisation of a continuous but unobserved variable y^* (timing). If y^* could be directly observed, then standard regression methods would be used, such as assuming that y^* is a linear function of some independent variables. The acceleration of QMS decision model can take the form:

$$y_i = a_i X_i + u_{ij} \quad (3)$$

y_i is used as a proxy for y_i^* . According to this model, the farmer chooses alternative i (time to implement QMS). The explanatory variables reflect the factors connected with customers' value cocreation (demand side) and public authorities' value cocreation (policy measures). The u values are unknown parameters to be estimated with the unknown coefficients of the variables.

The present study uses a three-point scale to measure the timing: in the case the farm business implements QMS at an early stage it is staying under the certification for the maximum time and t takes the maximum value ($t=3$), while in case it implements QMS at a later stage it is staying under the certification for the minimum time ($t=1$). The relationship between the three categories of y_i and the values of y^* is presented in table 1, in correspondence with the net present value of profit instead of $\pi(t)$, as it is stated above. r represents the interest rate.

Estimated time	Net present value of the profit
$y_i = 1$ if $y_i^* \leq 1$	$\pi(t) = \pi_1$
$y_i = 2$ if $1 < y_i^* \leq 2$	$\pi(t) = \pi_2 + (1+r)\pi_1$
$y_i = 3$ if $2 < y_i^*$	$\pi(t) = \pi_3 + (1+r)\pi_2 + (1+r)^2\pi_1$

Table 1. Connecting the timing of certification with the net present value of the profit

Specialisation of the model

Based on the study of Tselempis *et al.* (2015), we introduce eleven demand-related (market) and five public policy factors in order to empirically investigate the proposed framework and test the first hypothesis. We add also two variables helping us to test the second and third hypotheses. The model (3) can take a probit or logit form, so that we can analyse the farmer's acceleration to implement QMS with the demand and policy factors. It becomes

$$y_i = a_k^D X_k^D + a_j^P X_j^P + b_1 Z_1 + b_2 Z_2 + u_{ik} \quad (4)$$

where X_k^D represents the demand-related factors ($k=1, \dots, 11$), and X_j^P represents the public-policy factors ($j=1, \dots, 5$) that may affect the farmer's decision.

We introduce the dummy variable (Z_1), which represents the type of standard the farmer adopts in the model to examine the second research hypothesis; because 0 represents the public quality scheme and 1 represents the private scheme, it is expected that Z_1 impacts y_i negatively. In an attempt to capture the differences in implementation decisions regarding organic certification and test the third hypothesis, an additional dummy variable (Z_2) is introduced, taking the value 2 in the case where the quality certification scheme is organic and 1 for every quality certification scheme different from the organic scheme.

Data collection

A survey, which was developed using the findings of previous studies, and a small-scale pre-test with some in-depth interviews were conducted in the winter of the 2011. All the necessary modifications were made to take into account the comments and suggestions received, which primarily concerned difficulty in answering the questionnaire (including its size), the clarity of the questions, and their order. The questions were answered in reviews conducted with the heads of the certified farm businesses dispersed all over the region of Central Macedonia—North Greece—in the spring and summer of 2012. These farm businesses were randomly selected from a database held by the regional services of the Ministry of Agricultural Development and Food. After discarding a number of problematic questionnaires, we were able to use a total of 231 in our analysis.

EMPIRICAL INVESTIGATION, RESULTS AND DISCUSSION*Model estimation*

Estimations regarding the decision model (ordered logit) are conducted using the Eviews programme; we use the Huber/White option to compute robust (quasi-maximum likelihood) estimators, in the sense that consistent estimates of parameters are produced, even if the distribution is incorrectly specified. The results regarding the impact of the demand-related and policy factors are presented in Table 2, including coefficient estimates, Z-statistics and p-values. It is determined that the null hypothesis is rejected and that all of the independent variables affect the variability of the dependent variable because the log likelihood value of 115.9587 is highly significant (prob. 0.000). The average score of the time respondents implement QMS is 2.42 (>2), meaning that the most of the farmers of the study implement QMS at an early stage rather, taking into consideration the timing of certification. Because the model estimation is based on aggregated data, including the adoption of five quality certification schemes, with differences among them, we do not expect the interpretation capacity of the model to be high. Though there are no previous studies similar to the present, the interpretative ability (Pseudo R-squared 0.274416) can be considered adequate comparing it with the interpretative ability of analogous studies that estimate adoption models in the case of one or two certain certification schemes (Handsouch *et al.*, 2013; Wheeler, 2008).

Results and discussion

As seen in Table 2, six of the 18 independent variables substantially participate in the formation of the dependent variable's variability, at a significance level of 0.05. Therefore, one may deduce that six of the factors examined affect the farmer's decision to implement QMS at an early stage or accelerate farmer's certification decision. Three of the factors pertain to the demand and affect the farmer's decision positively. More specifically, the demand of certification by buyers, which will eventually lead to an increase in revenue, renders it more probable that the farmer will implement QMS at an early stage. The same applies when the farmers are advised to be certified by the buyers and when there are local quality-related problems, in which the farmer tries to differentiate her/his products from local products and make them more attractive to potential customers.

Group	Factors / independent variables	Coeffic.	Z-stat.	Probab.
DEMAND – factors	1. Customers are interested in certified products	0.385379	1.409865	0.1586

Table 2. Estimation results of the model including the factors of outer environment

Regarding the two policy factors accelerating certification decisions, one of them is found to affect the decision negatively, while the other affects it positively. Specifically, failure to supply the appropriate information and technical support for farmers negatively affects the QMS implementation at an early stage. This could be attributed to the farmer's inability to assess the benefits of QMS implementation and to the fact that information provision lowers the certification-related costs. On the other hand, the exertion of control and penalisation causes farmers to accelerate the implementation of QMS.

The findings of the study concerning the demand for certified products and the control exerted by the authorities ascertain and complement analogous results of previous studies, such as Asfaw *et al.* (2010b) and Masakure *et al.* (2011), providing evidence of the role of lower transaction costs in the certified product market and regulatory enforcement within the certification decisions in food supply chains. The findings concerning the role of information and the provision of technical assistance to farmers in their certification-related actions confirm and extend the results of Muriithi *et al.* (2011), Kersting and Wollni (2012) and Dimara *et al.* (2004). The findings regarding the local quality problems partially confirm and complement the results of Uematsu and Mishra (2012) concerning the impact of farmers' participation in a state branding programme and the impact of the "regional factor" on farmers' adoption decisions.

A further exploration of the impact of the three demand and the two policy factors becomes possible by estimating the "elasticities" ($e_i = a_i \bar{y} / \bar{X}$). These allow us to rank the factors accelerating the implementation of QAS because reflect the percentage of increase or decrease (%) in the mean probability that farmers accelerate certification if the mean value of a factor increases 1%.

The elasticities presented in table 3, indicate that the public-policy factors outperform the demand factors and this could lead the *H1* hypothesis not to be accepted. It is observed that the elasticity in the

case of “control exertion by public authorities and penalisation” (>8.2), indicating that this factor accelerates the certification in a degree that outperforms the degree of acceleration caused by all the other factors together. Because this factor reflects the pushing of farm businesses to respond to the mandatory quality requirements contributing to the consumers’ safety and the enhancement of quality of life, it is not expected a divergence between supply and demand. Thus, the **H1** is accepted.

Demand	Factor	Elasticities	Sum
	Buyers demand for implementation of QMS	0,4361	
	Advice – buyers’ recommendations	0,3487	
	Local quality defects or problems	2,5395	3,3243
Policy	Absence(-)/Presence(+) of appropriate information / technical support	0,6171	
	Penalisation and control exerted by the authorities	8,2456	8,8627

Table 3. *Order of market & policy factors*

Regarding the choice of a public or private type of quality certification scheme the results indicate that public standards are mostly chosen by farmers implementing QMS at an early stage, while private standards are mostly adopted by farmers implementing QMS at a later stage. More specific, the choice of a public certification scheme is connected with the probability that the farmers implement QMS at an early stage and the choice of private certification scheme is connected with the probability that the farmers implement QMS at a late stage. Thus, the **H2** hypothesis is supported. This result confirms and extends the report of Hatanaka *et al.* (2005) concerning the role of the third-party certifications to shift from public to private governance through time in food supply and the conclusion of Martinez *et al.* (2007) for the effectiveness of the public regulation in food supply.

Regarding the **H3** hypothesis, that the organic certification scheme accelerates the certification in a different way than other schemes, the results do not give support. It implies that there is not a necessity for public authorities, marketers and certifiers to differentiate their certification related policies if their main goal is the acceleration of quality certifications.

CONCLUSIONS AND IMPLICATIONS

Conclusions

The study combines the value cocreation approach with a profit function and a discrete choice model to examine whether there is a balance between policy factors and market factors accelerating certification decisions. It proposes a theoretical framework which assumes that three stakeholders are involved in value cocreation: owners of the farm businesses, customers’ community and public authorities. A first conclusion of the study is that the model fits well in the case where demand and policy factors accelerating the implementation of QMS are examined comparatively, implying that it should be used in a variety of cases of product markets.

The demand factor having the strongest impact on the acceleration of certification is the existence of local quality problems in which the farmer tries to differentiate her/his products from local ones and the policy factor with the strongest positive impact is the control exertion by public authorities and penalisation. The results indicate that the public policy factors outperform demand factors, but because the control exertion and penalisation reflects the response of the food supply to the mandatory quality requirements, a divergence between supply and demand is not expected, such as it would be expected in the case of the provision of subsidies.

Regarding the type of quality certification scheme the farmers choose in conjunction with the acceleration of certification, the study concludes that: (i) the choice of public standard at an early stage implies that policy-directed certification is a valid means to expand the certifications effectively at an early stage of the evolution of certification, (ii) the choice of private standard observed at a late stage implies that the efforts of market players replace policy-directed certification at a later stage, and (iii) though the organic certification differs substantially from the other certification schemes, there are no findings indicating that the organic certification scheme accelerates the certification in a different way than other certification schemes.

Implications for practitioners and for future research

As some certification-related policy measures can lead to a divergence between supply and demand of certified foods, the public authorities should be cautious not to greatly weaken the market incentives for farmers. More specifically, the authorities should maintain or intensify quality controls or increase the punishments for violations of the quality rules, but they be very cautious in setting subsidies for farmers. They should encourage or facilitate farm businesses to accelerate QMS implementation by planning and/or supporting the proper provision of information and consultancy for farmers, informing the marketers and consumers by promotion campaigns, supporting local/regional quality-related programmes combined with local or regional branding schemes.

Marketers/buyers of agricultural and food products should strengthen the certification-related market incentives for farmers. More specifically, they should encourage farmers to implement QMS by revealing a preference for certified products, rewarding them with higher prices, properly advising and informing farmers who are their suppliers, by financing information campaigns for consumers or by providing financial support and credit. There are special challenges for marketing cooperatives or groups of farmers which can attain size economies minimising the certification costs and maximising the benefits for their members and thus, make the certification more attractive for farmers. Farmers and their unions will increase the efficiency of quality certification if they choose it as a response to the demand, which will help farm businesses to avoid penalisation but they need to be wary of subsidies that may ultimately prove harmful.

An important limitation of the present paper is that the model estimation is based on somewhat aggregated data in the sense that five quality certification schemes are included in data collection, thus, it explores farmers' decisions to implement QMS independently of the quality standard they adopted. Though our findings do not indicate a clear impact, future research could address this issue by considering the impact of market and policy factors for each case of individual standards, separately, in order to gather more analytical information which can be lost by the aggregation.

THE INTERACTION BETWEEN FISCAL POLICY AND ECONOMIC GROWTH: CASE OF OECD COUNTRIES

Kotlán, Igor; Machová, Zuzana; Murín, Martin

Faculty of Economics, VŠB Technical University of Ostrava, Ostrava, Czech Republic

ABSTRACT

For the sustainable development of any company it is crucial to recognize macroeconomic performance and its changes. Without doubt, the economic development affects the gains and decision making of them. Cognition of the interaction between fiscal policy and economic growth can help companies to react more appropriately and faster, especially during current sovereign debt crisis. The aim of this paper is to describe the interaction between taxation, government expenditures, and economic growth and to find out how long these interactions persist in the economy of OECD members. To meet these goals a panel VAR model estimated by GMM is used to construct an impulse-response function. The analysis is performed for 34 OECD countries in the period between 2000 and 2012. The results show that it lasts approximately five years till the GDP growth rate returns to its initial level after a temporary fiscal shock. The impact of taxation is always in the opposite direction to the effect of government expenditures. Permanent changes of fiscal variables lead to a permanent change of the steady growth rate. Taxation is harmful to growth, while expenditures appear to be productive. There is a hint of regressive tax burden among OECD countries when the persistent increase of the economic growth is taken into account. For the company's adaptability it appears to be the most important thing to distinguish between temporary and persistent changes.

Keywords: *Fiscal Policy, Economic Growth, Panel VAR, Impulse-response Function*

INTRODUCTION

There are no doubts that every company is affected by the macroeconomic performance. If we consider an appropriate economic growth as an indicator of healthy economic development one must know its determinants. Nobody can argue that fiscal policy is one of them. Especially in this time of sovereign debt crisis when future fiscal measures are insecure, companies which properly understand the interaction between fiscal policy and economic growth can gain relatively strong competitive advantage. These companies should react on fiscal policy changes better and earlier and they should be

better in creating expectation about the future fiscal measures according to actual economic performance. Many economists claim that there is no more significant factor for the sustainable development than knowledge. Only knowledge can create economic environment that is able to adapt quickly, grow faster and be more sustainable.

If the public debt and its distortion effect are not taken into account, the main fiscal variables influencing the economy are government expenditures and government revenues. Both these categories effect not only the economic growth, but mainly the individuals' decision making process (see below). Thus the aim of the paper is to discover how long the influence of tax and expenditures changes persists in the economy of developed countries gathered in the OECD. To achieve the goal, a panel VAR model is used to construct impulse-response functions. To measure the level of taxation, two alternative indicators are used. Those are the standard tax quota and the World Tax Index (WTI).

THE INFLUENCE OF FISCAL POLICY ON ECONOMIC GROWTH

If we want to investigate the interaction between fiscal changes and economy performance, at first it is necessary to explain how fiscal policy can influence the economic growth in general. The easiest way to deal with this subject is to divide fiscal policy into two non-independent groups, namely government expenditures and taxation. There is a generally accepted consensus among economists, that taxation has a significant effect on firms' and individuals' activity which leads to its economic growth effect. This effect is rather considered to be negative. From the theoretical point of view, government expenditures have two antagonistic effects. Productive expenditure (for example investment in infrastructure, health, education or R&D) should promote growth rates, while non-productive ones (social benefits, government consumption) should be harmful to growth. Final impact of total expenditures depends on proportion of these two groups, efficiency of public sector and their initial level. For more details, see e.g. Drobiszová and Machová (2015).

Neoclassical model by Solow (1956) and Swan (1956) presumes that sooner or later, the economy reaches a steady state in which GDP per capita growth is only affected by exogenous factors such as technological progress and population growth rate. According to the conclusions of the model, economies that are already in the steady state are faced with a situation whereby the fiscal policy is unable to influence the per capita growth rate. Consequently, such a policy affects the growth only temporarily - in the period between steady states. For more details, see e.g. Barro and Sala-i-Martin (2004).

Nevertheless, in latter endogenous growth models presented e.g. by Lucas (1988) or Romer (1986), a different mechanism is used, according to which the fiscal policy may affect the growth of per capita

output not only between steady states but also in the steady state. Therefore, the mechanism has a tier as well as a growth effect. Empirical results based on the models are ambiguous and not all the economists agree with the model conclusions. For example, while Aschauer (1989) suggests that, in a steady state, taxation can have a demonstrable impact on long-term growth, e.g. Kneller *et al.* (1999), on the other hand, believe that taxation has no significant effect on steady state growth. Likewise, the differences are gained by results of empirical works dealing with expenditure side of the fiscal policy. While Kneller *et al.* (1999) or Izák (2011) claim that productive spending truly has positive growth effect, some recent papers imply some doubts. Let's consider public investment as the most productive sort of expenditures. Afonso and Jalles (2014) suggest that the public investment appeared to weaken growth in long-term. It is also important to emphasize that the conclusions are based on the analyses performed only for developed democratic countries. In case of different conditions, as explained by Gindin (2013), Morilhat (2013), Ridenti (2013), Vargas (2013), Polasek and Sellner (2013), Andreani and Herrera (2013), or Couland (2012), the results may be completely different.

In general, we can say that authors of the models that are presented below use two different approaches. The first one can be called a Social Planner Approach. The social planner is a decision-maker who sees the economy from above as a whole and his aim is to achieve the best result for the whole economy - he seeks for maximization of social welfare function. This approach is followed e.g. by Milesi-Ferretti and Roubini (1998), Mendoza, Milesi-Ferretti and Asea (1997), or later by Denaux (2007). On the other hand, the second approach is possible to be used that can be called an Economic Agents Approach. The difference is that using such an approach, different behaviour of different groups of agents is considered - firms seek for maximization of profit, households seek for maximization of utility, etc. This approach is followed e.g. by Barro (1990), Barro and Sala-i-Martin (2004), Kotlán and Machová (2014a), or Machová and Kotlán (2013a, 2014b).

The problem is that none of these approaches shows particular effects of different types of taxes that are applied in developed economies, i.e. taxes on wages, profits, consumption and property, in the model. Thus Kotlán and Machová (2014b) modify the model as follows:

$$\gamma = \frac{\dot{\hat{k}}}{\hat{k}} = (1 - \tau_w) \left[\frac{f(\hat{k})}{\hat{k}} - f'(\hat{k}) \right] + (1 - \tau_a) \left[f'(\hat{k})(1 - \tau_\pi) - \delta \right] - (1 + \tau_c) \frac{\hat{c}}{\hat{k}} + \frac{\hat{tr}}{\hat{k}} - x - \frac{\dot{l}}{l}, \quad (1)$$

where γ is the growth rate of the economy, K is physical capital, L is labor (l is per capita labor) δ is the depreciation rate, TR are transfers, x is the technology growth rate, τ_π , τ_w , τ_c , τ_a are tax rates of taxes on profits, wages, consumption and property, respectively. $\hat{L} = Le^{xt}$ is applied, and then $\hat{k} = (K/\hat{L})$,

$\hat{c} = (C / \hat{L})$ and $\hat{tr} = (TR / \hat{L})$. For more, see Kotlán and Machová (2014b). The model therefore shows that, according to economic theory, the resulting effect of taxation on growth through all types of taxes, i.e. taxes on profits, taxes on wages, property taxes and consumption taxes, should be negative, which makes the hypothesis for the empirical part of the paper.

Nevertheless, in the analyses below, also government spending is included as suggested e.g. by Kneller *et al.* (1999), or Bleaney *et al.* (2001), because taxes are in general used to finance it. If a substantial part of the expenditure is used to finance government investments (productive government expenditure), then both government expenditure and taxes may in certain circumstances affect the growth positively, especially in the situation of prevailing part of indirect taxes in the tax mix of an economy.

METHODOLOGY AND DATA

The analysis is performed for 34 OECD countries in the period 2000-2012. From a methodological point of view, a panel data VAR model is used. Endogenous variables include real GDP per capita (*GDPCAP*), government expenditure to GDP ratio (*EXP GDP*) and a variable for taxation approximation (see below). Exogenous variables are real investment to GDP ratio (*INV GDP*) and human capital (*HUM*) approximated by an indicator according to Feenstra, Inklaar and Timmer (2013), based on the years of schooling and investment into education.

The VAR model consists of three equations using real GDP per capita, government expenditure to GDP ratio, and taxation as dependent variables. All the other variables are always independent. All the variables are used in the logarithmic form for better interpretation and comparison of results, as their values are at different scales.

The nature of VAR models clearly suggests that a dynamic panel was used and that a generalized method of moments (GMM) was used for estimation, specifically the Arellano-Bond estimator (see Arellano and Bond, 1991). The below VAR model includes a lag of one period, as is usual in such types of studies (see e.g. Acosta-Ormaechea and Yoo, 2012, and Arnold *et al.*, 2011).

The tax approximation was gradually implemented in two ways. First, using the standard tax quota (*TQ*), that is the share of tax revenues in nominal GDP. With regard to the shortcomings brought about by the tax quota (see, e.g. Kotlán and Machová, 2012a), the analysis uses the World Tax Index (*WTI*) as an alternative to the tax quota. This tax burden indicator combines hard data on taxes available from internationally recognized sources such as the OECD and World Bank databases, with data expressing Qualified Expert Opinion (QEO) that are used as the weight for the hard one. The QEO was gained

from a large-scale questionnaire survey conducted in three waves during 2010-2012 among tax specialists from all OECD countries.

Unlike TQ, the WTI seeks to produce an evaluation incorporating the maximum number of aspects associated with e.g. tax progression, administrative difficulty of tax collection from the perspective of payers, the range of tax exemptions, options concerning the tax deductibility of expenses, etc. For more on the WTI construction and its values, see Kotlán and Machová (2012b), and Machová and Kotlán (2013b).

Most of the data used, especially the level of GDP, government expenditure, and taxation (the tax quota) was drawn from the OECD iLibrary Statistics and OECD Factbook Statistics. The hard data that was used to construct the WTI and its sub-indices was obtained from the OECD Tax Database and OECD Tax Statistics, additionally also from the World Bank's Doing Business project database.

In terms of methodology, stationarity tests using the panel unit root according to Levin, Lin and Chu (2002), Im, Pesaran and Shin (2003) or Maddala and Wu (1999) were performed first. All the variables were found to be stationary, thus we use the first differences (D) of logarithmic forms of the variables. Using a robust estimator in calculating the covariance matrices ensured that the results of standard deviations of parameters and hypothesis tests were correct with regard to a possible occurrence of autocorrelation and heteroscedasticity. This method is called the "White Period" and it is enabled by the econometric software used. The estimates employed the model with fixed effects, which is, according to Wooldridge (2009), more suitable in the case of macroeconomic data as well as in a situation where the cross-sectional units are countries.

RESULTS OF PANEL VAR MODEL

With regard to the aim of the paper, we only present the results of the first equation of the model, where economic growth is dependent variable, and taxation, government spending and classical growth variables are independent. Following table (1) shows the results of the equation in two variants; at first using the TQ as taxation proxy and the second one using the WTI. In the analysis, 34 instruments were used. The validity of the instruments was tested using the standard Sargan test at the 5% significance level (as indicated by J-statistic in the table (1)). All the estimation results presented in the tables below were thus confirmed as correct.

Concerning the standard growth variables, it is shown that the effect of physical capital accumulation (*INV*GDP) is positive in both models. In case of human capital accumulation (*HUM*), the positive effect was not proved with regard to the statistical significance of the variable.

Dependent variable	D(LOG(GDP))			
Taxation Proxy	TQ		WTI	
No. of observations	340		340	
No. of instrument	34		34	
J-statistics	31,877		30,584	
	Coefficient	t-statistics	Coefficient	t-statistics
D(LOG(GDP(-1)))	0,052	3,380***	0,075	7,142***
D(LOG(INVGDP))	0,431	60,073***	0,400	61,619***
D(LOG(HUM))	-0,022	-0,101	0,009	0,058
D(LOG(EXPGDP(-1)))	0,190	22,572***	0,111	13,895***
D(LOG(TQ(-1)/WTI(-1)))	-0,177	-16,586***	-0,098	-10,542***

Table 3. *Results of pnel VAR model using economic growth rates as a dependent variable*

Above all, the results of the analysis confirm the hypothesis about the negative impact of taxation on the economic growth, irrespective of the taxation proxy that is used in the analysis. On the other hand, the effect of government expenditure is positive, which indicates that most of the expenditure is spent on government investment and not consumption. However, despite this fact, the influence of the taxation as a whole is still confirmed to be negative. This could indicate that in the countries surveyed, there is excessive tax burden in the form of taxes, which do not purport to finance productive expenditure, but only unduly burden the economy. This harms economic growth and leads to the reduction of the positive effects of productive government spending.

IMPULSE-RESPONSE FUNCTIONS

The essential part of the analysis based on the VAR models is the construction of the impulse-response functions, which also make the most important part of the paper. They are based on the estimated regression coefficients of all the three equations of the model. The functions are, first, the functions of the "impulse" type that simulate the effects of single (temporary) changes (shocks) in independent variables on dependent variable, and the functions of the "step" type that simulate permanent changes in independent variables.

In following figures (1-4), the impacts on taxation are simulated in the first column, impacts on government expenditure in the second column, and impacts on growth in the third column. Analogically, the impacts of changes in taxation are simulated in the first row, in expenditure in the second row, and in growth in the third row.

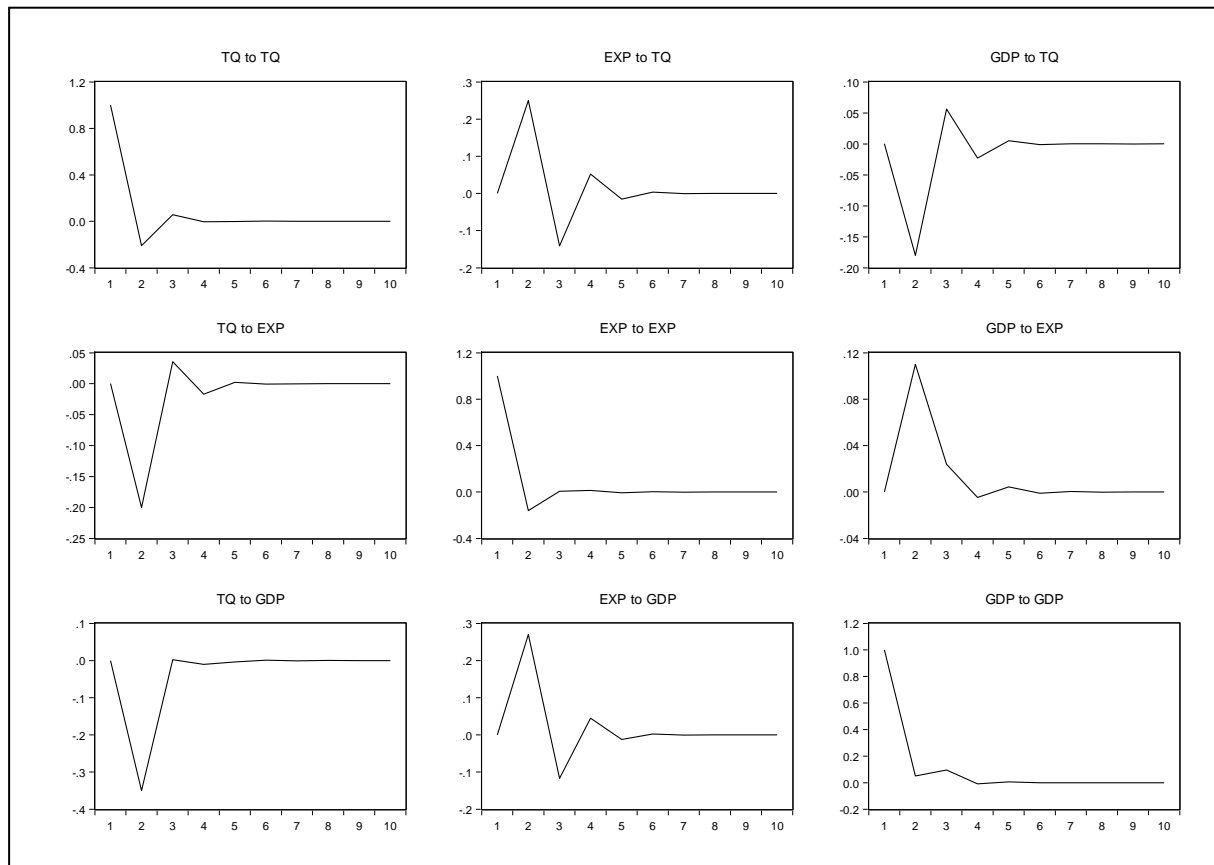

Figure 2. *Impulse function for the TQ (Source: own calculations)*

Figures (1) and (2) are related to the models including the tax quota as the taxation proxy. The graph in the right top corner of the figure (*GDP to TQ*) shows how the economic growth reacts on the changes in the growth rate of taxation. When a temporary change of taxation, which is removed in the next period, is made, there is also a temporary decline in the economic growth rate, but over time it stabilizes at its original level.

The reaction of growth rate of government expenditure (*EXP to TQ*) is similar. In the second period there is an increase in response to the increase in the tax rate, then there is a significant decline and a gradual return to the initial level.

In the second row, the graphs that show the response of individual variables on a temporary change in the growth rate of government spending are shown. The first graph (*TQ to EXP*) shows how changes in government spending affect the tax quota. Its growth rate is declining at first, but then there is a

reversion to the original level. The quota similarly responds to changes in GDP growth (*TQ* to *GDP*) as well.

GDP and government spending react similarly to each other. In the second period they increase sharply, which is gradually smoothed (*EXP* to *GDP*, and *GDP* to *EXP*).

It can be concluded that the responses to temporary changes in fiscal variables (in case the approximation of taxes through tax quota) and economic growth are relatively strong in the second period after the occurrence of a shock, but the values gradually return back to their initial levels, which takes approximately five years.

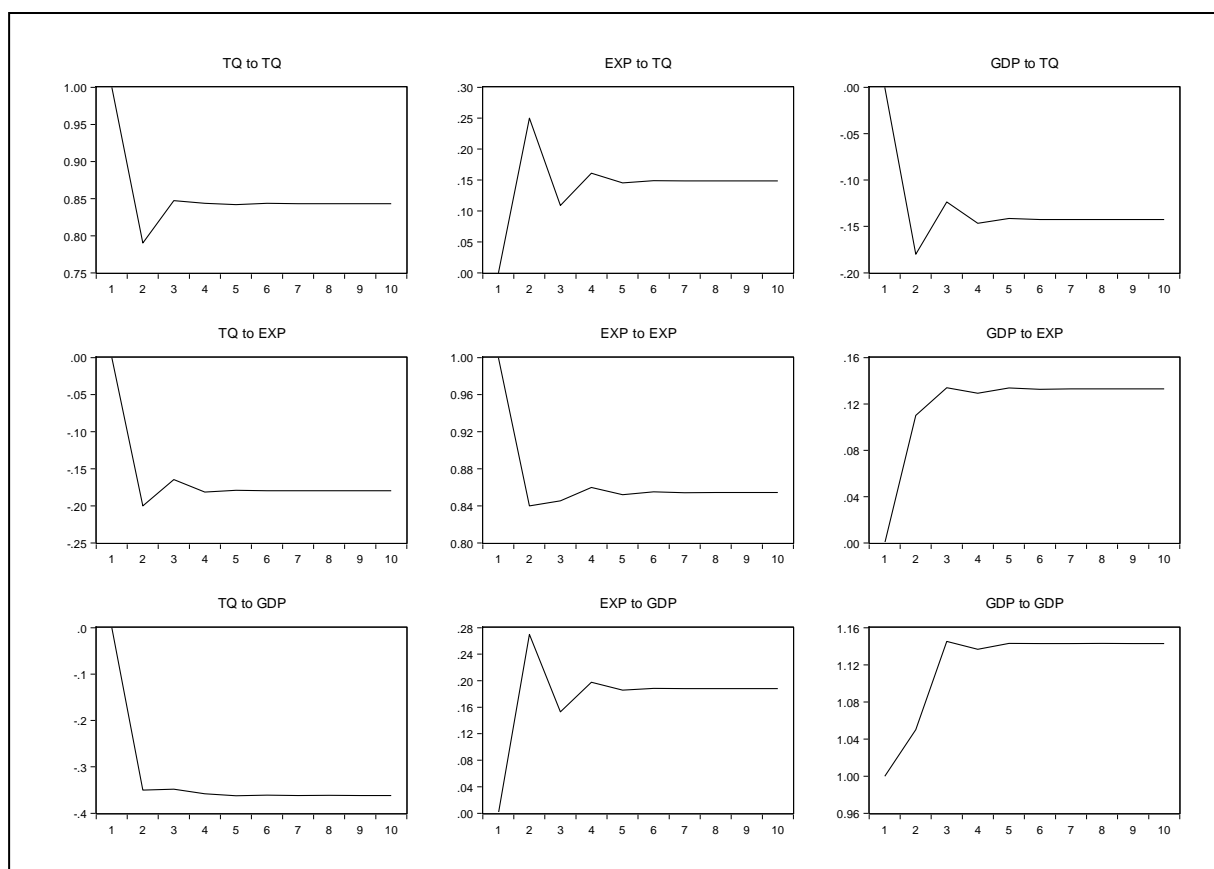

Figure 3. Step function for the TQ (Source: own calculations)

In contrast, in the case of permanent changes in taxation, i.e. a permanent increase in the growth rate of the level of taxation, the rate of economic growth is stabilized at a new level which persists in the economy even after ten years (*GDP* to *TQ*), even though a permanent increase in the growth rate of government expenditure occurs in the economy, as shown in the graph (*EXP* to *TQ*).

Growth rate of tax quota is stabilized at a new, significantly lower level in case of a permanent change (increase) of the rate of growth of government spending (TQ to EXP), but also of the rate of economic growth (TQ to GDP).

In contrast, the relationship between economic growth rate and the growth rate of government expenditure (EXP to GDP , GDP to EXP) is positive. Also in this case, the positive effects persist in the economy even after ten years.

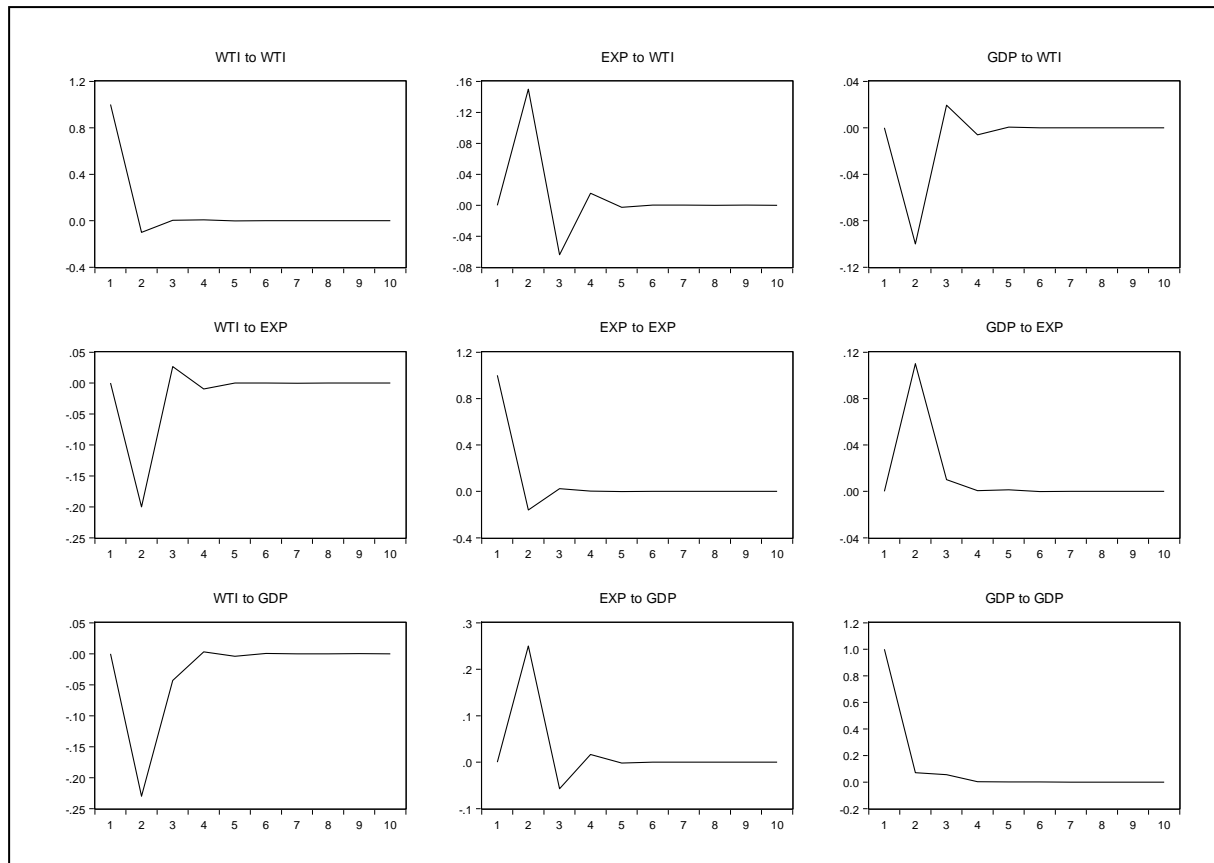

Figure 4. *Impulse function for the WTI (Source: own calculations)*

Figures (3) and (4) show the impulse-response functions resulting from the model where the WTI was used as a taxation proxy. Even in this case, growth rates of GDP and fiscal variables react quite sharply to each other in the second period, but then the situation relatively quickly returns to baseline values, and the initial level is reached at the latest after five years.

Taxation causes a positive shock in GDP and government spending growth rate, which is shown in graphs (GDP to WTI , EXP to WTI). Negative shocks are caused in the area of taxation in case of temporary change (increase) of the rate of growth of both government expenditure and GDP (WTI to EXP , WTI to GDP). Growth rates of GDP and expenditure react positively on each other (EXP to GDP , GDP to EXP).

Also in case of the model including the WTI, permanent changes in the growth of the variables cause significant changes in the growth rate of other variables which persist in the economy even after ten years. There have been no significant differences between models using the tax quota and the WTI as a proxy for measures of tax burden.

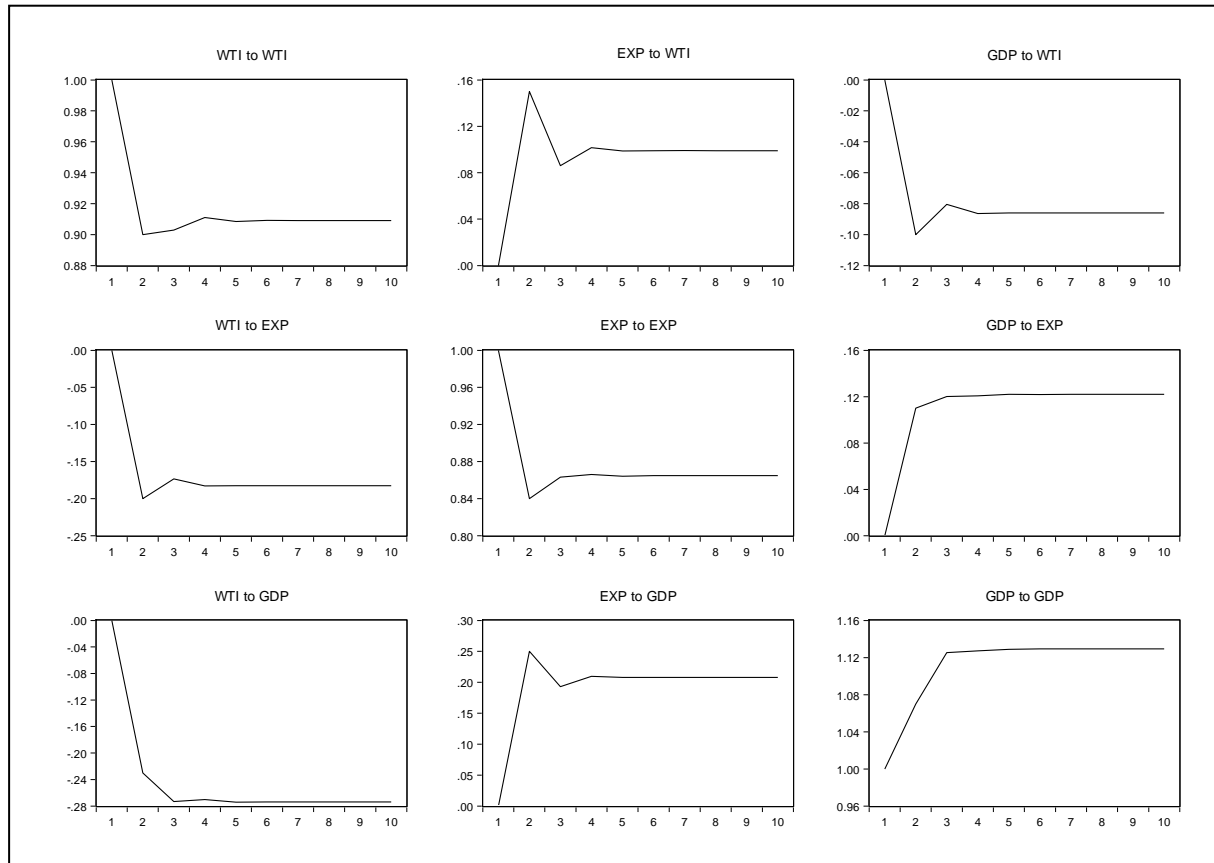

Figure 5. Step function for the WTI (Source: own calculations)

CONCLUSION

It is not necessary to explain how fiscal policy via taxes and expenditure can affect company and its gains. If we sum up all individual effects we get the influence of fiscal policy on economic performance. We can claim that the corporate incomes depend on many factors and the macroeconomic environment is one of them. We can consider the appropriate economic growth to be the main indicator of healthy economy. Undoubtedly, during this dynamic time of sovereign debt crisis, the sustainable fiscal policy and restored economic growth are crucial moments for the next development. Several fiscal measures are expected which should lead to decrease in public debt to GDP ratio. These measures may seem to be unpopular and possible populist parties can gain voters easily. All these facts can lead to increase in volatility of government expenditure and revenues.

Hence, the understanding of the interaction between fiscal variables and economic growth can be useful. It may create competitive advantage among companies and competition is the most important determinant of the economic and social development because it is based on Darwinism.

Thus the aim of this paper is to find-out how long taxation and expenditure changes (temporary and persistent) persist in the economy of developed countries and what is the interaction between fiscal variables themselves and the economic growth like. To achieve the goal, a panel VAR model estimated by GMM was used to construct impulse-response functions. To measure the level of taxation we used two alternative indicators - the standard tax quota (TQ) and the World Tax Index (WTI). Total government expenditures were expressed as a share of GDP. The sample consists of 34 OECD countries in the period 2000-2012.

Particular result suggests that persistence of the temporary fiscal changes influence lasts almost for five years while the economic growth stabilizes on its initial level. The direction of the response of the economic growth on increase in taxation or expenditure is opposite. There were found no significant differences among results of analyzes using the tax quota and the WTI. The persistent increase in government spending leads to increase of the economic growth rate in long-term. The direction of the impact of persistent taxation increase is opposite, again. According to the theory, bigger portion of expenditures might consist of productive ones.

It's interesting that persistent increase in government spending leads to decrease in taxation expressed by both, the TQ and the WTI. The fact can be explained as follows: (i) particular fraction of added expenditures is tax duty free; (ii) the method of creating the WTI consists of combination of soft and hard data which allows for better understanding. When we focus on soft data, tax subjects can subjectively evaluate unchanged gross tax burden as decreasing, if governments provide some higher benefits from higher expenditures without raising taxation; (iii) as Pelagidis and Desli (2004) claim, that increase in expenditures leads to an impact on private capital similar to leverage.

Another interesting result is found in the influence of permanent changes in the GDP growth rates on taxation. Previous works of Kotlán and Machová (2012a, 2013b, 2014a) suggest that the tax quota is an inefficient indicator of tax burden. They explain this by the existence of the Luffer' curve. It implies that trend of development of the TQ should be positively correlated with the GDP growth rates or at least there should be smaller negative effect of increase in the GDP growth on the TQ than on the WTI. Our findings are not consistent with this hypothesis. More interesting it is that results point out some kind of taxation regressivity among developed countries. The higher persistent growth rates of the GDP, the

more they lead to decrease in tax burden in developed countries. This is additional evidence of positive impact of the economic growth on companies' gains.

Our empirical analysis creates valuable tool for companies and individuals to understand the interaction between economic growth and fiscal policy (perhaps, two the most essential factors of global economy nowadays). As we already mentioned in the introduction, knowledge in general contributes to sustainable development the most. From our point of view, any knowledge based company should find our result to be useful for creating expectations about future fiscal measures and their possible impact on the growth. After all these facts, the crucial thing is to distinguish between temporary and persistent changes.

THE IMPACT OF TOURISM ON LOCAL COMMUNITY

Krce Miočić, Božena; Klarin, Tomislav; Vidić, Gabrijela

Department of Tourism and Communication Studies, University of Zadar, Zadar, Croatia

ABSTRACT

Tourism is usually linked to its economic and environmental impact, but not less valuable is its impact on socio-cultural elements. The social dimension of tourism is seen through tourists' staying, movements and interaction with other tourists, as well as with residents of a certain tourist area. The extent and direction of the impact of tourism on residents significantly depend on the level of tourism development in a destination, on inclusion of residents in tourism offer as well as on momentary impact of tourism in the destination.

The aim of this paper is to determine the mutual influence of tourism and local community in a tourist destination. The paper will present the results of a research of the attitude of residents conducted in Zadar County as a tourist destination during 2013. An accidental sample of the residents included 889 examinees belonging to various age groups. The research analyzed the residents' perception of the impact of tourism on Zadar County and their satisfaction with the level of tourism development and tourism offer. The research also determined in which activities the residents are involved in tourism as well as the ways for their future involvement. Moreover, the research identified the direct benefits from tourism for the destination, but also the externals conditioned by them. The conclusion proposes possible directions in reduction of the negative impact of tourism on local community and reinforcement of the positive interaction between tourists and residents.

Keywords: *tourism, stakeholders, local community, impact of tourism*

LITERATURE REVIEW

Tourism dynamics, in line with growing tourist requirements, requires a more quality management and sustainable development of a tourist destination. Tourist destinations are a product of various stakeholders' actions, the main stakeholder groups active in a tourist destination being authorities (state and local authorities), economic sector, local community and tourists (Byrd, Bosley and Dronberger, 2009), with specific interest groups in addition (church, educational and cultural institutions etc.) as well as civil sector (associations, foundations and other organizations). Based on

resources available, stakeholders create an additional value, primarily for tourists but also for themselves. This is what causes a clash of interests, therefore a reconciliation of different stakeholders' interests becomes a key question in destination management (Waligo, Clarke and Hawkins, 2013). Supported by all stakeholders, destination management should responsibly conduct a policy of tourist destination development aiming to produce a quality product, a recognizable image and sustainable development, creating competitiveness and paying attention primarily to socio-economic well-being of residents.

According to present researches, management based on stakeholder concept is very complex and demanding. The concept of management depends on mutual communication, cooperation and understanding among stakeholders, the lack of a functional communication channel being an additional problem (McKercher, 2003; McDonald, 2009; Waligo, Clarke and Hawkins, 2013). Some of the occurring problems are also distrust towards authorities, insufficient support by authorities, involvement of politics, red tape, too big influence of key stakeholders, insufficient involvement of certain stakeholders, insufficient level of awareness of the need for involvement in tourist activities, lack of guidance, incorrectly set priorities, goals and strategies (Hall, 2011; Waligo, Clarke and Hawkins, 2014).

Interactions between tourists and tourist destinations results in changes in these areas and in improvement of tourist attitudes towards the areas they visit. Interaction between tourists and locals is even more obvious, irrespective of the level of locals' inclusion in tourist offer. This contact results in changes in socio-cultural elements of both sides, the changes being positive and negative. Due to the fact that the destination of tourist offer and the destination of tourist demand cannot be separated, and the fact that tourists visit the destination in which they consume a tourism product, tourism has not only economic but also socio-cultural and ecological impacts (Cooper et al., 2008). A number of researches show the differences in perception of examinees/stakeholders of impact of tourism on local community. A research including four stakeholders – government officials, entrepreneurs, residents and tourists showed government officials, among all examinees, have the most positive perception of impact of tourism. Residents indicated a higher level of agreement than government officials on three negative impact items (tourism produces long-term negative effects on the environment, tourism development increases crime, and tourism development increases property taxes). Residents in comparison to the entrepreneurs indicated a higher level of agreement with the statement that tourism development increases crime. Tourists indicated a higher level of agreement than residents in regards to the statement that increased tourism improves the local economy (Byrd, Bosley and Dronberger, 2009). In addition, Sharply found that residents' perceptions of tourism are likely to be influenced by

their pre-existing attitudes or beliefs about particular tourist types and by the nature of social interaction that results from tourists' preconceptions of residents themselves (Sharpley, 2014).

Researches have shown that some of external factors having impact on the perception of local community/hosts of tourism are: economic dependence on tourism, that is whether an individual is involved in any tourism-related activity or owns a tourist facility, the distance of the place of permanent residence to the place of an intense tourist activity, the level of contact with tourists, the use of tourist facilities and tourists – residents ratio. Value variables include community attachment as well as residents' social, political and ecological values. Additional factors influencing residents' perception include demographic structure of residents and features of a tourist destination (Deery, Jago and Fredline, 2012).

A type and level of intensity of impacts of tourism depend on the level of tourist development of an area where tourist activities take place. Therefore, the impact differs with regard to areas which had already reached a high level of tourist development and tourist-developing areas as well as the areas which just examine and plan their tourist development. Diedrich and García-Buades found that local perceptions of benefits increase up to the critical range after which they start to decline (Diedrich and García-Buades, 2009). This is proved by a number of researches which showed how residents' perceptions on the impact of tourism significantly depend on the level of development of a tourist destination. Thus, residents of places with a lower level of tourist development have positive attitudes, which start to decline with the increase of the level of tourist development (Deery, Jago and Fredline, 2012).

RESEARCH METHODOLOGY

The aim of this paper is to examine the way residents of a tourist destination perceive the impact of tourism on the destination and to identify their desire for inclusion in the destination's tourist offer. Zadar County was chosen as a tourist destination because of a permanent growth of tourists' arrivals and overnights in the county with a total of 1 286 811 arrivals and 9 209 069 overnights in 2012 (ZADRA and University of Zadar, 2014).

Tourist density measured by a ratio of overnights and area of Zadar County amounts to 2 525.80 tourist overnights/m², while tourist intensity measured by a ratio of overnights and population of the county amounts to 54.17. A strong seasonality of tourist arrivals with 94% overnights and 86% income from international tourism realized from April to September increases tourist saturation of the area (ZADRA and University of Zadar, 2014). In last decade Zadar made its attraction basis stronger and created new attractions – the Sea Organ (2005) and Greeting to the Sun (2008), which are not only

attractive but they lead to changes in the city's architecture and look as well as they enrich the part of the city which had not been that interesting to tourists and residents.

The survey was conducted by the use of a structured questionnaire consisting of 14 questions, including 4 open questions and additional 18 questions used to define demographic characteristics of examinees and their involvement in tourist activities. The survey was conducted with a constant presence of examiners from April to June 2013 and with a representative accidental sample, consisting of 889 residents of the county, taking part in the survey. The results obtained were processed by the use of methods of descriptive statistics supported by an SPSS statistical package.

RESULTS

The survey examined 889 residents of Zadar County, including 48.5% men and 51.5% women. The majority of examinees included working population (age 15 to 65), only 9.7% examinees were above 66, while younger population was not included in the survey. With regard to educational structure, half of the examinees had secondary education, 34.1% had an associate or a university degree, while 3.5% had a master or a doctoral degree. A high rate of unemployed examinees (11.9%) is lower than the real rate of unemployed residents, which amounts to ca. 20% according to Croatian Employment Service (CES). Since tourism serves a series of economic purposes, the unemployed are expected to support tourism development either in the form of their own tourist activity or as investment decisions of other people, because in this way they improve the possibility for their own employment. A total of 70.5% residents lived in a house, while the rest of them lived in apartments. A specific feature of Croatia is a high level of real estates in possession of residents (82.93%), with a permanent growth of residential area per person (27.2 m²) (Bežovan, 2014). This is significant information when examining the possibility of involvement of examinees in offer of accommodation capacities enabled by their possession of accommodation objects surplus. In Zadar County, household accommodation objects make 61.6% of total capacities (ZADRA and University of Zadar, 2014).

Despite strong preconditions for involvement of residents in tourist offer, they do not have significant economic impacts. More than half of examinees do not have any income from tourism (55.2%). The examinees involved in tourist activities mostly rent their own accommodation objects (26%), 11% of residents offer catering services, 12% offer other tourist services, 5% work in a market. Monthly tourism income amounting to 1 000 € is realized by 38.8% of examinees, while only 6% of examinees realizes monthly tourism income above 1 000 €. Therefore, it can be concluded that tourism is not the basic source of income for residents of Zadar County but it serves to improve their household budget.

Although economic impact of tourism in Croatia is relatively low, the residents' attitude towards the impact of tourism on the state, the county, the place, the family and the individual herself/himself was examined. The residents proved to have a very positive attitude towards the impact of tourism on Zadar County ($\bar{x}=+2.48$), on the Republic of Croatia ($\bar{x}=+2.45$) and on their place of residence ($\bar{x}=+2.15$). A somewhat weaker but still positive impact of tourism, according to examinees, is for them personally ($\bar{x}=+1.50$) and for their family ($\bar{x}=+1.48$), as Table 1 shows.

Influence of tourism on	Very negative y (-3)	Negative y (-2)	Slightly negatively (-1)	No influence (0)	Slightly positively (+1)	Positively (+2)	Very positively (+3)
Croatia	0.3%	0.4%	0.8%	1.6%	7.9%	36.3%	52.8%
Zadar County	0.1%	0.6%	0.1%	1.4%	5.4%	38.1%	54.2%
Place you live in	1.3%	0.5%	0.9%	6.7%	13.7%	37.7%	39.3%
Your family	1.6%	0.5%	0.9%	29.6%	17.0%	30.7%	19.7%
You personally	1.4%	0.9%	1.3%	28.8%	17.2%	29.1%	21.4%

Table 1. *Residents' attitudes towards the impact of tourism*

The level of satisfaction with the development of a place as a tourist destination is related to residents' desire for involvement in tourist offer (Sharpley, 2014). An average level of residents' satisfaction is seen when it comes to assessment of a place as a tourist destination ($\bar{x}=3.67$) and assessment of benefits from tourism in general ($\bar{x}=3.44$). Examinees were neither satisfied nor dissatisfied with the usage of potential tourist destinations ($\bar{x}=2.89$) and tourist activities of private entrepreneurs ($\bar{x}=2.97$). The lowest level of residents' satisfaction (i.e. level of dissatisfaction) is seen when it comes to tourist activities of local and state public authorities ($\bar{x}=2.64$). The results lead to a conclusion that residents express their satisfaction with turning their place into a tourist destination while they express a lower level of satisfaction with the quality of this process in private and public sector. Further involvement in tourist offer is seen in form of residents' renting their own accommodation objects by 36% of those so far involved in renting, 29% of them plan to continue with their involvement, but they do not know in what way, 13% of them will open their own catering facility, and 15% will offer other tourist services. In contrast with them, even 29% of those not involved in the offer so far plan to continue with their non-involvement, 27% do have some plans, but are not sure how to do so, and only 9% of them plan to rent their own accommodation object.

The largest obstacle to tourist development of their place, according to residents, are local government and self-government (26.1%), followed by economic crisis and finances, bad infrastructure and traffic connections (10.5), non-hospitality of residents (10.2%) and a lack of a quality offer (9%). High prices are considered to be an obstacle only for 1.6% of examinees, which leads to a conclusion that examinees perceive the value for money ratio of Zadar County to be set correctly.

Along with positive economic impacts, tourism has also some negative elements. The most significant impact of tourism demand is seen in higher prices of their everyday necessities and prices of real estates and land in a destination. Growth in the number of tourists definitely has an impact on bigger traffic congestion and crowd in general. Environmental pollution is the biggest potential tourism threat, according to majority of examinees (41.6%). The smallest number of examinees recognizes arrival of tourist of other religion and culture as a negative impact of tourism. Such attitude shows how open the residents are toward tourists. It is extremely interesting that a relatively high percentage of examinees express their uncertainty when it comes to assessing the level of deviant behaviour influenced by tourism – growth of prostitution (21.4%), use of drugs and criminal activities (17.1%). However, there are significant differences in perception of those involved and not involved in tourism. Table 2 clearly shows those not involved in tourism significantly more often perceive the negative effects of tourism than those involved in tourist activities.

	Involvement in tourist offer							
	Not involved				Involved			
	Current problem	Not a problem, but could be	Not a problem	I do not know	Current problem	Not a problem, but could be	Not a problem	I do not know
Higher prices of everyday necessities	62.60%	20.10%	12.90%	4.40%	52.00%	33.90%	9.40%	4.70%
Higher land prices	37.90%	29.60%	16.90%	15.50%	29.50%	34.30%	18.10%	18.00%
Crowd	33.40%	19.50%	43.90%	3.30%	31.60%	28.60%	36.50%	3.30%
Environmental pollution	33.20%	35.40%	25.70%	5.70%	23.00%	44.40%	28.00%	4.70%
Noise, especially at night	26.50%	19.50%	50.30%	3.80%	22.90%	27.30%	47.50%	2.20%
Immoral behaviour	20.60%	22.90%	40.70%	15.90%	17.10%	27.30%	41.40%	14.20%
Drugs and crime	18.10%	23.60%	43.90%	14.30%	16.40%	23.50%	44.70%	15.50%
Arrival of tourists of other religion and culture	11.20%	13.80%	63.20%	11.70%	5.90%	14.80%	67.10%	12.30%
Growth of prostitution	8.10%	15.70%	57.10%	19.10%	7.30%	12.00%	63.30%	17.30%
Other	6.20%	1.30%	4.60%	87.90%	4.70%	2.60%	6.20%	86.40%

Table 2. Residents' perceptions of the negative effects of tourism in their places of residence

Table 3 shows residents' desire for a further tourism development and the direction of the development. Most residents expressed their desire for a larger number of tourists in the destination (86.4% completely disagree with the statement "We need no guests", while 56.2% completely agree with the statement "We need more guests"). Different guests are desired by 47.2% of examinees, while a larger number of younger guests is desired by 64% of examinees.

Level of agreement						
	I completely disagree (1)	(2)	(3)	(4)	I completely agree (5)	I do not know
I get closer to the guests	15.5%	13.1%	22.3%	18.5%	27.8%	2.9%
I stay in touch with guests I meet	18.6%	16.8%	20.5%	17.9%	23.6%	2.6%
We need more guests	3.4%	3.5%	12.4%	19.8%	56.2%	4.7%
We need different guests	11.2%	9.3%	19.3%	18.1%	29.1%	12.9%
We need a longer season	3.3%	3.1%	7.9%	11.6%	68.9%	5.2%
I do not want certain groups of guests in my place	42.0%	3.4%	3.1%	4.0%	13.4%	34.2%
I would like to see more younger guests in my place	7.7%	5.4%	15.6%	16.5%	47.5%	7.3%
We need no guests	86.4%	2.4%	2.8%	2.1%	2.6%	3.7%

Table 3. Residents' perceptions of host – tourist relationship

Openness toward all tourists can be seen from the response provided by 45.4% of examinees, who express their disagreement with the statement “I do not want certain groups of guests in my place”. Although a large number of examinees expressed their uncertainty when replying to this question (34.2%), which might be concerning, still a majority of examinees get closer to guests (46.3%), and 41% of them stay in touch with the guests even after they leave the destination.

Furthermore, the connection between the residents' attitudes and the level of involvement in tourist activities was analyzed. The examinees who expressed their agreement with a certain statement, i.e. those with grade 3 or more, were examined. It was found that biggest differences exist with regard to attitudes towards guests between residents involved in a tourist activity and those not involved in it. Thus, those involved in tourism get closer with guests more often (83% versus 59% of those not involved in a tourist activity), they stay in touch with guests (75% versus 56%), but, more than those not involved in tourism, they believe they need different guests (82% versus 73%), and finally, more than those not involved in tourism, they believe they do not want certain groups of tourists in their place (36% versus 23%).

Figure 1. Relationship with guests with regard to examinees' involvement in a tourist activity

According to examinees, the best stimulative element for tourist development is hospitality and openness of residents (18.6%), which are considered to be even more important than the attraction basis of natural beauty of the surrounding (16.7%) and a rich offer of cultural events and entertainment (15.5%). Contact with residents and an experience of autochthonous destination are some of today's basic motives for tourists when they choose a place for vacation. Involvement of residents in tourist offer presents one of basic preconditions for the destination's development.

Figure 2. *The desire for residents' involvement in tourist activities*

Figure 2 shows the level of desire for residents' involvement in tourist offer. Most examinees would like to learn a foreign language (51.3% of them would probably or certainly choose such involvement) and contribute to a better communication with tourists, they would like to take care for their surrounding (52.1%), they would also like to get involved in events presenting old crafts (48.5%) and customs and culinary events (46.2%). Around 40% of examinees will probably or certainly get involved in tourist offer through a form of tourism enterprise including investment in catering and/or accommodation objects or other elements of tourism economy. The smallest number of examinees would like to get involved in folk groups (23.3%).

CONCLUSION

Zadar County presents a tourist destination with a constantly growing number of tourist arrivals and overnights, along with an increase in accommodation capacities. However, residents do not have significant economic impacts despite this development. The residents do recognize an extremely positive impact of tourism on the state, the county, and their place of living and they do express their satisfaction with turning their place into a tourist destination. At the same time, the residents express their lower level of satisfaction with the quality of tourist activities taking place in private and public

sector. They especially express their dissatisfaction with activities of local government and self-government, recognized as the main obstacle to tourism development. Higher prices in all segments of life present the biggest negative effect caused by tourism, according to the residents, while the problem of environmental pollution is recognized as the biggest potential danger in the future. Despite all this, the residents would like to have a larger number of tourists in the destination and believe residents' openness and hospitality are basic advantage of the destination. To realize this goal, the residents are ready to get involved in different tourist activities, such as learning foreign languages, presenting their culture etc. Most commonly, the residents would like to get directly involved in tourist offer through renting their accommodation objects. To retain residents' positive perception of tourism as such and to use their desire for involvement in tourist activities in the destination, local authorities should take over a more active role in tourism and stimulate the processes mentioned.

INTERGENERATIONAL CONFLICT IN THE WORKPLACE: THE INFLUENCE OF WORK VALUE ORIENTATION

Lazazzara, Alessandra; Quacquarelli, Barbara

Department of Educational Human Sciences, University of Milano-Bicocca, Milan, Italy

ABSTRACT

The aim of the present research was to investigate generational differences in work values and intergenerational conflict within organizations. Informed by both the generational cohort perspective and self-determination theory, this exploratory study examined the relationship between work value orientation and perceived conflict among generational groups. Data was collected from a sample (N=213) of employees at seven Italian subsidiaries of multinational companies. The results showed that having an extrinsic, rather than an intrinsic, work value orientation was positively associated with perceived intergenerational conflict. Furthermore, organizational support – in the form of employee recognition and retention – was found to play a key role in reducing perceived intergenerational conflict.

Keywords: *intergenerational conflict, generational diversity, work value orientation, self-determination theory, intention to stay, employee recognition.*

INTRODUCTION

Demographic trends such as workforce aging due to a rapid increase in the older population and later retirement (UN, 2007), together with the widely-held belief that the younger generations hold different work values and different expectations in relation to their jobs and careers (Twenge, 2006), are among the factors challenging contemporary employers and managers, who are required to keep different generations working together for longer while fostering greater interaction among them. Indeed, one of the risks related to the differences in work values characterizing the multigenerational workforce of today is an increase in intergenerational conflict which, in turn, can compromise organizational performance (Dencker *et al.*, 2007; 2008; McGuire *et al.*, 2007; Jurkiewicz & Brown, 1998; Lester *et al.*, 2012). Despite the growing emphasis on understanding differences in values and expectations among generational groups, there is a lack of consensus in diversity management research concerning both the existence of generational differences in work values and the main factors influencing intergenerational workplace conflict. To date, the studies that have addressed generational differences in work values and attitudes have yielded inconclusive results, either because they have

drawn on mainly anecdotal evidence or because they have been affected by methodological weaknesses preventing them from reliably demonstrating whether such differences do indeed exist. In this regard, Giancola's (2006) and Parry and Urwin's (2011) critiques of the notion that there are generational differences in work values, reveal that the evidence supporting this idea is at best mixed, suggesting an unclear and not universally shared classification of work values as differing across the Baby Boomer, X and Y generations. Consequently, if it has not been firmly established that generational groups are characterized by different work values, this weakens the assumption that greater generational diversity within companies can *per se* result in more intergenerational conflict due to differences in work values.

On the other hand, it is undeniable that work values – which are standards or criteria for choosing goals or guiding action and are relatively enduring and stable over time (see Dose, 1997) – have been recognized as key factors influencing motivation, job satisfaction, commitment (Gursoy et al., 2008) and, in broader terms, workers' attitudes toward their jobs (Chu, 2007). More specifically, following self-determination theory (Deci and Ryan, 1985; 2000; Ryan and Deci, 2000), Vansteenkiste *et al.* (2007) recently found that having an extrinsic, rather than an intrinsic, work value orientation was associated with less positive job and emotional outcomes. Intergenerational conflict among employees may be viewed as a type of negative outcome and the focus of the current study was to analyze it from a work value orientation perspective. This exploratory work was designed to address the gap in the intergenerational conflict research by drawing on generational cohort theory (Inglehart, 1977), and introducing self-determination theory (Deci and Ryan, 1985; 2000; Ryan and Deci, 2000) as an explanation for the perception of intergenerational conflict at work that appeals to individual, rather than generational, factors. Our aim was to unpack the effect of having an extrinsic, rather than an intrinsic, work value orientation on employees' perceptions of workplace dynamics by linking extrinsic work value orientation to intergenerational conflict, and to prepare the ground for more research in this direction. In the following section, we outline our theoretical framework by reviewing two existing lines of enquiry into generational cohort theory (Inglehart, 1977) and Self Determination Theory (Deci and Ryan; 1985; 2000), respectively. We then present our own analysis of data collected from a sample of 213 Italian employees. In the concluding section, we discuss how the findings of this study can contribute to the extant intergenerational conflict literature, clarifying their practical and managerial implications. Finally, we analyze the limitations of the current work and suggest directions for future research.

THEORETICAL FRAMEWORK

Generational cohorts and work value orientation

Within the broader framework of diversity management, generational differences in the workplace have been a much debated issue in the academic and practitioner literature over recent years. According to the generational cohort theory developed by Inglehart (1977), a generation is a social construction consisting of individuals born in the same period, who have experienced and have been influenced by the same historic and social context, and who share a common generational identity (Strauss and Howe, 1991). Three different generational cohorts are currently represented in the Western workforce: Baby Boomers (born between 1943 and 1960), Generation X (born between 1961 and 1981), and Generation Y (born after 1982) (Strauss and Howe, 1991). Past studies have suggested that there are fundamental differences in work values among these three generations and that these different value systems impact on individual work-related behaviors (Lancaster and Stillmann, 2003; Smola and Sutton, 2002). However, other studies make the case that it has not been reliably proven that such differences exist (Giancola, 2006; Parry and Urwin, 2011).

Values are intrinsic and enduring viewpoints on what is fundamentally right or wrong and are useful indicators for individual decisions and behaviors (Rokeach, 1973). More specifically, Malka and Chatman (2003) defined work value orientation as “work related reinforcement preferences, or tendencies to value specific types of incentives in the work environment” (p.739). According to Self Determination Theory (Deci and Ryan; 1985; 2000), one fundamental distinction in work value orientation is between extrinsic and intrinsic values. An intrinsic work value orientation reflects employees’ natural desire to learn, develop and grow at the work place (i.e., self-development), to build meaningful and satisfying relationships with colleagues (i.e., affiliation) and to help people in need (i.e., contributing to the community) (Kasser and Ryan, 1993; 1996). An extrinsic work value orientation concerns “the traditional pursuit of success by advancing up the organizational hierarchy to achieve prestige, status, and high income” (Watts, 1992:51). Extrinsic work values focus on the consequences or outcomes of work, such as income, advancement opportunities, and status. In contrast, intrinsic work values focus on the work process itself, on interest in the work in its own right, potential for learning, and opportunities for creativity (Ryan & Deci, 2000).

According to Inglehart (2008), Western European countries experienced a cultural shift from materialistic values to post-materialistic values following World War II. The “theory of cohorts” (Inglehart, 1977) is based on two hypotheses: the scarcity hypothesis, which refers to the tendency of people living in a given country to attribute greater importance to the most pressing needs, and the socialization hypothesis, which postulates that values in any given society change gradually from one generation to the next and that the values of a particular generation are influenced by the prevailing

needs in the years preceding its coming to adulthood. Therefore, during periods of scarcity, materialistic values (e.g., money, economic security, respect for authority) predominate. Conversely, during periods of prosperity, individuals attach increasing importance to post-materialistic values such as autonomy, tolerance, creativity and protection of the environment. However, it is difficult to sum up the empirical results from past research on work values and generations, due to the lack of consensus on the existence of differences in work values among generational groups. Indeed, in the managerial field few authors have found empirical results that clearly distinguish between different generations. On the basis of Inglehart's (1977; 2008) theory, one might expect Baby Boomers to display higher levels of extrinsic work values and younger generations to hold more intrinsic work values. However, counterintuitively, older individuals have sometimes been found to be more intrinsically and less extrinsically oriented (Sheldon and Kasser, 2001; Twenge *et al.*, 2010). In a broader examination of employees' work value patterns, Cennamo and Gardner (2008) reported mixed results, with employees displaying both generational similarity and dissimilarity in terms of work value orientation. Still other studies have found no significant differences in values among generations (Jurkiewicz, 2000; Wong *et al.*, 2008). Given the lack of consensus in the literature just reviewed, our initial hypothesis in the current study was that, in our sample of Italian company employees, we would find no differences among the different generations in relation to work value orientation (H1).

Intergenerational conflict

One of the most common assumptions underpinning the relational demography perspective is that demographic diversity increases both task and relationship conflict (O'Reilly *et al.*, 1989; Pelled, 1996; Pelled *et al.*, 1999; De Dreu & Weingart, 2003). In this sense, intergenerational conflict may be viewed as a specific type of intergroup conflict (Jehn, 1994; Jehn *et al.*, 1997; Jehn *et al.*, 1999; Jehn & Mannix, 2001). However, despite being posited as a key outcome of a workforce composed of different generational groups with different values, intergenerational conflict is a relatively new and under-researched phenomenon in the scientific literature (Dobbs *et al.*, 2007; Dencker *et al.*, 2007).

Studies on intergenerational conflict have mainly drawn on a sociological perspective, taking competition for resources to be a structural aspect of this type of conflict (Turner, 1998). For example, Bourdieu (1993) argued that generations are themselves the outcome of conflict over resources (both cultural and economic) within a specific field. This perspective is founded on the assumption that different generations view different resources as important and that these differences give rise to intergenerational conflict. Access to resources and control over these resources may thus be seen as a means of maintaining generational identity (Eyerman and Turner, 1998). However, as demonstrated by the lack of agreement among researchers regarding clear differences among generations, it is also possible that within a given generation, values and resource preferences may be relatively

heterogeneous and that individual characteristics therefore play a stronger role than generational ones in the perception of intergenerational conflict. On these grounds, we hypothesized that individual rather than generational work value orientation leads employees to perceive a higher level of intergenerational conflict in the workplace. In this regard, numerous studies have analyzed the relationship between holding an extrinsic, as opposed to an intrinsic, work value orientation on the one hand and negative job and emotional outcomes on the other (see Vansteenkiste *et al.*, 2007). Intergenerational conflict may be viewed as a negative emotional outcome that will be perceived as higher or lower depending on whether a person is motivated to gain control over economic and financial resources or not. In this sense, holding an extrinsic work value orientation means that employees are primarily focused on financial success, having control and influence over others and occupying a prestigious position at work. Thus, we expected participants who were motivated by resources to see other generations as competitors in the struggle to obtain resources and, therefore, to be more prone to perceiving a high level of intergenerational conflict in their workplace (*H2a*). On the contrary, we expected employees displaying an intrinsic work value orientation, that is, who viewed their jobs as opportunities to exercise their competencies and skills, pursue personal interests and make meaningful contributions to society and not as a means of obtaining additional resources, to perceive a lower level of intergenerational conflict in their work context (*H2b*).

It is also critical to note that people with internal vs external work value orientations are motivated by different aspects of their jobs and have different work-related reinforcement preferences (Malka & Chatman, 2003). Thus, job and emotional outcomes will also be influenced by employers' and managers' ability to cater for these diverse preferences. When employees feel that their efforts are recognized and consequently perceive their work environment as fair, whatever their generation or preferred style, they will be less likely to perceive any kind of conflict, given that their job will fulfill their needs. Employee recognition is closely related to empowerment and is typically conceptualized as the acknowledgement of employees' accomplishments by managers and as employees feeling that they are heard (Herrenkohl *et al.*, 1999). In general, by specifically reinforcing expected behaviors, leaders signal to employees that their efforts are noticed and appreciated (Luthans, 2000). When employees are recognized and appreciated in their workplace, they perceive fewer real or imaginary threats deriving from the needs of other groups. Therefore, we expected that in our sample employee recognition would be negatively associated with intergenerational conflict in the workplace (*H3*).

Finally, the intention to remain a member of an organization is considered a form of behavioral commitment (Mottaz, 1989) and has been shown to be negatively associated with turnover (Kraut, 1975; O'Reilly *et al.*, 1991). The intention to stay indicates a high level of commitment to the organization and willingness to remain in its employ (Hewitt, 2004), while various forms of

demographic diversity have been found to be antecedents of turnover (Jackson *et al.*, 1991; Wagner *et al.*, 1984). We expected that the participants in our study who intended to stay in their companies would enjoy a satisfactory level of cohesion and integration with their colleagues and, would therefore perceive a lower level of intergenerational conflict in their workplaces (H4).

METHOD

Participants

Data for this study were gathered at seven Italian subsidiaries of multinational companies that were involved in a broader study on generational diversity. We administered a survey to 213 employees - who attended focus group discussions on perceived generational differences - consisting of statements to be rated on a 7-point Likert scale.

Participants were 56% male and equally distributed across the three generations under study (Baby Boomers=33%; Generation X=35%; Generation Y=32%). Their ages ranged from 23 to 62 years, with a mean of 42.3 years ($SD=11.60$), while their mean job tenure was 7.4 years ($SD=8.14$). Fifty-four per cent of respondents were graduates or had a higher-level qualification. Job positions varied as followed: 55% had no managerial responsibilities, 34% were middle managers and 11% top managers. All participants worked in large companies (>250 employees) and 36% were employed in the services sector.

Measures

Intergenerational conflict. Due to the lack of reliable measures of intergenerational conflict, we adapted a single-item measure of overall perceived intergenerational conflict from the practitioner literature (Burke, 2004). We asked our informants to rate the extent to which they perceived intergenerational conflict in their work context using a Likert scale ranging from 1(=not at all) to 7(=to a very great extent).

Generational designations. Three generational groups were defined based on participant age. Specifically, we adopted the birth year classification used in Strauss and Howe (1991:32), placing the respondents in three categories: Baby Boomers (born between 1943 and 1960), Generation X (born between 1961 and 1981) and Generation Y (born after 1982).

Work values. Following Lester and colleagues' (2012) classification of work values and Vansteenkiste *et al.*' (2007) distinction between intrinsic and extrinsic orientations, we identified a set of work-value related items that, following our hypotheses, might be expected to impact on perceived intergenerational conflict. Participants were asked to rate the extent to which six different work values – representing both extrinsic and intrinsic work value orientations – were important to them, using a

Likert scale ranging from 1 (=not at all) to 7 (=to a very great extent). The items a) formal authority, b) structure at work and c) obtaining recognition, concerned valuing organizational hierarchy, status and social approval, reflected an extrinsic work value orientation (Watts, 1992; Kasser and Ryan, 1993; Ryan and Deci, 2000). On the contrary, the items d) respect for plurality, e) work-life balance and f) flexibility, concerned impact on others, altruistic reward and leisure, and were indicators of an intrinsic work value orientation (Deci and Ryan, 2000; Twenge *et al.* 2010).

Employee recognition. Following Herrenkohl and colleagues' (1999) definition of employee recognition we asked our respondents to rate the extent to which they felt they were heard and appreciated by their supervisors and colleagues, using a Likert scale ranging from 1(=not at all) to 7(=to a very great extent).

Employee retention. We adopted the item that scored highest on the scale developed by Kyndt *et al.* (2009), asking participants to rate how strongly they intended to stay with their organization over the following three years on a Likert scale ranging from 1(=not at all) to 7(=to a very great extent).

Control variables. We also asked our respondents to answer some basic questions about their personal and professional characteristics. The control variables were: gender (dummy variable); university degree (dummy variable); role (three dummy variables: non-managerial, middle manager, top manager); job tenure (years).

Analysis

Anovas and post-hoc group comparison were conducted to test Hypothesis 1 regarding generational cohort similarities in work value orientation. Next, a multiple stepwise linear regression was used to determine the relations between the independent variables and the dependent variable.

RESULTS

Descriptive statistics, correlations and reliabilities are presented in Table 1.

	Mean	S.D.	1	2	3	4	5	6	7	8	9
1. Obtaining recognition	4.3	1.5	1								
2. Structure at work	5.3	1.2	.286**	1							
3. Formal authority	5.6	1.0	.229**	.386**	1						
4. Respect for plurality	6.5	.6	-.015	.028	-.012	1					
5. Work-life balance	6.2	.9	.246**	.297**	.114	.244**	1				
6. Flexibility	6.2	.9	.132	-.023	-.042	.243**	.215**	1			
7. Employee recognition	5.6	1.0	.056	.027	.056	.287**	.006	.073	1		
8. Employee retention	5.9	1.1	.011	.191**	.058	.128	.135*	-.037	.256**	1	
9. Perceived intergenerational conflict	3.1	1.5	.169*	.155*	-.014	-.189**	.015	.070	-.333**	-.191**	1

Note. Pearson's correlations: * $p < .05$, ** $p < .01$.

Table 1. Means, standard deviations, correlations and reliabilities (N=213)

Hypothesis 1 posited that the generations would not display differences in work value orientation. A one-way analysis of variance was used to test this hypothesis. The Anovas conducted to compare the three generational groups were significant for only two of the six work values. Specifically, only Respect for Plurality ($F(2;210)=6,05$ $p<.00$) and Flexibility ($F(2;210)=5,13$ $p<.01$) differed significantly across generations. The results of Tukey's HSD post-hoc test indicated that members of Generation Y ($p=.009$) and Generation X ($p=.007$) attached significantly greater value to Respect for Plurality than did Baby Boomers, while Generation Y participants ($p=.005$) rated Flexibility as more important than the Baby Boomers did. These results partially supported the hypothesis that the three generations have similar work-value orientations, except with regard to two of the three intrinsic work values (namely Respect for Plurality and Flexibility).

The multiple stepwise linear regression analysis initially included seventeen independent variables and one dependent variable. During the regression, twelve variables were excluded from the model and the final model was based on five variables that explain the dependent variable perceived intergenerational conflict (Table 2). The model offered an explained variance of 20% ($F=11.200$, $df=(5, 203)$, $p<.001$).

Model	R	R ²	Adjusted R ²	Std. error of estimate	Change Statistics				
					R ² Change	F Change	df1	df2	Sig. f Change
1	.335 ^a	.112	.108	1.434	.112	26.195	1	207	.000
2	.386 ^b	.149	.141	1.407	.037	8.836	1	206	.003
3	.419 ^c	.176	.164	1.388	.027	6.706	1	205	.010
4	.447 ^d	.200	.184	1.371	.024	6.165	1	204	.014
5	.465 ^e	.216	.197	1.360	.016	4.205	1	203	.042

a. Predictors: (Constant), Employee recognition

b. Predictors: (Constant), Employee recognition, Education

c. Predictors: (Constant), Employee recognition, Education, Obtaining recognition

d. Predictors: (Constant), Employee recognition, Education, Obtaining recognition, Employee retention

e. Predictors: (Constant), Employee recognition, Education, Obtaining recognition, Employee retention, Structure

Table 2. Multiple stepwise linear regression: model summary

Concerning Hypothesis 2a, the results showed that two of the three extrinsic work values were positively associated with perceived intergenerational conflict. Higher adherence to the work values Obtaining Recognition ($t=1.868$, $p=.06$, $\beta=.122$) and Structure ($t=2.051$, $p<.05$, $\beta=.137$) predicted greater perceived intergenerational conflict. Hypothesis 2b could not be assessed because all three intrinsic work-values (Respect for plurality; Work-life balance; Flexibility) had to be excluded from the final model.

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	B		
(Constant)	5.966	.800		7.453	.000
Employee recognition	-.433	.101	-.279	-4.272	.000
Education	-.624	.202	-.205	-3.094	.002
Obtaining recognition	.124	.066	.122	1.868	.063
Employee retention	-.263	.095	-.188	-2.764	.006
Structure	.169	.082	.137	2.051	.042

Table 3. Multiple stepwise linear regression: coefficients

A particularly important role was identified for Employee Recognition ($t=-4.272$, $p<.000$, $\beta=-.279$) and Employee Retention ($t=-2.764$, $p<.01$, $\beta=-.188$), both of which were associated with lower perceived intergenerational conflict. Specifically, the high β -coefficients showed that employee recognition and retention were strong predictors of the tendency to perceive intergenerational conflict.

Finally, the control variable Education ($t=-3.094$, $p<.01$, $\beta=-.205$) was negatively associated with the dependent variable. It appeared that those holding a university degree perceived less intergenerational conflict within their company than those with a lower level of educational attainment. We also controlled for generational group effects, testing whether some generations perceived more intergenerational conflict than others, but the results showed that perceived intergenerational conflict was not influenced by employees' generational designation (BB: ref.; X: $t=-.357$, $p=.721$, $\beta \text{ In}=-.023$; Y: $t=-.061$, $p=.383$, $\beta \text{ In}=-.061$).

CONCLUSION

Previous research has provided mixed support for the idea that generations may be defined in terms of different work values and that this can lead to intergenerational conflict. The purpose of the present study was to investigate generational differences in work values as well as to make a first empirical attempt to analyze perceived intergenerational conflict in relation to individual work value orientations. The outcomes of our analysis represent an interesting contribution to diversity management research and bear useful implications for managing a multigenerational workforce.

First, it emerged that significant generational differences do not exist in relation to extrinsic versus intrinsic work value orientations, except for the fact that Generation Y displays stronger intrinsic work values than the Baby Boomer generation. What is more, further analysis (see Lazazzara, 2013) revealed a high level of intragroup heterogeneity within each generation, with other individual characteristics (e.g., role, gender, industry) influencing work value orientation more than generational designation. Secondly, work value orientation was found to play a key role in perceived intergenerational conflict. Specifically, having an extrinsic work value orientation appears to be

related to a stronger tendency to perceive intergenerational conflict, while in the current study it was not possible to assess the relationship between intrinsic work value orientations and perceptions of intergenerational conflict. This means that those who are extrinsically motivated and are focused on financial and social resources see other generations as competitors in this struggle for more resources and, therefore, perceive more threats related to the coexistence of different generational groups within the workplace. Third, the results also pointed up the vital importance of organizational support in preventing intergenerational conflict. Employee recognition and retention were found to be critical intervening variables implicated in reducing perceived intergenerational conflict. In other words, appropriate management styles that respect individual reinforcement preferences can diminish the risk of intergenerational conflict.

The limitations of the current study need to be taken into account when interpreting the results. Caution should be used when generalizing from our findings. First, we used a convenience sampling method to recruit employees working in multinational subsidiaries based in a specific Western country, so our sample is representative of a very specific cultural context and of highly specific occupational situations. Additional data collection is recommended to test whether these findings may also apply to other contexts. Second, we used a cross-sectional research design that does not provide any insight into causal relationships. Further longitudinal studies might also assess causal patterns among the variables. Another limitation stems from the use of self-report and single-item measures, especially with regard to the dependent variable. We recommend the development of a more reliable scale to measure the construct of intergenerational conflict, as well as further studies examining how intergenerational conflict might be explained by self-determination theory.

Despite these limitations, our study has multiple practical implications. First, it strongly suggests that adopting managerial styles and HRM practices that meet individual needs and preferences would be an effective strategy for reducing intergenerational conflict at work and fulfilling employee needs. Moreover, diversity management would benefit from changing its approach to the analysis of generational issues by emphasizing the similarities, rather than the differences, among generations and leveraging these commonalities to promote a collaborative work environment.

CORPORATE SOCIAL RESPONSIBILITY AND CORPORATE REPUTATION IN THE FINANCIAL SECTOR OF DEVELOPING COUNTRIES

Lizarzaburu, Edmundo R.

Universidad ESAN¹², Jesus del Brio, Universidad de Oviedo

ABSTRACT

This research seeks to study the influence of Corporate Social Responsibility (CSR) on the reputation of a corporation from a strategic point of view. The literature review suggests the absence of this type of study for the banking sector in emerging countries. In this sense, this research seeks to contribute to a better understanding of the CSR effects on the corporate reputation (CR) in the banking sector in Peru. By using the methodology of the case study, the four most relevant banks in Peru have been analyzed representing 25% of all participants of the banking system in Peru and 80% in the participation of three financial indicators: % credits, % deposits and % patrimony (equity) and, it has been detected that CSR could affect both corporate reputation (CR) and the investor's confidence. In addition to this, it has been found that CR could act as a moderating variable between CSR and the investor's confidence. Peruvian banking companies have improved their reputation due to their social responsibility actions. This improvement of reputation has been correlated with a strengthening of enterprise value. Likewise, the analysis of each of the cases, within the scope of the plans of CSR, seven propositions were detached classified in three relations (CSR and investor confidence, CSR and corporate reputation, and corporate reputation and investor confidence). The novelty of this work is twofold. The literature has analyzed the concepts of CSR and CR in an isolated manner. After a thorough review a model that relates the two concepts is proposed. Secondly, the model is used to pose hypotheses of the relation CSR and CR in financial sector companies in developing countries. Research in this topic has been done mostly in production enterprises and in developed countries.

INTRODUCTION

The research on corporate social responsibility (CSR) has evolved in time and currently has positioned itself as one of the pillars of analysis in the scope of business organization. In recent years, corporate social responsibility (CSR) has received increasing attention from companies, the financial community, regulators and policymakers (Bouslah et al., 2013). From the academic point of view, various studies have addressed its importance in the economic benefits of the company and in the development of the community. In addition, as shown by the empirical evidence, the CSR actions have an impact on the company's reputation (Knox and Maklan, 2004). It is therefore important that the *company's stakeholders* not only consider the corporate social responsibility within their strategic plans but also consider the corporate reputation (CR) as a variable that can be influenced by the decisions of the CSR.

When reviewing the literature, different lines of research that address separately the study of the CSR and CR have been found. Also, the existence of a limited set of investigations that relate both theories has been confirmed. Few banking theories are related to CSR. One way to incorporate CSR with banks is to relate the role of the bank's reputation (Wu and Shen, 2013). In the theoretical model of Chemmanur and Fulghieri (1994), for example high-reputation banks are shown to have incentives to perform the pre-loan more rigorous evaluations of unobservable prospects borrowers compared to banks with low reputation. Also, Bushman and Wittenberg-Moerman (2012) document that high reputation banks are associated with variables such as profitability, credit quality of accounting data reported by borrowers. Far less are even the empirical studies that analyze CSR and CR in conjunction and the relationships between them. This scarcity represents a gap in research on this topic.

The purpose of this document is to overcome both the theoretical and empirical research gap existent in the CSR and CR. To do this, in the first place, it shows the state of art with respect to the existing research on CSR and the CR by focusing on those *papers* that address these theories separately. In section three an exhaustive review of the research that analyze jointly CSR and CR to propose a theoretical model that relates both concepts is performed, besides it is include the investor's confidence. The investigations in this field, especially those of empirical nature, are oriented toward developed countries and to productive sectors. The objective of this paper is to apply the theoretical model proposed that relates CSR and CR to companies in the financial sector in developing countries through an analysis of cases. There is no knowledge, up to where the revision of the authors has reached, that this analysis has been performed previously. Therefore, we hope that the results of this research will contribute to a better understanding of the effects of CSR on the CR in other different contexts other than their own of developed countries.

THEORETICAL FRAMEWORK AND LITERATE REVIEW ON CORPORATE SOCIAL RESPONSIBILITY AND CORPORATE REPUTATION.

In literature, the theories of CSR presents four common dimensions (Garriga and Mele, 2004): benefits of CSR in the companies, the political performance of business in society, the social demands on CSR and the ethical values. Under this premise, you can sort the theories of CSR in four blocks according to the emphasis that each one of them makes in any of the four dimensions: instrumental theories, political theories, integrative theories and ethical theories.

Research within the instrumental theories includes those authors who consider the company as a tool for wealth creation and its social activities as a means to achieve economic results. Companies are now opting for a ethical and responsible behavior to the extent that such behavior provide competitive advantages to the business. There are three subgroups within these theories which are distinguished by the proposed economic objective. The first one considers that the goal of the CSR is to maximize the value of the shareholder, as measured by the share price (Friedman, 1970; Jensen and Meckling, 1976; Jensen, 2000). The second considers that the goal of the CSR should be to reach different sources of competitive advantage (Teece *et al.*, 1997; Husted y Allen, 2000; Hillman and Keim, 2001; Petrick and Quinn, 2001) or to have an incidence on the results of the company (Prieto *et al.*, 2014) or at least an stakeholder can differentiate between initiatives that align with the interests of business and society (Goss and Roberts 2011). The third proposed that the objective of the CSR is to extend the effects of marketing (Varadarajan and Menon, 1988; Smith & Higgins, 2000).

The second block of research is made up by the authors that develop the political theory. This theory refers to the effects of the excessive power of business in society and the benefits of a responsible exercise of that power in the political arena. Within the variety of approaches, three are considerable: the corporate constitutionalism, the theory of integral social contract and corporate citizenship. Corporate constitutionalism (Davis, 1960 and 1967) considers that the company is a social institution that has the power (social power), which must be used responsibly. The theory of integral social contract (Donaldson, 1982; Donaldson and Dunfee, 1994, 1999) take into account the socio-cultural context and also normative and empirical aspects of management in a comprehensive manner. Under this theory, the social responsibility comes from the consent of the society. Finally the corporate citizenship analyzes the activities of the company to be considered legitimating before society (Davis, 1973; Altman and Vidaver-Cohen, 2000; Matten et al., 2003).

Another block of research refers to the integrative theories that study the identification, channelization, training and response of firms before the social demands of the stakeholders. Four distinct lines of research are differentiated.

The first deals with the social responsibility from a point of view of management (Sethi, 1975; Wartick and Rude, 1986; Greening and Gray, 1994) suggesting that the gap between the expectations of society over the company behavior and the actual behavior of the company is crucial for managing the company's CSR. The second theory, proposed by Preston and Post (1975, 1981), define the principle of public responsibility as company policies that is not only based on the law and regulation, but also in broad pattern of social direction reflected in public opinion, formal legal requirements and implementation practices also Bouslah et al., 2013 establishes the relationship between the performance of the business and business risk. The third theory focuses on the possible effects that business decisions can have on other interest groups in society (Rowley, 1997; Agle *et al.*, 1999; Berman *et al.*, 1999). Finally, the fourth theory is the corporate social performance that seeks to integrate certain aspects of the previous theories and, moreover, it includes research on the social legitimacy (Carroll, 1977; Wood, 1991).

Finally, the fourth approach of theories of CSR are the ethical theories that are studying the ethical responsibility of enterprises to society and are grouped into four approaches: the normative theory of the *stakeholders*, the universal rights, sustainable development and the approach of the common good. The normative theory of the *stakeholder* begins with Freeman (1984) and is based on the fact that the interests of all *stakeholders* are of intrinsic value, i.e. each group of *stakeholders* deserves credit for its own sake and not necessarily because of its ability to promote the interests of any other group. The theory of the universal rights believes that human rights is the foundation of the CSR (Cassel, 2001) emerging from here approaches such as the Global Compact. The theories of sustainable development were originally aimed at environmental issues (Russo and Fouts, 1997). However, this concept has been developed over time and has been including other factors such as the social (World Business Council for Sustainable Development, 2000). Finally, the approach of the common good argues that the company, like any other social group or individual in the society, has to contribute to the common good, because it is part of society (Carroll and Savannah, 2010). In that sense this approach argues that the company is a mediating institution.

With regard to corporate reputation (CR), in the literature there is a range of definitions, and all of them share a common element: that the expectations and perceptions of the *stakeholders* involved with the company determine its degree of reputation (Ferguson et al., 2000; Fombrun and Van Riel, 2002; Chun, 2005). It is expected that the different *stakeholders* have different interests and different expectations, so the corporate reputation will depend on the crossing of these expectations with the real-world experiences resulting from compliance or noncompliance with the commitments made by the company.

In line with the above, the CR will be the result of confronting what the company is committed to do, with what it really does and with the opinion of the *stakeholders* in this regard. This means that the company must align the CSR with its objectives, its declared values, with its behavior and expectations of the *stakeholders*. Following Chun (2005) it is possible to identify three types of schools of thoughts about CR: evaluative, impressional and relational. The main difference between these schools lies in the *stakeholders* that are taken into account as a focal point in assessing the CR.

Evaluative school considers reputation as a competitive advantage for its interference in the financial value or by the short-term financial performance of the company (Williamson, 1985; Barney, 1991; Grant, 1995; Deephouse, 2000; Kotha et al., 2001; Bromley, 2002; Williamson, 2002; Eberl and Schwaiger, 2005). In this scenario, the relevant stakeholders are the shareholders, the managing director and the chief investment (Srisvastava et. al. , 1997).

The impressional school focuses on the emotional association of stakeholders with the company, which will influence on the financial performance in the long term. Under the perspective of this school, three factors explain the CR, the image, the identity and legitimacy (Dowling, 1993; Brown *et al.*, 2005 ;). Also, this school believes that the reputation is evaluated as the perception of the employees and consumers instead of some financial indicator, as is the evaluative school. The relational school maintains that the corporate reputation includes the internal perspectives of the *stakeholders* (identity and desired identity) and external (image). These three elements represent the core of the relational school (Hatch and Schultz, 2001; Davies and Chun, 2002; Chun and Davies, 2006).

Table 1 summarizes the contributions of the literature about the corporate social responsibility and corporate reputation, evidencing the absence of traslational researches between both of them, implying the existence of a breach within the research.

RESEARCH BREACH

Research in CR

1. Evaluative school

The reputation is important due to its interference in the financial value or the short-term financial performance of the company (Barney, 1991; Hall, 1992; Grant, 1995; Dunbar and Schwalbach, 2000; Sabate and Puente, 2003; Eberl and Schwaiger, 2005). In this scene, the relevant stakeholders are the stockholders, the General Manager, and the Investment Head (Srivastava et. al., 1997).

2. Impressionist school

Emotional association of the stakeholder with the company (Balmer, 1997; Brown et al., 2005; Dowling, 1993; Yoon et al., 1993; Weiss et al., 1999; Dutton et al., 1994). Three elements explain the corporate reputation: imagen, identity and legitimacy.

3. Relational school

Corporate reputation includes the perspectives of internal stakeholders (identity) and external (image) (Davies and Miles, 1998; Hatch and Schultz, 2001).

Elaboration: Authors

TRASLATIONAL RESEARCH ON CSR AND CR AND RESEARCH MODEL

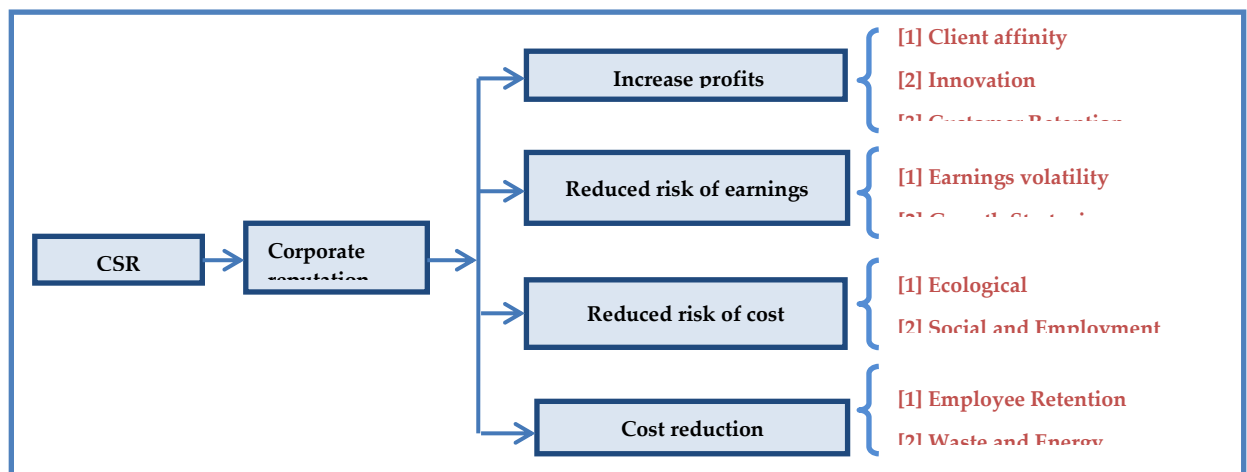

The reputational risk can be defined as the possibility of loss or decline in the reputation of an organization. This loss of reputation affects the perception that the social environment has on the company producing a direct or indirect loss in the value of the company (Rayner, 2003; March and Shapira, 1987; Bebbington, 2007). The reputational risk can be situational or planned. The situational is characterized by being immediate, that is to say, it is impossible to anticipate CSR actions

on it to control the situation. In the reputational risk provided the company can anticipate actions of CSR with the purpose of minimizing the consequences. For example, a company that plans the closure of a plant will carry out communication campaigns with sufficient time to explain the reasons and try to minimize adverse reactions.

According to the above, the corporate social responsibility has an impact on the risk of reputation provided. Since the reputation of the company depends on the perceptions of the *stakeholders*, then each of them is a source of risk that the company has to manage through plans of CSR. In addition, the company must manage its relations regarding these interest groups (Pfeffer and Salancik, 1978; Turban y Greening, 1997; Wagner et al. , 2009).

The CSR is part of a cycle through which companies generate capital of reputation, managing reputational risk and improve their performance. Companies invest in corporate social responsibility, which generates a capital stock of reputation which is used for two purposes: on one hand, it represents a launching pad for future opportunities and, on the other hand, safeguarding existing assets, acting as a damper against losses. Through the CSR programs it gives consistency to the cycle and manages the risk of reputation. According to Knox and Maklan (2004), the ultimate effects of CSR on corporate reputation can be divided into four categories: profit, risk associated with the loss of profits, cost and risk reduction of costs (Figure 1).

Figure 1: Effects of the relationship between CSR and corporate reputation

Source: Knox y Maklan (2004)

As a result from the review of the literature about the traslational research between CSR and CR there are three main conclusions. The first is that the corporate social responsibility could have positive effects on the company's reputation (Newgren et al.,1985; Bromiley and Marcus, 1989; Brown and Perry, 1994; Klassen and McLaughlin, 1996; Graves y Waddock, 1997; Wright & Ferris, 1997; Moore, 2001; Hill et. al. ,2003). This finding is not only theoretical (between the different conceptual approaches), but also empirical. However, it has been found that the research in this field are geared

mainly to developed countries. This is important because it opens up a line of research that involves the application of the theoretical framework of the CSR and CR in developing countries.

A second conclusion is that among the different approaches of corporate reputation, one that emerges as the one that considers the perceptions of all *stakeholders* is the relational school (Hatch and Schultz, 2001; Davies and Chun, 2002; Chun and Davies, 2006). This is important because it lets you relate it to the integrative theories of the CSR. From the literature review it was found that in this aspect the relationship between the CSR and the CR has not been addressed from a point of view of *stakeholders*. This, for example, is important to production and financial sectors in developing countries.

A third conclusion is that of the reviewed studies it is found that the main reason whereby the company maintains CSR plans and improves their level of CR is because both variables will yield greater economic benefits (Newgren et al., 1985; Brown and Perry, 1994; Klassen and McLaughlin, 1996; Graves and Waddock, 1997). In line with this, studies that quantify the impact of the CSR and the CR on the benefits of the company or of the relationship between the two on the business benefits have not been found.

As a result of these conclusions, a research model that relates the CSR, the corporate reputation and the confidence of the investor is proposed in this investigation. In the following graph the major variables of study and their relationships between them is outlined. In the first place, it is expected that the CSR plans undertaken by the companies positively influence on the investor confidence and on the corporate reputation (Newgren et al., 1985; Bromiley and Marcus, 1989; Brown and Perry, 1994; Klassen and McLaughlin, 1996; Graves and Waddock, 1997; Wright and Ferris, 1997; Moore, 2001; Hill et.al.,2003). Secondly, it is expected that the corporate reputation could increase investor confidence (Orlitzky *et al.*,2003; Margolis et. al. , 2007; Wood , 2010). In addition, the role of the corporate reputation will be evaluated as a moderator variable of the relationship between CSR and the confidence of the investor (Klassen and McLaughlin , 1996; Graves and Waddock, 1997; Knox and Maklan, 2004) in order to support the research model showed in figure 2.

FIGURE 2: Research Model

Elaboration: Author

METHODOLOGY

This research employs the methodology "case study" to produce a inductive reasoning and from the study, the observation and data collection to establish hypotheses or theories to contrast the proposed research model with large samples. In literature various classifications of the case studies are distinguished. However, two of them are considered principal: the classification of Williams (1987) and the classification of Stake (1994, 1995). Williams (1987) considers that the case study has four types: illustrative, exploratory, cumulative and critical. While Stake (1994, 1995) considers three types of case study: study of intrinsic case (only case), instrumental study of cases and study of collective cases (multiple cases). In this investigation it was opted to follow the classification of Williams (1987), and in particular the "*cumulative case study*" has been elected. This choice is justified by three arguments: the first is that we want to analyze the plans of CSR in a transversal manner between the participants of the selected sample, this is in response to the interest in obtaining similarities and differences in the CSR among the studied cases. The second is that the taking of various cases strengthens the research by means of more information on the studied variables. Finally, the third reason is that it not only allows you to describe each case but also make possible inferences of the analyzed cases more rigorously. The study of collective cases (cases multiple) proposed by Stake (1995) presents some similarities with the cumulative case study by Williams (1987). However, the latter was chosen because it considers the information available not only at a particular point in time but over a period of time that the investigator considers to narrow the research, which would provide more information. In this regard, for this research it is being considered the available information from 2005 to 2013.

4.1 Choice of the sample

The novelty of this paper is to apply the model of relational research between CSR and CR to developing countries and to the different sectors of manufacturing. According to Schumpeter (1912), the well functioning of financial institutions such as banks, through technological innovation, allows companies to increase their chances of successful introducing innovative products and production processes. Therefore, a healthy banking system is the key to sustained prosperity (King and Levine, 1993). Similarly, banks also played an important role during the last credit crisis (Wu and Shen, 2013). It is important to note in this line, that the banking system plays an important role in economic development (Levine, 2005; Shen and Lee, 2005) due to its safety and soundness create several external benefits to society. Therefore, the research is defined to the study of cases of companies belonging to the Peruvian banking system, which is formed in 2012, by sixteen banks (Banco de Credito del Peru (BCP), Banco Continental (BBVA), Scotiabank Peru, Interbank, Banco Interamericano

de Finanzas, Mibanco, Banco Financiero, HSBC Bank Peru, Citibank, Banco Falabella Peru, Peru Banco Santander, Banco de Comercio, Ripley, Banco Azteca Peru, Banco Cencosud, Deutsche Bank Peru). Of this universe a representative sample is selected by choosing a set of financial indicators that provide you with the necessary criteria to discriminate sample members.

Between the different financial indicators available three have been chosen: involvement of the company in the credit market, in the market of deposits and in the assets. Its justification is that the selected indicators reflect the income of the banking company, the source of funds and the financial health crises.

The first (% credits) indicates the percentage of loans of the bank with respect to the total in the banking system and reflects, to some extent, the market power of the banking companies. The second (% deposits) shows the market participation of funds and the third (% patrimony) reflects the own capital of each bank in comparison with the total of the banking system. The latter is important because it explains the financial strength to cope with unexpected losses. The sample shall consist of those banking companies that together, they have a participation above 80 %. Figure 3 shows such indicators for the banking system in 2012.

It is noted that the Banco de Credito del Peru (BCP) has the largest market participation in credits, deposits and in net patrimony (equity) with regard to the total of the banking system. Secondly, there is the Continental Bank (BBVA), leaving in third and fourth place Scotiabank Peru and Interbank respectively. Also, in the graphic on the right it is noted that these four banks, as a whole, have a participation of more than 80% in the three proposed indicators. This suggests that the sample will be composed of these four banks, which represent for 25 percent of all participants of the banking system.

Figure 3: Participation of the banking companies in the financial market

Source: Superintendency of Banking and Insurance

The selection of the cases under the three financial indicators, where such cases have a representativeness -in the banking system - above the 80 percent; and that the selected cases represent a 25 percent of the population, respond to the objective of generalizing the findings in this sample to the universe as a whole in line with Eisenhardt (1989). In each of the cases we analyze three comparative fields, strategic goals, interest groups and actions taken. This allows to arrange the information contained in each case to then make proposals and inferences.

DESCRIPTION OF THE CASES

Banco de Credito del Peru (BCP)

The BCP conceives the CSR as the way to satisfy the economic, environmental and social expectations of the interest groups that are related to the objectives and functions of the Bank. To give organizational content to this philosophy, it creates the area of Social Responsibility (SR) in the year 2008 within the Corporate Affairs Division, in order to manage the expectations of its stakeholders through ethical and responsible actions that promote the economic sustainability of business, and to incorporate social and environmental aspects to its management. The following table summarizes the main elements of the CSR in BCP.

Elements of the	Description
CSR	
[1] Strategic objectives	<ul style="list-style-type: none"> - Understanding the expectations of the groups of interest. - To strengthen the commitment of the partners with the business and with the activities of SR. - Promote financial inclusion in disadvantaged communities of Peru. - To promote the development of childhood and youth through education and sport. - Be environmentally responsible. - Encourage financial education and culture
[2] Interest groups	<ul style="list-style-type: none"> - Shareholders, Partners, - Community, opinion leaders and customers.
[3] Actions undertaken	
3.1 Education	<ul style="list-style-type: none"> - BCP is the nation's leading sponsor of Mathematics for all project, to arouse interest in schoolchildren for mathematics and strengthen their learning. <u>Beneficiary:</u> 59,460 schools, 38,822 educational materials delivered, 1,148 trained teachers, 115 schools which benefit in 15 regions of the country - BCP gives an Integral scholarship for undergraduate studies in Peru to the first place of the promotion of the School Mayor Presidente del Peru, and financial support throughout their years of study. - BCP signed the first agreement of cooperation with the Faculty of Statistics at the Universidad Nacional de Ingenieria. <u>Beneficiaries:</u> 2 integral scholarships granted with 10,000 annually to the scholarship students and 20 preferential loans placed.
3.2 Infrastructure Works	BCP supports the Peruvian state in infrastructural issues through the mechanism of "works by taxes". In 2012, BCP financed the project of "Expansion and improvement of the potable water system and construction of the sewerage system in Centro Poblado La Encantada" in Piura. In addition 12 million has been made in public investment with 4,000 winners and 670 residential connections.
3.3 Volunteer	Led by partners, through ten committees at the national level. <u>Beneficiaries:</u> 857 volunteers mobilized, 2,516 voluntary participations, 5,164 beneficiaries, 28 activities undertaken, 20 emergency shelter built.

In addition to the three types of plans of CSR that BCP has implemented (education, infrastructure, and volunteer work), the bank has focused its efforts to promote the development of small and medium-sized enterprises (SMEs) and the development of the tourism sector. In regard to the

development of SMEs, BCP implemented CSR-oriented plans to increase the competitiveness of companies operating in the textile-clothing sector (Lima). In these plans CSR worked with 500 SMEs to enhance production processes and quality, direction and management of business, access to new markets, and design of quality clothes and accessories. On the other hand, in the tourism sector, BCP conducted trainings and technical assistance so 50 lodgings and restaurants located in the Moche Trail (Trujillo), could obtain the CALTUR stamp of the Ministry of Foreign Trade and Tourism.

Banco Continental (BBVA)

The policy adopted by BBVA Continental in the areas of corporate responsibility follows the general trend of all the financial institutions that make up the BBVA Group: define decisions and actions to promote those that involve all the interest groups in the generation of social value and directly involving the Group in the generation of economic value and reputation.

Since 2008, BBVA Continental has a Committee of Corporate Responsibility and Reputation, which meets periodically to monitor and evaluate the most relevant issues that are proposed in this area. Meetings are led by the Managing Director of the bank and have the assistance of members of the Management Committee and the Manager of Image and Communication, responsible for the execution of actions in the CSR. The following table summarizes the main elements of CSR of BBVA.

Elements of the CSR	Description
[1] Strategic objectives	Financial Inclusion and financial education and culture.
[2] Interest groups	-Shareholders, Partners, -Community, opinion leaders and customers.
[3] Actions undertaken	
- Program: "Reading is to stay ahead"	This program allows large number of teachers and students, in eight regions of the country, to achieve the objectives of increasing the rates of reading and to improve the levels of understanding among the Peruvian students. Currently the bank is implementing this program in 8 regions of Peru: Ancash, Arequipa, Ayacucho, Ica, La Libertad, Lima, Loreto and Piura. The program has four lines of action:
	Materials: The program has developed textbooks for the students and teaching guides for teachers in agreement with the intervention area.
	Training: The program strengthens the teachers in a set of conceptual, pedagogical and

methodological abilities for the teaching of reading comprehension.

Measurement of learning: The measurement of component programming seeks to analyze the effectiveness of the intervention of the program from the point of view of the change in the performance of students in the area of reading comprehension.

Institutionalization: The transverse component of institutionalization seeks to strengthen the efforts and local initiatives and macro-level related to reading comprehension. To do this an Agreement of Interinstitutional Cooperation with the Ministry of Education has been signed since the beginning in order to contribute from the program design to the national education policy.

Scotiabank Peru

Scotiabank integrates internationally Corporate Social Responsibility in all their daily activities. CSR priorities established by the Head Office are aligned in a five-point strategy: (1) Sustainable and profitable growth of the business, (2) Management of the capital and the balance sheet, (3) Leadership, (4) Prudent risk management and moderate appetite for it, and (5) Efficiency and expense management. Also, Scotiabank believes that the CSR is a vision of business committed to ethical values, people, environment and communities. This behavior contributes to sustainable development, considers the stakeholders and complies with the laws.

In order to manage the CSR, the bank has developed "The Social Responsibility Strategic Plan", which was formulated with a time horizon of five years, from 2009 to 2014. In the following table are mentioned the strategic objectives, interest groups and the main actions of CSR that the bank has implemented in Peru.

Elements of the CSR	Description
[1] Strategic objectives	<p>(1) Join the CSR transversely throughout the Bank. Includes development of management tools.</p> <p>(2) Integrate external interest groups in the actions of CSR (customers and suppliers).</p> <p>(3) Exercise social and environmental leadership.</p> <p>(4) Spread the actions performed in the society in terms of Social Responsibility.</p> <p>(5) Financial education.</p>
[2] Interest groups	Shareholders, customers, partners, suppliers, environment and community.
[3] Actions undertaken	
Improvement of income and food	Scotiabank Peru and Care help families, especially the women of the

security with women in Santa Teresa - Cuzco Phase II	microwatersheds, to improve their income and food security. This is part of the project Good Local Governance and Corporate Social Responsibility to improve the quality of life for women and children in the Andean Watersheds.
Building capacities for the financial and social inclusion of low-income families in Piura, Ica and Huancavelica	The objective is to repeat the methodologies and strategies developed in Santa Teresa, including innovations and the outcome of the lessons learned. Expected results: 2 thousand low-income families generate their income in a sustainable manner, as more than 1,800 children under 3 years old will improve their state of health and nutrition. 27 educational institutions achieve quality of teaching.
Access opportunities to higher education and volunteerism in Callao (marginal urban areas)	This project is being implemented in strategic alliance with COPRODELI and has two components: Component 1: Scholarship Fund and Educational Credit aimed at school children and graduates for entrance and studies in higher centers. Component 2: Actions of transfer of skills through volunteering
School Program EcoBusiness	Support for the program of environmental education and entrepreneurship created by IPES (Institute for the Promotion of the Social Economy), aimed at young school children between 14 and 16 years old. It has expanded to 100 participating schools, with training to 100 teachers in the areas of science, technology and environment and Education for Work and to 461 students in business plans, budgets and team work.
Implementation of drinking water systems and sanitation in vulnerable areas	The NGO "Agualimpia" facilitates coordination between local governments, regional governments, the private sector and communities to implement self-sustaining systems of drinking water and sanitation in vulnerable areas of Peru. Between the years 2007 and 2012, Scotiabank Peru has conducted participatory work with twelve local governments and 46 sanitation projects.

As noted in the chart above, Scotiabank has implemented a set of programs of CSR, which respond to a strategic plan. This suggests that in the future this Bank will continue to strengthen its programs in such a way that they are sustainable over time.

Interbank

Interbank has tried to differentiate from their peers as a bank based in people and a value-based organization. In this sense, the company has undertaken several projects that have sought to foster human development within and outside the bank. In the following table are mentioned the strategic objectives, the interest groups involved and the main actions undertaken under the concept of CSR.

Elements of the	Description
-----------------	-------------

CSR		
[1]	Strategic objectives	Education, financial inclusion and environment
[2]	Interest groups	-Shareholders, Partners, -Community, opinion leaders and customers.
[3]	Actions undertaken	
Graceland		Is the program of Interbank intended to transmit to all the collaborators, the culture of the bank through an experiential methodology of values who seek to form better people before better bankers. At Graceland all the staff of the bank are involved regardless their position or hierarchy in groups made up of members from all areas of the institution.
Program Terrain"	"All	This program seeks to facilitate access to financial services to the employees of the firms that operate in rural areas, agricultural and/or difficult to access. This program involves the installation of financial shops, Global Net ATMs and coin compartments and even correspondents as Interbank Agent within companies to facilitate the payment of remuneration by allowing workers to gain quick and safe access to their holdings, as well as to give workers the possibility to pay their services. In addition, this program benefits the employer in the reduction of costs in the treasury management.
Program Teacher Leaves a Mark"	"The who	This program is a contest that recognizes the contribution of teachers in improving the quality of education. "The Teacher who leaves an impression" is a social initiative that promotes and recognizes the effort and innovation in teaching in favor of national education, this initiative, started from the year 2007, and is being supported by the Ministry of Education.

DISCUSSION

Of the cases of the previous section some propositions are released, which are grouped under three relations.

6.1 CSR and investor confidence

In the banking cases analyzed it shows that one of the main stakeholders of the strategic objectives are the investors and/or shareholders. This clearly responds to that the company wants to provide signs of financial health in order to create confidence in investors. This confidence is important to avoid, on one hand, that the current investors withdraw their funds from the company and, on the other hand, for future investors to decide to reorient its cash flows toward the banking company. This is in line

with findings by Newgren *et al.* (1985), Brown and Perry (1994), Klassen and McLaughlin (1996), Graves and Waddock (1997). These authors argue that the plans of CSR influence indirectly in the value of the company by means of the increase in the price of the shareholders, which improve because of the confidence of investors. It is noteworthy that the study of these authors is within the scope of real sector companies but not financial. In consequence, with all of the above, there is the following proposition:

Proposition 1: *Corporate social responsibility could have a positive influence on investor confidence.*

It was also noted that part of the CSR plans involve the workers of the company that implement such plan. For example the program of "Volunteerism" of BCP, which is led and managed by the collaborators, through ten committees nationwide. This program involves the collaborators with the community in sessions of infrastructure construction, dictated by workshops in business management, and design and implementation of projects developed by the staff of BCP.

The objective of this program is to strengthen the bank's presence in various areas of Peru through a "personalized" approach by BCP workers to the members of the community. It is anticipated that these programs not only improve the perceptions of stakeholders in the community about the bank's shares, but also increase the commitment of workers in BCP and therefore increase labor productivity. The latter is a good sign for investors, since higher labor productivity could lead to greater economic benefits. This is in line with the instrumental approach to CSR, specifically that sustains that the CSR plans must be oriented to create competitive advantages, which should be based on resources and dynamic capabilities; being the workers one of the main resources of the company (Teece *et al.*, 1997; Husted and Allen, 2000; Hillman and Keim, 2001; Petrick and Quinn, 2001). With the above the following proposition is deduced:

Proposition 2: *Corporate social responsibility, when it involves employees in the company could have a positive influence on investor confidence.*

6.2 CSR and corporate reputation

The corporate reputation represents a set of perceptions that the stakeholders have about the behavior of the company. In particular, of the four cases discussed above (BCP, Interbank, BBVA and Scotiabank) it is deduced that the banking companies have sought to strengthen its "name"; that is to say, a continuous strengthening of its reputation. For this purpose, they have implemented plans of CSR oriented not only to the community but also to customers, investors, suppliers, etc. This effort has been reflected in some local contests on CSR, for example BCP won the award for "Social

Responsibility and Sustainable Development" in 2007 organized by Peru 2021. It is worth mentioning that this award is a recognition to good business practices that are aimed at seven key stakeholder groups: shareholders, partners, customers, suppliers, community, government and civil society, and environment. A recognition will be made to those programs of social responsibility of companies transversely working with two or more stakeholders (multistakeholder).

Likewise, this recognition, is an initiative of Peru 2021 - non-profit civil association led by entrepreneurs, whose mission is to get the company to acts as an agent of change for the country's development, incorporating CSR as a strategic tool management- which takes place ten years ago, since 2003. In the edition of 2012, Interbank was the bank that received this recognition through its program "All Terrain". From the above it is shown that the key stakeholders are interested in knowing the *performance* of the company in the aspects of CSR and from this form perceptions about its business reputation.

Also, of the reviewed literature, following the approach of the instrumental theory of CSR as a means of improving marketing (Varadarajan and Menon, 1988; Smith & Higgins, 2000) it is deduced that the objective of implementing plans of CSR should be to strengthen the relationship between the consumer and the company, in such a manner as to strengthen the brand, i.e. to improve corporate reputation. This raises the following proposition:

Proposition 3 : *The corporate social responsibility could have a positive influence on the corporate reputation.*

In addition, to the four cases studied it is noted that the plans of CSR are oriented to different regions than to the capital of Peru (Lima). This is important because such regions are less favored in terms of economic dynamics in comparison with the capital. For example the program "All Terrain" implemented by Interbank has been designed to facilitate access to financial services to employees of the firms that operate in rural areas, agricultural and/or of difficult access. This initiative, as has been mentioned before, has been rewarded by Peru 2021. This type of geographic orientation of the CSR plans, on the part of the companies, could be because they wish to strengthen their reputation throughout the country.

In this particular context, the defenders of the relational school of corporate reputation (Hatch and Schultz, 2001; Davies and Chun, 2002; Chun and Davies, 2006) argue that in the construction of the corporate reputation various *stakeholders participate*, and those that are geographically more further away from the company or who receive "less benefits" of business projects, could build a negative perception of the company affecting their reputation. From the above the following proposition arises.

Proposition 4: *Corporate social responsibility oriented towards rural areas outside the capital could have positive influence on corporate reputation.*

On the other hand, is appreciated that among the main actions of CSR those that stand out are oriented to improve educational quality. An example of this is the program of BBVA: "Reading is to be ahead". This program has enabled a significant number of teachers and students, in eight regions of the country, to increase the rate of reading and improve levels of understanding. Another effort similar to this is the program "The Teacher who Leaves a Mark". This program, implemented by Interbank, is a contest that recognizes the contribution of teachers in improving the quality of education, which began in 2007 and has the support of the Ministry of Education.

These efforts reflect the importance that companies give to education within their plans of CSR. This responds to the fact that these companies expect that the target population, which is benefited by these programs, build positive perceptions about the image of the company and thus strengthen its reputation over time.

This is in line with the political theories of the social contract (Donaldson, 1982; Donaldson and Dunfee, 1994, 1999), who suggest that the company could understand CSR as an integral social contract, in which it is committed to providing priority to structural issues of society such as education. In this regard, many companies are gearing their plans of CSR to the educational sector, which according to Dhir and Vinen (2005) could influence positively on the reputation of the company. From the above the following proposition arises.

Proposition 5: *Corporate social responsibility oriented to strengthen the educational quality could have a positive influence on corporate reputation.*

6.3 Corporate Reputation and investor confidence

Of the analyzed cases it is noted that the CSR programs are oriented to two large groups: education and financial inclusion. Both aspects respond to needs consensus by all *stakeholders* related to banking firms. In this regard, guiding efforts to increase the quality of education and integrate more Peruvians to the financial system would result in a favorable perception of the community and investors on the company's shares.

In this regard, the corporate reputation is strengthened and hence the confidence of investors outside the bank would increase. This is in line with the school of the evaluative CR (Williamson, 1985; Barney, 1991; Grant, 1995; Deephouse, 2000; most frequently used *et al.*, 2001; Bromley, 2002; Williamson, 2002; Eberl and Schwaiger, 2005) who argues that corporate reputation could reduce

transaction costs and attract better competitors and investors and improve your confidence . This raises the following proposition:

Proposition 6: *The corporate reputation could have a positive influence on investor confidence*

Also, due to the fact that in the last few years the environmental aspect has been strengthened in the social consciousness by means of differentiation channels of communication, companies have oriented greater efforts to be classified as "environmentally responsible" companies. This can also be seen in companies in the Peruvian banking sector, which have introduced plans of environmental responsibility within CSR. An example of this is the program "EcoBusiness School" created by IPES (Institute for the Promotion of the Social Economy), but financed by Scotiabank. It should be emphasized that "EcoBusiness School" is a program of environmental education and entrepreneurship, which is aimed at young school children aged between 14 and 16 years old.

The contribution of Scotiabank has allowed, on one hand to increase to one hundred the number of participating educational institutions, and on the other hand, train one hundred teachers in the areas of Science, Technology and Environment and Education for Work and to 461 students in business plans, budgets and team work.

These effort implemented by companies could respond to two factors: the first is that currently every company considered socially responsible must include a plan for environmental improvement; the second is that these plans (environmental) could contribute to strengthen the reputation of the company because it improves not only the perceptions of the stakeholders associated with the community but also those considered as investors, shareholders and stakeholders outside the company (local, regional and national governance).

The aforementioned matter has been partially approached by some authors within the scope of the developing school of CR, Deephouse (2000) y Kotha et al. (2001), who argue that the corporate reputation could improve investor confidence by means of a risk reduction not only financial and operational but also environmental. This raises the following proposition:

Proposition 7: *Corporate reputation could have a positive influence on investor confidence when the company demonstrates that environmental care is part of its strategic plan.*

CONCLUSIONS, LIMITATIONS AND FUTURE AGENDA

This research aims to study the relationship between CSR, corporate reputation and the confidence of the investor in the Peruvian banking sector. For this the literature has been reviewed, from which the research model is deduced. This model suggests that the corporate social responsibility could have

positive effects on the company's reputation (Newgren *et al.*, 1985; Bromiley and MacRus, 1989; Brown and Perry, 1994; Klassen and McLaughlin, 1996; Graves and Waddock, 1997; Wright & Ferris, 1997; Moore, 2001; Hill *et. al.* ,2003), that the corporate reputation could influence the confidence of investors (Orlitzky *et al.*, 2003; Margolis *et al.*, 2007; Wood , 2010), and that the latter could be influenced by the CSR (Klassen and McLaughlin , 1996; Graves and Waddock, 1997; Knox and Maklan, 2004).

In Peru, the corporate social responsibility has been usually within the scope of the productive sector; which means, it has been related to companies extracting raw materials such as the mining and fishing industries. The development of the CSR has been improving as time passed, and companies have been including strategic plans that seek the development of all the *stakeholders* involved with the operation of the company. In this line, the Peruvian financial sector since the beginning of 2000 has begun to include within its strategic plan different plans of CSR. Such is the case that, in recent years different banking companies have strengthened these plans because the result of the first actions have been positive.

Between the main results it can be mentioned that the Peruvian banking companies have improved their reputation because of its social responsibility. This reputation improvement has been correlated to a strengthening of the company value, in such a way that the net economical benefit that CSR represents has surpassed the execution costs of such plans. Also, the analysis of each of the cases, within the scope of the plans of CSR, seven propositions are deduced, classified in three relations (CSR and investor confidence , CSR and corporate reputation, and corporate reputation and confidence of the investor), which will seek to prove its veracity or falsification in future research with larger samples.

The main limitation of this research lies in the weakness of the method; that is to say, it does not seek to test hypotheses but only describe each case and suggest possible relations (hypothesis). Also, the lack of generalization from the analyzed data represents another limitation . However, it remains as future agenda to contrast propositions (hypothesis) proposed in this research. With regard to the latter (contrast of the propositions), it is anticipated that in future research surveys are used, which would be within the scope of different gerenciales lines of the four selected banks. In addition, these surveys should consider the direct different stakeholders with whom the company maintains a certain relationship not only in the capital, but also in the rural areas throughout the country.

In addition, this reserach could establish a model for relations between CSR and CR, in order that it can be applied in other countries and in other economic sectors such as mining or other sectors that consider important the CR and the stakeholder impact.

Another source of information to compare the propositions is MERCO (Business Monitor of Corporate Reputation), a company that has a set of information on corporate reputation in Peru. Previously, the database that has this company could serve to assess whether the CSR plans implemented by the banking companies have had an effect on the financial performance of the company.

ABSTRACT

There are no doubts nowadays that the amount of government spending may affect economic growth significantly. Economic theory distinguishes between different categories of spending, showing their different effects on growth. For sustainable long-term economic growth only certain types of expenditures are suitable. In this paper, we show that traditional classification of spending on so called productive and unproductive part is not accurate. Using the data for EU countries in the period 1995-2012, we show that only expenditure on collective services (e.g. defence, economic affairs, housing and community amenities and including all of expenditure on R&D) promotes sustainable long-term economic growth, while expenditure on individual services (e.g. health, education and social security without their part on R&D) has negative impact on growth.

Keywords: *Government Expenditure, Collective Services, Individual Services, European Union, Economic Growth.*

INTRODUCTION

Nowadays, fiscal policy and its impact on economic growth is a frequently discussed topic. It is a natural development, because at the time of economic, financial or debt crises, economists are looking for answers to questions about how to appropriately promote sustainable economic growth. For more about economic, financial or debt crises from several interesting points of view, see e.g. Funta (2011); Kačaljak (2011); Aiginger, Horvath and Mahringer (2012); Ziyadin (2012); Caba (2013); Olteanu (2013) or Šišková (2013). Economists analyze either the influence of different types of taxes, or the influence of different types of government expenditure on economic growth, but the aggregate influence of all the fiscal variables on growth is studied above all. However, in the analyses, in accordance with contemporary literature, direct and indirect taxes are usually distinguished, as well as productive and unproductive government expenditures, because to achieve sustainable long-term growth, it is not

possible to change the amount of the expenditure to infinity - the only way is to change their structure. The explanation of the categorization of taxes is that direct taxes have higher distortionary effects on the economy and thus harm economic growth more. In the case of government expenditures, there is an assumption that productive government expenditures are investment expenditures that support economic growth, while unproductive, consumption expenditures do not. However, the conclusions of empirical studies are contradictory. It has been neither significantly confirmed what the effects of separate types of taxes are, nor what the effects of particular types of expenditures are.

While the issues of the influence of taxes on growth were examined in several recent papers (Kotlán and Machová, 2012a, 2013; Machová and Kotlán, 2013a) and are not of interest in this paper, the effects of government expenditures seems a rather unexplored area. Starting from economic theory, there are also doubts about the accuracy of the classification of expenditure into productive and unproductive parts, or rather about the accuracy of the assignment of specific types of expenditures to productive or unproductive parts. There appears to be a question as to whether another classification would be better, with respect to the analysis of government expenditures effects on growth. One possibility is to study the separate effects of expenditures on individual, and on collective services including expenditures on R&D.

Thus the aim of this paper is to investigate the effects of government expenditures on economic growth in European Union countries, using their standard breakdown into productive and unproductive parts, along with alternative categorization. Empirical analysis is performed for a panel of 28 European Union countries in the period 1995-2012.

MODEL OF GROWTH: THEORETICAL AND EMPIRICAL FOUNDATION

Current growth theory is based on the model of Solow (1956) and its extension towards the endogenization of technological progress (Lucas, 1988; Romer, 1986). In the original Solow model, fiscal policy could not influence economic growth in a steady-state, i.e. the growth of developed economies. But later work, e.g. Barro and Sala-i-Martin (2004), shows that fiscal policy may affect particular growth variables (physical and human capital accumulation above all), and thus also the growth. According to Barro (1990) or Rebelo (1991), the growth rate of an economy (γ) in a steady state is equal to the growth rate of physical capital (k), human capital (h), and the growth rate of consumption (c) of households, and depends on intertemporal elasticity of substitution in consumption ($1/\theta$) adjusted to time preference rate (ρ), and net marginal rate of return on capital (both human and physical):

$$\gamma = \frac{\dot{k}}{k} = \frac{\dot{h}}{h} = \frac{\dot{c}}{c} = \frac{1}{\theta} (r - \rho). \quad (1)$$

In the basic model (1), taxes may affect the growth rate through their effect on the net marginal rate of return on capital. The channels are described in Mendoza, Milesi-Ferreti and Asea (1997), or Denaux (2007) in detail.

According to Barro (1990), government expenditures may be considered an input to private production in the event that they are of investment character (expenditures on infrastructure above all). In that case, government expenditures have a positive effect on economic growth, as they raise the net marginal rate of return on capital. Many empirical studies have been based on Barro's assumption, and this type of government expenditures has become labelled productive (see e.g. Kneller, Bleaney and Gemmell, 1999; Gemmell, Kneller and Sanz, 2011; Denaux, 2007). However, the studies differ in what type of real government expenditures they include into the productive part.

For simplicity, Barro (1990) assumes the broad concept of capital that includes both physical and human capital (consistently with Rebelo (1991) and his AK model). With constant returns to scale, the production (Y) function thus shall be as follows:

$$Y = AK \left(\frac{G}{K} \right)^\alpha = K \phi \left(\frac{G}{K} \right), \quad (2)$$

where A is the technology level, K is capital, G is productive government expenditure, α is technological coefficient, and ϕ expresses a positive decreasing marginal product (i.e. $\phi' > 0$ and $\phi'' < 0$). For the purposes of expressing the relationship between government expenditure and economic growth, it is possible to assume the existence of a flat tax rate on income τ , which is used to fund government expenditure: $G = \tau Y = \tau K \phi(G/K)$, in the case of a balanced budget. For simplicity, different rates for different types of taxes are not considered. The influence of different types of taxes is taken into account e.g. in Kotlán and Machová (2013). They show the channels through which the taxes affect the growth variables. They also point out that some economic and legal aspects of labor markets must be considered in the analyses. For these aspects, see e.g. Horvath (2012); Simonovits (2012, 2013); Schováňková (2013); Birčiaková, Stávková and Antošová (2013) or Nagy and Való (2013).

The net marginal return on capital is then equal to:

$$r = (1 - \tau) \phi \left(\frac{G}{K} \right) \left(1 - \phi' \frac{G}{Y} \right) = (1 - \tau) \phi \left(\frac{G}{K} \right) (1 - \eta), \quad (3)$$

where η is the sensitivity of Y to changes in G for a given K , and the growth rate of an economy is modified from the equation (1) to:

$$\gamma = \frac{1}{\theta} \left[(1 - \tau) \phi \left(\frac{G}{K} \right) (1 - \eta) - \rho \right]. \quad (4)$$

As already stated, the growth rate of the economy is thus positively affected by productive government expenditure, but the sensitivity of production to changes in government expenditure has, on the other hand, a negative influence on growth.

The most important study by Kneller, Bleaney and Gemmell (1999) uses the standard Classification of the Functions of Government (COFOG), but distinguishes only between a group of productive expenditures (including general public services, defense, educational, health, housing, and transport and communication expenditures), and a group of unproductive expenditures (including social security and welfare expenditures, expenditures on recreation, and on economic services). The authors show that the group of productive expenditures really positively affect growth, while unproductive ones do not.

Among similar studies, Denaux (2007) must also be mentioned. He uses the breakdown of expenditures on government expenditures to physical capital accumulation (approximated by stock of roads per cap.), and expenditures to human capital accumulation (approximated by government spending on schooling). He finds no significant effect of spending on physical capital, but he confirms the positive effect of spending on human capital, i.e. on higher education on economic growth.

However, as already stated within the introduction, the results of empirical analyses are not consistent, especially when a more detailed level of classification of expenditures is used. For example, Drobiszová and Machová (2015) also use the COFOG, but they include all the main types of expenditures into their analysis. They show that only spending on defense, education, health, and general public services have a positive effect on economic growth. Unlike the abovementioned studies, the positive effects of expenditures on infrastructure were not confirmed.

Recent experience from OECD countries shows that public wages, interest payments, subsidies and government consumption are less growth enhancing, while spending on education and health boosts growth (Afonso and Jalles, 2014). It is also interesting to realize the consequences of the fact that Bhattacharya and Mukherjee (2013) confirm that households in the OECD move from non-Ricardian to Ricardian behaviour as government debt reaches high levels and as uncertainty about future taxes increases.

At first glance it may seem that expenditures on, e.g. education and health, i.e. human capital, are provably supporting economic growth, while the effects of expenditures on, e.g. infrastructure are questionable. But it is very important to realize that, according to the methodology of COFOG 98, all of the main categories of government expenditures also include corresponding expenditures on R&D. This may significantly distort the analyses.

One of the ways to avoid this problem is to distinguish between expenditures on collective services, and individual services, which should be closer to Barro's approach above, assuming that expenditures on collective services have positive effects on growth, while expenditures on individual services do not. The classification and further explanation are described in following part.

EMPIRICAL ANALYSIS: METHODOLOGY, DATA AND RESULTS

According to the OECD and Eurostat (2012), individual services are the services that general government provides to specific identifiable households. That is, services such as health and education, which are consumed by households individually. Collective services are those that the general government provides simultaneously to all members of the community. That is, services such as defense and public order and safety, which are consumed by households collectively. Because they are considered as part of gross fixed capital formation (according to the SNA 2008, and ESA 2010), the R&D for individual services are also included, which is the most important point of the classification. Collective services also include the overall policy-making, planning, regulatory, budgetary, coordinating and monitoring responsibilities of ministries overseeing individual services. These activities, unlike the services to which they relate, cannot be identified with specific individual households and are considered to benefit households collectively.

Based on the COFOG 98, individual services include expenditures on:

- Health (category 7), Recreation, culture and religion (8), Education (9), Social protection (10),

except for categories including R&D (7.5, 8.4, 8.5, 9.7, 10.8), and n.e.c. categories (7.6, 8.6, 9.8, 10.9).

The excepted categories as well as categories:

- General public services (1), Defense (2), Public order and safety (3), Economic affairs (4), Environment protection (5), Housing and community amenities (6),

make up the group of collective services. The extend of all the expenditure types is involved by national and international laws. However, in the case of environmental protection, the impact of laws is very strong (for more on the legal aspects, see e.g. Černič, 2012; Bogataj, 2012; Škrk, 2012; or Gaberšček, 2012).

From a methodological point of view, the analysis was based on a dynamic panel model which used data for 28 European Union countries in the period 1995-2012. Real gross domestic product per capita in PPP (Y) was dependent variable. Independent variables included control growth variables, i.e. gross fixed capital formation as a percentage of GDP (K), and human capital expressed as share of tertiary education to the labour force in the 15 to 64 years (L).

The second group of independent variables was formed by fiscal variables. The model included both the revenue and expenditure side of the budget; fiscal balance was omitted to avoid perfect collinearity of the variables. Regression coefficients of the fiscal variables may thus be interpreted as a change of the output in the case that the corresponding variable as well as the fiscal balance in opposite direction is changed by unit, *ceteris paribus*. Fiscal variables included taxes expressed as corresponding tax quota, i.e. tax revenue-to-GDP (alternative indices could be also used, e.g. the World Tax Index, see Kotlán and Machová, 2012b; Machová and Kotlán, 2013b), and finally government expenditures. At first, productive and unproductive expenditure in accordance with Kneller, Bleaney and Gemmell (1999) were included, and secondly expenditures on individual services and collective services, all of them expressed as a percentage of GDP. The data was gained from Eurostat and the World Bank.

As the estimation technique, a generalized method of moments (GMM) was used, which included the method of instrumental variables. This method uses the Arellano-Bond estimator (Arellano, Bond, 1991), and the transformation method of first difference of each variable in the regression, which prevents potential problems with the stacionarity of the time series. Using a robust estimator in calculating the covariance matrices (White Period method) ensured that the estimation results of standard deviations of parameters and hypothesis tests were correct with regard to a possible occurrence of autocorrelation and heteroscedasticity. This estimation type ensures that the appropriate transformation process and using appropriate instruments eliminates the risk of endogeneity of the lagged values of the dependent variable and the independent variables with a random component. In the analyses below, the lagged values of the dependent variable were used as the instruments, starting

from a lag of two. A Sargan test (see the J-statistics in the tables below) confirmed the validity of the instruments in both estimated models. For better interpretation of the regression coefficients, all the variables were used in logarithmic form.

Table (1) shows the results of the estimation of the model including productive and unproductive government spending according to Kneller, Bleaney and Gemmell (1999). Table (2) shows the results from the model where government expenditures were divided on expenditures on collective services, and on individual services.

Dependent variable	log(GDP per capita)		
Instrument rank	28		
J-statistic	23.587		
Variable	Coefficient	Std. Error	t-Statistic
log(GDP per capita (-1))	0.735	0.022	34.042***
log(Capital accumulation)	0.126	0.025	4.899***
log(Human capital)	0.163	0.011	15.050***
log(Tax revenue)	-0.158	0.022	-7.280***
log(Productive expenditure)	0.026	0.027	0.975
log(Unproductive expenditure)	-0.246	0.022	-11.373***

*Notes: t-statistics are adjusted for heteroskedasticity and autocorrelation; standard deviations are calculated using robust estimates; *, **, *** indicate significance levels of 10 %, 5 %, and 1 %, respectively.*

Source: own calculations

Table 4. *Effects of productive and unproductive expenditures on growth in the period 1995-2012*

In both models, a statistically significant positive effect of control growth variables was confirmed, with human capital having a quantitatively stronger impact on long-run growth, which corresponds to economic theory for developed countries. Also, in both models, a statistically significant negative effect of taxes was confirmed. The issues of the influence of taxes on growth are not of interest in this paper therefore taxes are approximated as a total tax revenue in the model. For more detail about impact of particular types of taxes on economic growth see, e.g. Kotlán and Machová (2012a, 2013), or Machová and Kotlán (2013a).

With regard to the aim of the paper, the results concerning government expenditures are, nevertheless, the most important. Table (1) shows, that the influence of unproductive expenditures, classified according to Kneller, Bleaney and Gemmell (1999), on economic growth is negative, but in case of productive expenditures impact on economic growth are not significant.

Dependent variable	log(GDP per capita)		
Instrument rank	28		
J-statistic	23.287		
Variable	Coefficient	Std. Error	t-Statistic
log(GDP per capita (-1))	0.746	0.018	42.590***
log(Capital accumulation)	0.127	0.014	9.659***
log(Human capital)	0.170	0.010	16.186***
log(Tax revenue)	-0.230	0.009	-26.502***
log(Collective services)	0.022	0.008	2.843***
log(Individual services)	-0.310	0.012	-26.273***

*Notes: t-statistics are adjusted for heteroskedasticity and autocorrelation; standard deviations are calculated using robust estimates; *, **, *** indicate significance levels of 10 %, 5 %, and 1 %, respectively.*

Source: own calculations

Table 5. *Effects of expenditures on collective and individual services on growth in the period 1995-2012*

On the other hand, if the expenditures are examined in categorization on expenditures on collective and individual services (table 2), it is shown that the impact of expenditures on collective services is significant and positive, while the effect of expenditures on individual services on growth is negative and quantitatively is higher than the effect of unproductive expenditures.

CONCLUSION

The topic of fiscal policy and its impact on economic growth is very current, especially with regard to research questions that have arisen with the recent economic, financial and debt crises. Fiscal consolidation is inevitable in many countries, and their fiscal authorities are forced to make budget cuts, which is in direct conflict with the standard Keynesian approach. Furthermore, many empirical papers have confirmed the negative effects of most types of taxes on economic growth. Improving fiscal balance by raising taxes could thus be counterproductive. On the other hand, there also exist theoretical as well as empirical studies showing that certain types of government expenditures may have significant positive effects on economic growth. Restructuring the expenditures side of a budget could thus improve the performance of the economy without any negative effects on fiscal balance. This implies that not only by changing the amount of government spending in the economy, but solely by changing their structure may promote sustainable economic growth.

Most of the previous studies distinguish between the effect of so-called productive and unproductive government spending. However, unproductive expenditures also include expenditures on R&D in those studies, as well as expenditures on education and health which are of an individual character. These methodological discrepancies may be easily avoided using a classification distinguishing

between expenditures on collective services, and expenditures on individual services, which is also in accordance with new national accounting methodology SNA 2008 and ESA 2010.

This approach was also used in this paper, where a dynamic panel model for 28 European Union countries in the period 1995-2012 was estimated, using a GMM and instrumental variables method. Two models were estimated – the first included government expenditures classified as productive and unproductive in accordance with the literature, while the second included expenditures on collective, and on individual services. In the first model, unproductive government expenditures have a negative effect on growth, but in the case of productive expenditure the effects are not significant. It only supports the inconsistency of the results in the case of the breakdown of expenditures on productive and unproductive. On the other hand, in the second model, it is shown that, in accordance with the assumptions, expenditures on collective services, including all the expenditures on R&D, positively affect long-run economic growth, while the expenditures on individual services, including individual expenditures on education and health, affect growth negatively.

The results support the idea that the conclusions of previous studies on this topic may be strongly distorted by the inappropriate classification of expenditures, typically in the case of expenditures on education and health. These are usually considered productive, but if their part of R&D expenditures is detached, their effect on growth is not clear in fact.

SEA AND SEE PIRACY

Maniatis, Antonios

Captains School of the Merchant Navy Academy of Aspropyrgos, Greece

ABSTRACT

Maritime law is intrinsically connected with the fundamental principle of freedom, particularly on the high seas. Piracy is a non-political economic crime committed by private individuals against ships or planes, and the relevant air space. However, the term "piracy" is informally used for copyright crimes and has recently been connected even with campaigns against cigarette smuggling. This paper aims at analysing the real nature of piracy both in its literal meaning, at the sea, as well as in its metaphorical one, in copyright terms, particularly on the Internet.

Keywords: Antipiracy, Cigarette Smuggling, Cultural Sponsorship, Copyright, Maritime Law, Nautical Law, (Air / Maritime / Intellectual Property works) Piracy, "Piratage"

INTRODUCTION: NOTION OF MARITIME LAW

Maritime Law is the legislative branch having to do with navigation and shipping. It is divided into Nautical Law, which has a general content, and Shipping Law. Nautical Law has to do with Public Law, regulating the role of the state against shipping factors and navigation, such as the Shipping and Aegean Ministry in Greece, the coastguard etc., and with Private Law (Commercial Law and Labor Law).

Shipping Law is a branch of Commercial Law, including various forms of contracts focusing on the economic exploitation of ships, particularly the charter agreement for the transport of passengers and mainly of cargos and the maritime insurance contracts.

It would be interesting to focus on the phenomenon of maritime piracy, which is regulated by Nautical Law. More concretely, this paper aims to analyze the question whether there is a piracy law, let alone with repercussions on copyright law.

AN INTRODUCTION TO PIRACY LAW

The international public law has piracy as its most typical and diachronic crime, as far as this economic and non-political crime is committed by private individuals (not by states) outside territorial waters of any sovereign state (Chapleau and Pancraccio, 2014). Piracy may be committed in territorial waters; in this case it is not a crime of international law.

However, the most usual version has to do with non-national spaces. Even in this case, suspected pirates should be judged by a national jurisdiction (Scharf, 2015). The United Nations Convention on the Law of the Sea (UNCLOS), of 1982, declares the Freedom of the high seas in article 87. The high seas are open to all states, whether coastal or land-locked. Freedom of the high seas is exercised under the conditions laid down by this Convention and by other rules of international law. It comprises *inter alia* freedom of navigation, overflight, to lay submarine cables and pipelines, to construct artificial islands and other installations permitted under international law, of fishing and of scientific research.

Article 101 cites: *“Piracy consists of any of the following acts:*

(a) any illegal acts of violence or detention, or any act of depredation, committed for private ends by the crew or the passengers of a private ship or a private aircraft, and directed:

(i) on the high seas, against another ship or aircraft, or against persons or property on board such ship or aircraft;

(ii) against a ship, aircraft, persons or property in a place outside the jurisdiction of any State;

(b) any act of voluntary participation in the operation of a ship or of an aircraft with knowledge of facts making it a pirate ship or aircraft;

(c) any act of inciting or of intentionally facilitating an act described in subparagraph (a) or (b)”.

The Convention previews no criminal law sanctions but it implicates the obligation of states to collaborate against this kind of criminality. More concretely, article 100 cites that all states shall cooperate to the fullest possible extent in the repression of piracy on the high seas or in any other

place outside the jurisdiction of any State. Piracy is considered as a 'crime against humanity', transgressing the diachronic legal principle of freedom, particularly of navigation.

Pirates are private individuals that attack mainly ships (or planes), to get economic benefits.

CASE STUDY: SOMALI PIRACY OFF THE COAST OF EAST AFRICA

Piracy in Somalia has been a threat to shipping, since the second phase of the civil war, in the early 21st century. The continuous attacks by pirates in the Gulf of Aden have attracted the immense interest of the international community for Somalia. In 2009, the Forbes Magazine named the East African country the „World's Most Dangerous Country" (Osei-Tutu, 2011). Piracy originated after state collapse in 1991, as foreign trawlers began illegally overfishing Somali waters and local fishermen were organized to protect their livelihood (Singh and Singh Bedi, 2012). Since 2005, many international organizations have expressed concern over the rise in acts of piracy. Piracy impeded the delivery of shipments and increased shipping expenses. As a result, insurance companies significantly increased their profits relevant to the pirate attacks risks.

Figure 1: Somali pirates logo

For instance, the release by pirates of the ship "Asphalt Venture" in April 2011 took an unexpected turn that was estimated to change forever negotiation practices with pirates (Zachariadis, 2011). The agreed ransom was paid in full but not all the crew-hostages were released. Several crew members were retained by the pirates who, for the first time, did not keep their word. Seven crew members from this vessel, held four years in Somalia, were released and were safe in Kenya, according to the Maritime Piracy Humanitarian Response Programme, in October 2014.

The wider region of Somalia remains the main region of piracy attacks, worldwide, in spite of the fact that from 2013 and on there has been an important decline in such events. IMB says that the single

biggest reason for the drop in worldwide piracy is the decrease in Somali piracy off the coast of East Africa. Somali pirates have been deterred by a combination of factors, including the key role of international navies, the hardening of vessels, the use of private armed security teams, and the stabilizing influence of Somalia's central government. (Anonymous I, 2014) However, it remains the case that the pirates are active and retain the capacity to attack far into the Indian Ocean. ICS emphasizes that it is premature to conclude that the crisis is over, with seafarers still held hostage in Somalia, some of whom have now been in captivity for three years. (Anonymous II, 2014)

ANTIPIRACY MEASURES

The need for protection of shipping against piracy has led to two developments of major importance, from 2008 and on.

First of all, European Union has created the first military navy fleet in its history, to cope with piracy in the wider region of Somalia. This operation, called "ATALANTA", is a European example of syncretism, having a very important impact, particularly in terms of prevention. Another similar operation, the NATO force "Ocean Shield", collaborates with this fleet.

The second measure, adopted in various national legal orders, was about the institutionalization of protection offered by private professional guards, being onboard only when ships pass through the zones of high danger for piracy attacks, like Somalia, Nigeria etc. This international trend of traditional nautical countries is exemplified by specialized law 4058/2012 "Delivery of services by unarmed or armed guards to merchant ships and other dispositions", in the Greek legal order. One of the first cases of application of this measure was the protection of the oil product tanker, "Great Lady", registered in Greece, in August 2012. Somali pirates attempted to rob the ship, which was protected by four unarmed professional guards being in cooperation with the crew. They could not reach the ship surface because their ladders were proved to be too short to make landing.

French Republic was reluctant to modernize its maritime law by adopting the measure of private guards onboard, as this state was inspired by "doctrine Colbert". This doctrine has to do with the traditional culture of state interventionism for the protection of merchant navy, introduced by the Marine Minister Baptiste Colbert in eighteenth century. Antipiracy policy was considered as a case of "royal power" (Beurier, 2014). However, in 2014 the French state institutionalized anti-piracy protection by private guards for mercantile navy, registered in France. French law is rather

conservative as it previews that the guards onboard should not be less than three. In a parallel way, France still makes use of its own Military Navy, more precisely of the so-called “embarked teams of protection”. Before this liberalization of the legal status, it had conducted various operations against current piracy, on its own.

SEA CONTESTATION MOVEMENTS BAPTIZED PIRATE

In the sixteenth century to the eighteenth one, namely in the period of growth of the phenomenon of piracy in the Mediterranean, a lot of people, many sailors being among them, became pirates because of sociopolitical conditions. European kingdoms exerted an authoritarian power and social inequalities became acute. Catholic Church banned almost any new idea and act aiming at the development of society or the change in religious beliefs. The structure and the administration of the society of the pirate ship were thoroughly different from the ones of a merchant vessel or a warship. Decisions resulted from voting whilst the captain did not benefit from a regime of privileges against crew. In cases the crew was dissatisfied with the skipper, he could lose his post through voting. Besides, all pirates had access to the booty, without discriminations. It is to point out that pirates acted and decided in terms of an informal democracy. So, it has been signalized that pirates have been the precursors of constitutional governance. They offered the first evidence that democracy is a very successful form of social organization (Karizoni et al., 2010).

From sixteenth century to nineteenth century, a particular rule was formed within international law. The rebels operating at sea were prosecuted for the crime of piracy. For instance, Irish people made nautical war in favor of the former King of England James II, who was the last Roman Catholic monarch to reign over England, Scotland and Ireland. Those maritime rebels were executed by being hung while the members of the Army, defeated in 1690, were treated as war captives. Comparable cases took place during the civil war in the USA, where tribunals considered attacks coming from vessels of the forces of the South as pirate ones. Piracy is very close to the phenomenon of privateers, authorized by the King of a state to attack foreign ships, particularly of merchant navy, in time of war. Through this practice, the military navy of the King could be devoted to attack the military fleet of the enemy state. Furthermore, privateers should share the booty with the state, in contrast with pirates that had no political mandate and no state to share the pirated goods with. The operations conducted by privateers were as a general rule abolished by the treaty of Paris, which terminated the war of Crimea, in 1856, in spite of the fact that the USA Constitution still previews this anachronistic mechanism.

SEE CONTESTATION MOVEMENTS BAPTIZED PIRATE

French language has an important particularity, as it is endowed with two forms to designate the same thing, in its both literal and metaphorical meanings, namely “piraterie” and “piratage”, respectively. The term “piraterie” is the general one, being in use with both meanings while the other term is used only for copyright cases, such as spectacles, Informatics programs etc. It is not useless to point out the roots of this metaphorical use of the term “pirate”. “Pirate” has been used in England, from the seventeenth century and on, namely before the Statute of Anne, to mention the guild of printers, (the Stationers’ Company), who did not pay respect for the privilege of the University (Macrez, 2014). This use was clearly of a metaphorical nature, against the literal meaning of maritime piracy (theft or robbery against ships at the sea).

The Statute of Anne, an act of the Parliament of Great Britain, was the first statute to provide for copyright regulated by the government and courts, rather than by private parties. Prior to this text, being in vigor from 10 April 1710 and on, and copying restrictions were authorized by the Licensing of the Press Act 1662. This regime was enforced by the Stationers’ Company, given the exclusive power to print as well as the responsibility to censor literary works. The censorship administered under the Licensing Act led to public protest. As the act had to be renewed at two-year intervals, authors and others sought to prevent its approval. In 1694, the Parliament did not renew the Licensing Act, ending the Stationers’ Company monopoly and press restrictions.

Nowadays, the principle of freedom of navigation on the high seas tends to be duplicated. Indeed, the freedom of “navigation” in the cyberspace is a strong political demand, being partly or indirectly institutionalized in legislative texts of international and national legal orders. In 1968 a movement began to make speech of the “death of the author”, against the originality of the creation of the individual authors, with the famous article of French expert Roland Barthes. On the basis of this doctrine, the idea itself of the creator is informally abolished (Spivey, 1996). Nowadays, the new technologies lead to serious contestation of the traditional copyright of the author, particularly for material available on the Internet (Grynbaum et al., 2014). However, jurisprudence is still not friendly to free use of legally protected audiovisual material. For instance, in the *A & M Records v. Napster* case, the tribunal judged in 2001: *"Napster users infringe at least two of the copyright holders' exclusive rights . . . Napster users who upload file names to the search index for others to copy violate plaintiffs' distribution rights. Napster users who download files containing copyrighted music violate plaintiffs'*

reproduction rights....[V]irtually all Napster users engage in the unauthorized downloading or uploading of copyrighted music. . ."

Figure 11: Logo of the online-music store Napster

TOBACCO PRODUCTS PIRACY AND ADVERTISEMENT BAPTIZED CULTURAL SPONSORSHIP

Another pirate sign has been recently invented as a discouraging logo, and it is the case of the tobacco products companies in Greece. It is to correlate this graphic warning with the fact that on European scale, among the provisions of the revised Tobacco Products EU Directive, three are claimed by the tobacco industry to be potential drivers of illicit cigarette trade: 1) graphic health warnings, 2) restrictions on packaging and 3) regulation of ingredients. Nevertheless, according to a European Parliament study, there is no indication that implementation of pictorial health warnings increases illicit cigarette trade. Studies revealed that the more aversive a warning, the more it is perceived as effective against smoking. (Volchan, E., Isabel A.; Tavares, G.; Nascimento, B., Oliveira, J., Gleiser, S., Szklo, A.; Perez, C., Cavalcante, T., Pereira, M., Oliveira, L., 2013).

More than 60 countries now require pictorial health warnings on cigarette packs, and there is no research evidence of increased levels of illicit cigarette trade due to these new regulations. In the UK, after implementation of pictorial health warnings in 2008, the illicit cigarette share of the cigarette market dropped from 12% in 2008/2009 to 9% in 2012/2013, according to estimates by HM Revenue & Customs. This drop in illicit cigarette trade levels occurred with the UK having one of the highest

tobacco taxes in Europe. Similarly, a recent survey of 1,024 smokers in Belgium revealed no significant purchases of cheap cigarettes from friends and street vendors (illicit cigarettes) after the country's implementation of graphic health warnings in 2007 (European Parliament, 2014).

Figure 3:

Discouraging logo and picture on tobacco products

It is to point out that indirect taxes, traditionally imposed on legal cigarette commerce, raise often severe criticism. In other words, states may gain incomes from this technique of taxation but this funding is however unfair in socioeconomic terms. Unfair taxes create contestation, just as high prices of copyrighted audiovisual material.

Last but not least, cultural sponsorship in its current form appeared initially in 50's in the USA. Companies, mainly the big enterprises in the tobacco market, started to accomplish the mission of sponsors when they faced serious problems of media exclusion in the sector of advertisement, because of the introduction of the antismoking legislation. Due to this legal obstacle, they decided to enhance their image, *inter alia* by sponsoring the arts production. It is about a very interesting case of formal prohibition that led to a new form of deontology, the corporate responsibility. Of course, it was not merely a question of a best practice in terms of managerial deontology but mainly a suitable communication means to achieve commercial targets. So, cultural goods are in various aspects controlled by the tobacco industry, which baptizes and treats as pirates the smugglers contesting its own privilege, to cause cancer in counterbalance of its social corporate responsibility, whose emblematic form is cultural sponsorship.

CONCLUSION: VOICI LE TEMPS DES PIRATES

The combination of the aforementioned measures against maritime piracy, such as operation ATALANTA and protection by private guards onboard, has been conducive to success, at least against piracy in the wider region of Somalia. However, almost never pirates have been beaten at the sea in the entire history of mankind.

It has been proved that the state power has baptized various, dangerous for its own interests, contestation social movements as pirates so to marginalize them and to punish them hard, particularly in the UK. This is the case of factors of navigation, such as the rebels leading a maritime war, and the holders of the copyrighted pieces reproduction and promotion, like the printers.

However, history:

1. Teaches that all big Revolutions of mankind from the American Revolution and on, were driven by economic reasons, exemplified by the question of abolition of slavery being existent till the current era (Skinner, 2008). So, piracy in a wider sense (Napster case, cigarette smuggling etc.) has a socioeconomic legitimization in praxis.
2. Takes revenge, through the boomerang effect, exemplified by the case of the principle of freedom of navigation. The literal meaning of navigation was combined by the diachronic criminalization of maritime piracy, particularly on the high seas, while the metaphorical meaning (use of the Internet) contests the copyright version of piracy itself, at least on the Internet.

In this context, it is about time mankind created and elaborated a flexible branch of law, Piracy Law, on the basis of various anthropocentric and consumer - oriented principles, such as the liberty of expression, the liberty of press, the consumers fundamental rights etc. Piracy Law should regulate maritime piracy and hijacking as crimes but policy – makers should also take measures to eradicate the real reasons of this particular “blue collar” criminality. Furthermore, it should be enriched by a systematic opening to the field of copyright law, Internet law etc. In this framework, the notion of “piracy” should be revised, at least as long as pirates in non-juridical terms could be conceived as those that love and want to savor life, the amateurs of life.

Paraphrasing Arthur Rimbaud, being the main fan of revolution among the poets, at the emblematic end of its poem “Morning of Drunkenness”:

Voici le temps des Pirates.

A CARING INTERPRETATION OF NON-PROFIT AND THIRD SECTOR ORGANIZATIONS

Marcon, Giuseppe; Dorigo, Lorenzo

Department of Management, Ca' Foscari University of Venice, Italy

ABSTRACT

The paper aims to present care morality as a normative stakeholder approach for advancing meaningful conceptions and interpretations of the responsibility principle in non-profit and third sector organizations. The language and method of care, with their focus on both dialogue and the reciprocal strengthening of interpersonal relationships as a primary means of moral deliberation, prove to be sound and defensible for enhancing proper justifications of the moral legitimacy of stakeholder and 'organization-stakeholder' relationships in European third sector environments. A reasoned review of the main literature on caring offers new insights and suggestions to conceive of non-profit and third sector organizations as ideal 'architectures of care' that might simultaneously enhance the effectiveness and moral quality of public service provision in local communities.

Keywords: *care, ethics, non-profit organizations, third sector organizations, stakeholder involvement*

INTRODUCTION

The current turmoil facing Western European societies has relevant consequences for the sustainability of third sector economies. The steady shortages of public funds in a transnational context characterized by chronic budget constraints and structural crises of social-welfare systems, are forcing non-profit and third organizations to rethink their strategies and restructuring their service-delivery models in order to survive. This legitimacy crisis of third sector economies has also deep ethical roots and consequences that urge organizations and management scholars to call for a revival of the contribution of ethics and moral disciplines to the subject.

At first glance, such a revival would seem tautological, if not almost paradoxical, when specifically concerning non-profit and third sector organizations. Indeed, management scholars and practitioners often conceive of such organizations as ethically driven. This is to say that they are thought to share an intrinsic moral commitment to social responsibility, inherent both in their social purpose and in the co-operative nature of the relationships they establish with service users and community stakeholders.

However, there is a need to develop new approaches and methodologies that are able to disclose new ethical perspectives for reassessing or, in some cases, reshaping, concepts and interpretations of the proper ethical basis and morals underpinning their organizational principles of responsibility. In so doing, organization and management scholars still have a real chance to delve into ethical disciplines for the purpose of rediscovering ethical thought and moral philosophies. The path this paper suggests is consistent with helping non-profit actors and practitioners to clearly understand what it means to reason – and what really counts as reasoning – with real facts and decisions from a value-laden, moral viewpoint.

At its simplest, ethics is nothing more than a system of normative cores and moral principles that force us to account wisely for ourselves and our actions in order to offer good and defensible reasons for our decisions and to justify our own conduct. What counts as a ‘good reason’ (or bad reason) – whether a set of justifications to give decision-makers clear choices or a right (or wrong) justification to come to their own conclusions – is indifferently influenced on the basis of the normative approach we assume for determining or evaluating ethical behavior. Such relevant aspects here include the duty to comply with principles and rules, the role of one’s character and virtues embodied by one’s character, and the consequences derived from the outcome of an act or a decision itself. Ethical disciplines and moral philosophies, basically, serve as common theoretical grounds for identifying a range of substantial normative cores and value systems that enable us to put practical questions and events up for meaningful conversation and discussion. Highlighting an underlying moral stance may be of special interest for grounding and developing more suitable decision-making skills. This ability may help tackle the growing ambiguities and uncertainties that board advisors, staff, or volunteers currently face when dealing with dilemmas of responsibility and accountability deficits in modern non-profit and third sector environments.

This work aims to outline the salient contents and methodological traits of the normative theory of care, with a special concern on offering new insights and suggestions for reasoning on care morality in approaching managerial studies on non-profit and third sector organizations.

The paper is organized as follows. The next section proposes an alternative methodology to mainstream business thought for approaching ethics in organization and management research. This underlies an attempt to highlight the strict interdependence and blurring of boundaries that exist between the ethical sphere of knowledge and the understanding of facts and managerial decisions in organizations, which is a point of special importance when considering the moral relevance of ‘stakeholder-organization’ relationships in given, situated contexts, such as in non-profit and third sector markets. In the wake of this argument, in the second section, the theoretical fundamentals and methods of feminist ethics, and, especially, of the moral grounding of care, are presented. This is

directed at shedding light on care morality as a normative stakeholder approach for advancing meaningful concepts, sound descriptions, and coherent interpretations of the responsibility principle. The third section suggests a *caring* interpretation of non-profits and third sector organizations, based on four distinguishing attributes useful for setting the boundaries of care. This hopefully helps to conceive of these organizations as an ideal type of 'caring organizations' that are able to simultaneously enhance the effectiveness and the moral quality of public service provision in local communities.

PRELIMINARY CONCEPTS: THE 'INSEPARABILITY PRINCIPLE' AND THE ROLE OF 'VIRTUE ETHICS' IN STUDYING NON-PROFIT AND THIRD SECTOR ORGANIZATIONS

For outlining a new ethical thought for non-profit and third sector organizations, and in order to ensure that it might really fit for the purpose of properly affecting the moral debate on these organizations, a preliminary step needs to be taken, namely, to assume the 'inseparability principle' (Freeman et al., 2010) as an epistemological foundation of the ethics in modern organization and management sciences.

As simply put by this principle, ethics is seen as a body of knowledge that cannot be distinguished from knowledge of real facts and phenomena. This amounts to saying that, when a certain fact happens, or a certain decision is made, several ethical and moral consequences and evaluations related not only to our own interest, but also, at least, to the interests of one other part, inevitably arise and give birth to new knowledge about reality. Hence, facts, decisions and values are inseparable from their own implicit moral constructs. This deep intermingling of real facts and values holds implications that go beyond the common understanding of reality in the modern organization and management sciences. It allows real facts to be re-valued and reinterpreted by means of new moral concepts and ethical reasoning that are ultimately designed to make a more genuine moral sense of our own conduct, as well as others'. Actually, business facts and managerial decisions always have consequences, and the way these consequences are distributed among the individuals and group stakeholders necessarily involves ethical issues. Furthermore, reciprocally, one can hardly encounter moral judgements or ethical decisions that do not involve any type of business facts or consequences.

Such moral epistemology, however, stands in stark opposition to the usual role of ethics and the usual way of understanding the responsibility principle in modern organization and management sciences. In fact, in such contexts, analyses and conversations involving ethical reasoning and moral judgments are inherently antagonistic and fundamentally separate from theory building and the making of knowledge regarding facts and managerial decisions.

In this regard, literature on business ethics offers clear examples of the major strands of thinking based on such an epistemological dichotomy (Freeman et al., 2010). At first, as a disciplinary specialty, business ethics deals with the sophisticated analysis of practical and specialized problems on behalf of practitioners and managers, who often need consultancy and the right training to navigate ethical dilemmas in their own strategy-making in order to avoid destroying 'shareholder value'. Secondly, ethics is asked to serve as an extension of the law, a form of external constraint that reins in the excess of selfish actors. At the core of the issue, that is, there is no connection seen between ethics and self-interest. The role that ethics plays in the market, for instance, is essentially normative, as it helps to accomplish the 'invisible hand' by making sure that a firm's behavior does not become so driven by its own self-interest that entrepreneurs begin to run a business for the sole purpose of taking advantage of others – whether by fraud, lying or theft. In the same vein, ethics has to do with the moral foundations that underlie corporate social responsibility (CSR). In CSR rhetoric, ethics, as applied to business, serves primarily to balance the firm's self-interest by extending the enterprise's function to society as a whole. The firm is regarded as a voluntary contributor to society and is supposed to perform this role mainly by promoting inter-sector partnerships with charities, by adopting good citizenship practices, by enhancing the safety of employees or by assessing quality standards for consumers and clients. Though the CSR literature recognizes the existence of implicit moral obligations on the part of the firm, considering them basically as legal, economic and social by-products of society, it has thus far not offered any sound justifications or inspiring remarks regarding the fiduciary duties or moral obligations underpinning CSR. The supposed normative cores underlying the notion of CSR remain rather vague and mostly under-theorized. Despite repeated references to the universal values of justice and fairness, as well as the implementation of cooperative schemes of corporate citizenship (Wood and Logsdon, 2002; Palazzo and Scherer, 2006; Waddock, 2006), this largely undefined normative approach paves the way to the emergence of a dominant thinking on CSR that is broadly disconnected from ethical disciplines and moral philosophies.¹

Moving the focus of ethical thought from compliance with hard-and-fast rules and abstract codes of moral conduct to the (re)discovery of human virtues would help us to gain an idea of how human virtues are still deeply embedded in current non-profit and third sector environments. Dignity, care, mutual aid, sociality and solidarity (meaning a personal sense of interrelatedness and connection to others), for instance, are all humanist values deeply embedded in human beings, who share an inborn concern for something or someone beyond our own self-interests. Basically, these human virtues refer

¹ Indeed, it has to be noted that the CSR approach, along with the above-mentioned main strands of thought in business ethics, shares a common epistemology with philosophical objectivism, best epitomized by the 'ethics of justice' (Gilligan, 1982).

to a sort of morality that is intimately connected to the subjective and interpersonal aspects of the self in relationship with 'the other' in a given context. Embracing such a value system as a common ethical ground, therefore, would help to deepen our critical understanding of the nature of moral obligations, social norms and fiduciary duties, as well as the ways in which they affect an organization's responsibility. Ultimately, this ethical ground would also help to 'humanize' our common sense about the morally desirable nature of stakeholders' expectations and behaviors when studying non-profit and third sector organizations. In this sense, the core aspect of the notion of 'stakeholder', that is, the intrinsic moral commitment affecting the nature and functions of 'organization-stakeholder' relationships, lies at the very heart of the theoretical questions about the sources of moral legitimacy and the principle of organizational responsibility.

FEMINIST ETHICS AND MORAL GROUNDING OF CARE

Amongst the most relevant ethical theories investigated in the stakeholder literature,¹ 'feminist ethics' and, more specifically, the moral grounding of *care*, possess distinguishing virtues and attributes that deserve special attention when considering the sources of moral legitimacy influencing the responsibility of non-profit and third sector organizations.

Feminist thought has been developed over many decades as a critical analysis of and reaction to contemporary mainstream economics and social science. Feminist ontology of human beings is tied to their epistemology. It assumes that humans are essentially relational, not individualistic beings, and that this social nature cannot be separated from the self (England 1993, 2003; Nelson, 2003). Individuals know through their relationships, and these sources of knowledge also have moral worth, as they provide the basis to undertake open-ended responsibilities with regards to each other (Sevenhuijsen and Svab, 2003). For feminist scholars, the social construction of contemporary economics has to be questioned from the central standpoint of its relationship to gender. Gender relates to the ways in which society ascribes 'masculinity' or 'femininity' to people, activities and concepts (Ferber and Nelson, 1993, p. 1ff.). Economics mirrors the way people have come to think about economic life. In the social construction of modern economics, culturally 'masculine' conceptual associations are signalized, such as men and market behaviors, along with culturally 'masculine' features, such as autonomy, abstraction and logic. Quite opposite conceptual associations are labeled as 'feminine', such as women and family behavior, along with culturally 'feminine' attributes of connection, interdependence, concreteness and emotion. In other words, feminists have argued that

¹ A synopsis of the most relevant literature examining the moral foundations of thought on the stakeholder is offered by Phillips, Freeman and Wicks (2003).

masculinity entails separation from others, the creation of a strongly bounded sense of self, and a drive to establish agency, power relations and domination in order to ensure stability and predictability over others, whereas human emotions, care, enthusiasm and personal vulnerability are seen as impediments to action (Sevenhuijsen and Svab, 2003).

Feminist economics has extensively influenced stakeholder thought, notably beginning in the 1990s. In this process of transposition, some of the early and most prominent stakeholder scholars, including R. E. Freeman, have led, with the outcome defined in various ways, but always with labels suggesting far-reaching revisions, such as 'reinterpretation' (Wicks, Gilbert and Freeman, 1994), 'alternative approach' (Burton and Dunn, 1996b), 'hybrid approach' (Burton and Dunn, 1996a), or 'different perspective' (Burton and Dunn, 2005). Wicks, Gilbert and Freeman (1994, p. 475) start from the consideration that certain masculinist assumptions 'retained by stakeholder theory from the wider business literature' limit the usefulness of the theory, and that 'the resources of feminist thought provide a means of reinterpreting the stakeholder concept in a way that overcomes many of the existing limitations'. The intent is to suggest a different insight into 'the identity and meaning of the firm', that is, into the very core of stakeholder theory. This particularly results in a diverse image of firm-stakeholder relationships and of 'what it means for a firm to succeed', which reflects the very purpose of the firm. Indeed, some masculine metaphors are contrasted with feminist alternatives. The reasoning revolves around the following five major combinations, with the first metaphor reflecting the masculine view, while the second reflects the feminist view (Wicks, Gilbert and Freeman, 1994, p. 475):

- Corporations as autonomous entities, separate from their environment vs. corporations as webs of interpersonal relations between and among stakeholders as individuals;
- Corporations as entities aiming to enact and control their environment, seeking order and stability vs. corporations accepting change and uncertainty as enriching forces, and hence guided by the idea of 'thriving on chaos';
- Conflict and competition as a fundamental approach to managing firms vs. communication and collective action (or adversarial vs. cooperative approaches);
- Objective strategy formulation vs. strategy as a process of solidarity, drawing on people's capacity to challenge situations with empathy and communication;
- Power and authority structures as strict hierarchical constructions vs. decentralization and empowerment of people by promoting communication, involvement, trust and commitment.

On the whole, the general meaning of the proposed revisions adhering the feminist view reinterprets stakeholder management as aimed at creating value 'for an entire network of stakeholders by working to develop effective forms of cooperation, decentralizing power and authority, and building consensus among stakeholders through communication to generate strategic direction' (Wicks, Gilbert and Freeman, 1994, p. 493).

One of the most relevant strands of thought underlying the feminist philosophy is the 'ethics of care' (Gilligan, 1982; Noddings, 1984, 1999; Held, 2006). It is linked with considering relationships as an essential part of the firm, since 'a firm and its stakeholders are related to each other as part of their very existence' (Burton and Dunn, 1996b, p. 2). Transposed into stakeholder theory, this implies the adoption of a caring approach to stakeholders.

The caring approach to stakeholders has been mainly developed as scholars' response to their frustration with the direction stakeholder research has taken with its adoption of a contractual-based moral grounding and ethics of justice (Wicks, Gilbert and Freeman, 1994; Burton and Dunn, 1996a; Wicks, 1996; Burton and Dunn, 2005). Care scholars have implied that stakeholder theory is something different from a mere collection of generalized rules and universalizable principles; instead, it is a way of managing and practicing relationships that must be understood in depth and lived within particular contexts (Burton and Dunn, 2005). Wicks, Gilbert and Freeman (1994, p. 12) precisely state that 'the corporation is constituted by the network of relationships which it is involved in with employees, customers, suppliers, communities, businesses and other groups who interact with and give meaning and definition to the corporation'. In this sense, the ethics of care, like stakeholder theory, is built upon recognizing the interdependence between and among the individuals who form stakeholder groups. Stakeholder relationships are best investigated by focusing on interpersonal aspects of consensus building, communication, trust and cooperation, as it is likely that managers ought to respond to stakeholders mainly with understanding, concern and the desire to do something to help them (Burton and Dunn, 2005). The adoption of care, indeed, implies a substantial change in managerial attitudes toward firm's stakeholders that emphasizes 'the importance of human interaction and the ability to flourish in a network of relationships' (Wicks, Gilbert and Freeman, 1994, p. 494).

Moving onto a more specific, care-based line of ethical inquiry, the widely referenced first major work by Noddings on the 'ethics of care', *Caring* (1984), provides landmark insight into the 'feminine approach' to the ethics of care. According to Noddings (1984), care and the commitment to sustain it are seen as the universal heart of ethics. The author has proposed a well-known distinction between two defining concepts of care, concepts that have been progressively refined: *caring for* and *caring about* (Noddings, 1984). While *caring for* implies 'face-to-face encounters in which one person cares

directly for another', *caring about* is more general in character, since it may refer to 'strangers who have not addressed us directly, or those unknown others at a great distance' (Noddings, 1999, p. 36). '*Caring about*' may be the foundation of justice, while *caring for* should be placed over caring about, which is 'morally important because it is instrumental in establishing the conditions under which *caring for* can flourish' (Noddings, 1999, p. 36). Acknowledging Noddings' distinction between *caring for* and *caring about*, Tronto (1993) uses it to present four stages of the caring process. Rather than excluding care about persons from ethical care, she views 'caring about' as a necessary but insufficient precondition for fully realized care. "Caring begins with *caring about* (stage 1), identifying a need as one that ought to be met. Care progresses to *taking care of* (stage 2), assuming the responsibility for meeting the need. It moves to 'care-giving', directly meeting the need, analogous to Noddings' *care for* (stage 3). Then, the process culminates with *care receiving* (stage 4), as the recipient of care responds. Here, too, the personal nature of care ultimately remains fundamental – as it must, for as long as we *care about* the other, they remain generalized rather than concrete" (Liedtka, 1996, p. 184). In short, caring as a successful process based on successive, developing stages defies generalized and problem-solving approaches. In fact, it must always be interpreted as an investment in interpersonal relationships of which one becomes aware at – and acts properly from – a subjective level, due to the uniqueness of perceptions and lived experiences of the individuals with whom we see ourselves as having relationships.

In describing care as a practice, Tronto (1993) emphasizes its concern with both thought and action directed towards some end and dependent upon the resources of time, skill and material goods. Contrary to the stereotypical view of caring as fostering dependence, her research interests are addressed to its ability to empower the *cared for*, that is, to respect the other's autonomy and to work to enhance the ability of the cared for to make his or her own choices well. The very existence of care as a long-term practice, however, rests on mutual acceptance of the other in his or her current state as one capable of growth (Liedtka, 1996). Care is focused entirely on persons, not on 'quality', 'profits' or any of the other types of ideas around which much of today's 'care-talk' in organizations seems to revolve. It has to be undertaken essentially as an interpersonal process aimed at growth-enhancing the full capacities of the '*cared for*' to empower themselves according to defined needs and aspirations (Liedtka, 1996).

Finally, another aspect to consider is the recognition that care as practice must not be treated as an isolated process but as a part of a larger caring system, that is, as a 'community of mutual aid' (Herman, 1993). In such a caring system, the development of a capacity to care, or to *care for* others, is fully attained only when members become aware that helping each other is the only way to advance the caring process. Particular relationships between individuals, therefore, derive their shared focus

from the needs of that community, and become sustainable only by nurturing self-reinforcing cycles of care involving personal investments of care by each community member.

THE CARING ARCHITECTURE OF NON-PROFIT AND THIRD SECTOR ORGANIZATIONS

If care may really support an alternative moral conception of the firm in which activities and outcomes rather than profits and self-interest take the lead, how might this ethics be different in practice from the conventional managerial view? What does it mean, in concrete terms, to *care for* others, whether they be users, employees, suppliers or other stakeholders? Broadly speaking, is it possible for an organization to *care for* others, in the *feminist* sense of the term?

Liedtka (1996) offers an interesting reflection on the preceding decade of feminist writings, advancing an original reading of the problem of promoting care as a comprehensive moral theory of stakeholder management. Liedtka (1996, p. 185) introduces a conceptual framework for approaching and developing the study of 'caring organizations', with the aim of expressly defying the easy managerial fads and business-like 'talks' that usually arise when ethical issues are raised in the firm. For Liedtka (1996, p. 196), attempting to inspire 'caring organizations' to a heuristic design of principles and practices would help scholars to address dialogues and debates to stimulate operationally meaningful translations of these ethical concepts into the managerial domain. The starting point of this reasoning is the recognition that 'caring organizations' are something more than an assembly of caring individuals, and that organizations never care alone but always as part of an all-embracing 'community of mutual care' nurtured by shared goals and resources, human skills and networked infrastructures designed to support care efforts over the long term (Liedtka, 1996, p. 187). Based on this recognition, Liedtka (1996, pp. 192-197) addresses her analysis to the following founding elements of an ideal 'architecture of care' that is able to enhance the moral quality of a firm in the market:

- Decision-making openness, since the reach of care is determined as much by sphere of influence as it is by proximity, not decision-making by conformity with rules. 'Caring organizations', therefore, cannot be bureaucracies or large corporations, because hierarchy and managerial compliance are keys of organizational survival in bureaucracies, wherein the 'superior' becomes internalized as the only 'other' worthy of concern;
- Decentralization of power, to allow managers and employees the 'reach' necessary to care autonomously and on an on-going basis. This would entail the creation of an organizational web of connections, in which the focus is on the proximal nature of mutual

and horizontal relationships with key organizational stakeholders rather than on the position of 'boxes' in a hierarchy;

- Engagement of managers and employees as team-focused members for increasing the purposefulness of organizational values and goals;
- Internal communication, shared expertise and continual renewal of the firm's objectives by entailing a dialectical approach to decision-making properly handled through dialogues and the search for consensus;
- Small size, to favor decentralization of power and boost collective voice.

Accordingly, the author states that a firm bounded both by its own reach of care and the need to be competitive would have a responsibility to care 'for those in proximity to them who have needs that they are especially well-suited, by their capability to base, to fulfil, where giving such care does not act against their own needs' (p. 196). To paraphrase Wicks (1996, p. 528), therefore, to be in keeping with care implies that any 'entity', whether an individual or an organization, 'must be intimately connected with the stakeholders who make up the firm and the arrangement they use to shape their interactions'. This point has special reference for those stakeholders who are in a position of proximity to the organization and for the ways in which they direct effort at the corporation without doing harm, or acting against, their own needs and interests. As Liedtka (1996, p. 196) argues, '[...] the focus on care is also upon needs, rather than interests. Self-care is also important, so that I do not have responsibility to give care where to do so would be of significant harm to me'. This suggests that setting the boundaries of care is an exercise that serves not only to enhance the inherent moral qualities of the firm, but also to offer logics and a mechanism for evaluating the substance and health of its stakeholder management.

If the idea of the firm as a caring organization exists as a possibility, and if it really might sustain competitive advantages, then non-profit and third sector organizations may be conceived as significant 'organizational exemplars' trying to set the boundaries of care and envisioning 'what' and 'how' an organization designed to *care for* in a fully reciprocal sense would look like in practice.

To support this moral inquiry, we focus our attention on four founding organizational attributes that are especially promising in order to provoke a meaningful conceptualization of *caring* in non-profit and third sector organizations that could simultaneously enhance both the effectiveness and the moral quality of public service providers. We refer specifically to the following attributes: (1) the embeddedness in third sector environments; (2) social purpose; (3) social ownership; and (4) stakeholder engagement.

Third sector environments

European third sector economies are usually depicted as highly complex and regulated environments with blurred economic and societal boundaries comprising multiple local actors, including public authorities and civil society. In these environments different mixes of solidarity and civic virtues, public regulation, competition, and several social expressions converge for the planning of social and community-based services (Evers, 2004).¹ In essence, these mixed environments are outlined as socio-political spaces based on the preservation of power and resources and that monitor and enforce mutual expectations and co-operative efforts (Evers, 2006). This may well convey the impression of institutional environments in which the identification and pursuit of the collective interest are shaped by collaboration and mutual trust among societal participants.

Social purpose

Addressing care morality to a social purpose, instead, may lead many conceptual and practical challenges subsequent to the underlying uncertainty about the social quality, or nature, of such a purpose. The heterogeneity of organizational forms underlying European third sector environments opens up almost unlimited approaches for the identification of social purposes. If we look at the definition of social enterprise proposed by the U.K.'s Department of Trade and Industry² – one of the most accepted in the European literature – the primacy of social objectives is seen as a defining characteristic, with the generation of funds (profit) being a means to further the social purpose. The use of the adjective 'social' as a qualifier of the term 'enterprise' raises serious concerns about which typologies of organizational objectives can legitimately be considered social – not to mention to what extent a given organization may actually advance those social objectives. In order to resolve the point of care referred to the social enterprise's social objectives, it would remain essential to understand what 'social' means in the specific contexts of the social enterprise and how these social objectives differ in nature and extension from the two extremes of the 'for-profit' business and pure 'non-profit'

¹ Although specifically referring to the emergence and institutionalization of social enterprise, Pearce (2003) has proposed a reasoned and exhaustive categorization of European third sector markets based on three distinct fields of service delivery in the local community:

- Local development and community regeneration (managed workspace, enterprise training programs, green services, social business advice and support, and infrastructure regeneration);
- Partnership with the State for the outsourcing of local public services (e.g., housing, leisure and recreation, health and social welfare services, childcare and domiciliary services);
- Community-based services in response to local demand, with a special focus on the promotion of work-integration initiatives and employment-development schemes for socially disadvantaged groups.

² "A social enterprise is a business with primarily social objectives whose surpluses are principally reinvested for that purpose in the business or in the community rather than being driven by the need to maximize profit for shareholders and owners" (DTI, 2002, p. 13).

firms. In our opinion, discussing social enterprise – or, more generally, non-profit and third sector organizations – without acknowledging the possibility of fundamentally divergent social objectives makes little or no sense. ‘Sociality’, that is, the quality of being social, inasmuch as an organization intentionally and effectively pursues the advancement of a social purpose, is a contested and problematic concept in the literature that seems to remain inextricably linked to a variety of potentially incompatible value systems and normative commitments (Nicholls and Cho, 2006). Sociality can be meant both in subjective (related to organizational ends and purposes) and objective (related to selected fields of action) terms. Organizations delivering human services, such as health and social care, education, housing, or other services to the community, clearly reflect an intrinsic commitment to a socially responsible behavior in both subjective and objective terms. Further, this orientation to sociality can range from mutuality to pure solidarity (or altruism), though it often finds expression in a combination of these two principles of action. Addressing care morality to the social purpose, therefore, seems to reach the heart of the debate about the moral foundations of social responsibility in non-profit and third sector organizations. However, this issue seems inevitably confined to a subjective exercise, resting essentially on judgments and evaluations dependent on personal attitudes and cultural values that are inextricably associated with a particular individual’s or group’s own social sensitivity with regards to specific acts or given, situated contexts.

Social ownership

Social ownership is one of the most distinguishing attributes conveying caring traits to non-profit and third sector organizations. This can be defined as a private form of collective ownership by stakeholder members or basic constituencies that basically control the organizations in order to prevent or limit the exploitation of financial surpluses and corporate assets (Pearce, 2003), or, more generally, the pursuance of divergent purposes. Many types of social ownership have an open, voluntary and formally democratic structure that is regulated to ensure co-operative advantages among the member constituents. Bratman (1992) identifies the principle of mutuality based on tripartite aspects of mutual responsiveness, commitment to the joint activity, and mutual support for the common action. These are the basic rules governing social ownership. Such organizations, by their very nature, have a participatory and highly decentralized decision-making process, facilitating internal communication, openness to dialogue and consensus building among member constituents, managers and staff. Further, the democratic governance inherent in the social ownership of many non-profit and third sector organizations, such as voluntary organizations and ‘member-based’ social enterprises (e.g., co-operatives and mutual organizations), usually provides member constituencies with voice and influence, if not the formal allocation of voting rights. Following that comes a strong

sense of collective ownership and common identification with the values of equality, equity, and democracy.

Stakeholder engagement

One of the major tasks of the stakeholder approach is not just to simply identify who matters or who should be considered a stakeholder, but, instead, to seek boundary constraints that can clearly define who might not be considered a stakeholder at all (Mitchell, Agle and Wood, 1997). As previously argued, conceptualizing care morality in order to seek boundary constraints to properly address 'organization-stakeholder' relationships and searching for effective ways to influence the resulting activities and decision-making, are tasks intimately connected with the specific nature of the relationship-building established in given institutional environments.

This theoretical insight suggests that we try to sketch an all-embracing framework of methods of stakeholder engagement suited to non-profit and third sector organizations, which may hypothetically range from conventional methods of stakeholder engagement to the management of differentiated forms of stakeholder involvement in organizational activities, even to the extent of creating 'multi-stakeholder structures', also known as 'multi-stakeholder governance'. This mixed attitude towards stakeholders can be easily observed as inherent in many such organizational forms, mainly voluntary organizations and social enterprises, which provide local public services (such as human services). Indeed, it is quite common to observe, for example, members and key stakeholders of voluntary organizations and social enterprises – such as staff, users, and volunteers, along with other local stakeholders – taking part in board meetings and 'having a say' in decision-making, as well as involving citizens and community stakeholders in the service-delivery process in various ways to enhance user co-production (Brandsen, and Pestoff, 2006). Further, it is worth emphasizing that many of these organizational forms tend to evolve into 'multi-stakeholder structures', that is, organizations which advance stakeholder engagement from a set of informal or specific practices under strict managerial design and control, to a new one based on the formalization of rules and mechanisms of stakeholder board representation.

In sum, stakeholder engagement in non-profit and third sector organizations leads us to distinguish among four distinct – not mutually exclusive – operational logics that ideally range from 'external information' (minimum engagement) to 'multi-stakeholder structures' (maximum engagement; adapted from Gijssels, 2009):

- 'External information', typically addressed to key environmental stakeholders, often involving minimal or no information disclosure to other stakeholders;

- 'Informal involvement' of key service stakeholders (i.e., communication, dialogues and meetings to discuss service issues, often with little or no chance for them to influence decision-making);
- 'Formal involvement' in decision-making, which requires managerial design and control skills at different stages of the process, from identifying the principles of stakeholder engagement and the matters at stake to choosing the method, allocating voting rights or 'having a say' options, measuring outcomes, and auditing;
- 'Multi-stakeholder structures', by which key stakeholders are formally represented on the board and/or are entitled to join the membership.

With regards to the latter, two main definitions can be found in the specialized literature. On the one hand, Pestoff (1995) stresses the importance of 'multi-stakeholder structures' only in terms of stakeholder board representation. Such a form of stakeholder representation is typical of nonprofits and charities, that is, of organizations where staff, volunteers, donors, and other key stakeholders are formally represented as a board of advisors or constituency stakeholders. On the other hand, Borzaga and Mittone (1997) explicitly define as 'multi-stakeholder structures' those organizations where stakeholders are supposed to be at least members or co-owners of the firm. Such a form of stakeholder representation specifically refers to member-based organizations, like mutuals and co-operatives, with a membership (or ownership) that is formally open to the co-existence of multiple stakeholder groups who hold salient interests in taking part in decision-making and benefit from sharing in the organization's results.

According to these definitions, the nature and functions of care would be better justified by reason of 'social proximity' that affects the relationships with those stakeholders who take part in the organization's processes and get some benefit from sharing in organizational outcomes. The suggested process of setting the boundaries of care, therefore, would also require attention drawn to those interpersonal and fiduciary attributes affecting stakeholder relationships that enable us to reinforce a vision of non-profit and third sector organizations as abler to *care for* the others in the full, reciprocal sense.

The specialized European literature on third sector organizations as providers of local public services and, more specifically, of human and welfare services, offers quite a bit of evidence on user benefits and improvements resulting from the involvement of key stakeholders in the service co-production. These are mainly pursued by sustaining user dialogues, further suggesting that users have a more effective voice when commitment to service change is critical, and when it relies mainly on customization and user attitudes (Pestoff, 1998, 2006, 2012; Fazzi, 2012; Verscheure, Brandsen and Pestoff, 2012). As a matter of fact, mutual trust, reciprocity and the nature of 'social relatedness'

inherent in relationships with service users, for instance, are all self-evident traits that clearly also reveal the potential reach of care in terms of service quality and effectiveness. A 'caring interpretation' of user empowerment, indeed, can be revealed in the aim of strengthening users' knowledge, making them aware of their own experience and taking into account their views and voice on the service delivery system. Finally, caring virtues and attitudes would seem to be fully appreciated when focusing on the social networking that such organizations are able to establish and nurture with local citizens and the civil society. This informal networking is essential for bridging relational capital and other voluntary resources at the grassroots to sustain the service delivery. Likewise, it is often considered a key resource to enabling efforts aimed to democratize local welfare systems by enhancing citizen participation in the co-planning of social services (Verscheure, Brandsen and Pestoff, 2012).

To *care for* others in a fully reciprocal sense and to be concerned for all the relevant interests at stake – at least to the extent that they do not harm their stakeholders – seems as obvious and tacitly accepted when reflecting on the moral legitimacy of stakeholders and the responsibility principle in non-profit and third sector environments. This would also be of special relevance to improving our understanding of the role of 'virtue ethics' as a normative approach enhancing a stakeholder conception of organizations as relational entities. In this view, organizations appear not only as by-products of a set of formal and informal agreements among key stakeholders, but also as foundational parts of a more extensive and evolving social network of collaborative relationships and co-operative efforts.

CONCLUSION

The legitimacy crisis facing European third sector environments has deep ethical roots. It urges management scholars to delve into ethical disciplines, approaches and languages for rediscovering the moral sources affecting stakeholder legitimacy and the responsibility principle. This needs to be conducted in a way consistent with helping organizational members, staff, managers and other key stakeholders to better understand what it means to reason – and what really counts when reasoning – with real facts and decisions from a value-laden, moral viewpoint. The ethical thought best epitomized by 'virtue ethics', as opposed to the business-like 'ethics of justice', would seem most to the point, helping to advance our knowledge of the moral foundations of non-profit and third sector organizations. Specifically, the language and method of care, with its special focus on both the dialogue and the reciprocal strengthening of interpersonal relationships as a primary means of moral deliberation, proves to be sound and defensible thought to enhance proper justifications of the moral legitimacy affecting the notion of stakeholders, and 'organization-stakeholder' relationships, in

European non-profit and third sector environments. As we have noted, the attitude to care would seem clearly visible in terms of stakeholder engagement by non-profit and third sector providers of local public services, especially in the 'multi-stakeholder structures' delivering human and welfare services for the community. Indeed, care morality would seem to affect mainly those stakeholders who are in 'proximity' with service users, that is, those stakeholders who have salient interests in taking an active part in the service co-production process, and benefiting from sharing in the organization's outcomes.

However, at least at the current stage of research, we cannot know for certain that the moral grounding of care is the best normative theory conveying meaningful interpretations of the moral legitimacy of stakeholders in third sector realms. Once an intrinsic moral commitment to the principle of responsibility is supposed, several additional questions need to be addressed in order to reach the potential of care morality. What combinations of stakeholder practices might efficaciously manage and balance an organization's multiple objectives? How can stakeholder practices be integrated into a governance system? How should divergent stakeholder interests be balanced without doing harm or acting against them? How should boards address the potential conflicts arising from key stakeholders?

Little attention has been so far paid to conceive of care as a comprehensive moral theory of organizations. One critical explanation for this is that care morality has been contextualized only in the business realm for approaching decisional conflicts or teaching managerial dilemmas from an alternative ethical perspective. It has been used in business discourses to maintain distance from the dominant ethical thoughts on justice. Specifically, it has been developed with the prior concern of showing that the best way to understand and teach morality is to focus on the complexity of a single business issue, making use of languages and methods that try to select and isolate the caring attitudes and meanings inherent in the mutual and interpersonal aspects of 'organization-stakeholder' relationships and decision-making (Burton and Dunn 2005). Unfortunately, ethical reasoning and judgements in business studies have always been conveyed by focusing on specific facts or strategic decisions related to relevant business issues in large corporations, often adopting a strictly masculine language dominated by concepts such as self-interest, leadership, competition and profit maximization. By contrast, studying 'organization-stakeholder' relationships from the viewpoint of those key stakeholders who are in 'proximity' to – and take active part in – the service co-production process could be a useful starting point to make morally sound interpretations of the human virtues and moral qualities of non-profits and third sector organizations as effective public service providers for local communities.

The proposed framework of care morality should hint to scholars that feminist language, methods and principles of care need to take on more relevance in the study of the moral obligations and fiduciary duties of organizations. The necessity of a moral stance on stakeholder orientation is a claim largely shared in literature; the ways in which this can be inflected in any specific culture and/or context, though, are open to debate. The hypothesis can be made that specific ethical theories are abler than others in any given environment or situation for interpreting people's ethical motives. Largely similar ethical behaviors can be traced back to different sources, according to people's sensibilities and ways of thinking, the specific context within which 'organization-stakeholder' relationships are enacted, and the specific values deposited in the organizational culture. This leads us to claim that further theoretical speculation on care and, more generally, on stakeholder thought is still required. Above all, much comparative fieldwork directed at examining concepts and ideas affecting ethics and the responsibility principle in current European third sector economies is essential.

PATENT RIGHTS MANAGEMENT: PROTECTING OR SHARING KNOWLEDGE? A POSSIBLE SOLUTION

Marsigalia, Bruno; Buttarò, Tiziana; Celenza, Domenico; Palumbo, Emanuela

Department of Economics and Law, University of Cassino and Southern Lazio, Italy

ABSTRACT

The strategic role that intangible assets, and especially innovation, play in the corporate value-added process has recently been growing. Thus, our work purpose is to investigate the most efficient intellectual property management strategy, with a special regard to patents, since they are an archetype of technological protection. Analysis of patents enables us to understand *if* and *how* IP rights improve market competitiveness, thanks to the information's protection. The survey considers IP as a given, because the regulations that allocate economic monopolies to the inventors are yet irreversible, in opposition to the literature orientation supporting the theory that knowledge protection would be a boundary to innovation. Moreover, being impossible to ignore the actual economical trend named "massive collaboration", the research develops a knowledge management paradigm to define the most efficient way to exploit patent rights.

Keywords: *intangible, value creation, innovation, intellectual property, patent rights management, full-exclusion strategies, open access, limited-exclusion strategies, patents licensing.*

1. INTRODUCTION

Companies consider intellectual capital as a key factor to succeed in the long term, because of the growing complexity of the socio-economical environment (Edvinsson and Malone, 1997; Foray, 2006; Rifkin, 2001; Sveiby, 1997). Amongst the intangibles, a strategic role is played by technological innovation, which is a part of the structural capital (Stewart, 1999). It is widely recognized that process innovation is one of the main strategic tools that a firm has to differentiate itself from competitors (Shumpeter, 1942).

Focusing the analysis on innovation, we found that one of the firms' main goal is to *protect* the information coming from the inventions, together with *producing* new knowledge. Thus, having intellectual property results a positive impact on how market players act, grow and compete (Lev, 2003; Teece, 2000), it is obviously considered a source of value production.

The survey focuses on patents, because they are the archetype of knowledge protection of an invention. Therefore, it is necessary to investigate patent dynamics to reveal *if* and *how* patent rights improve market competitiveness thanks to the protection of the technological information. In fact, if on one hand patents grant the exclusive rights to the inventor (the faculty to prevent others from doing the same activities/processes), on the other hand they are an important tool to regulate the market. If that tool would be not efficiently managed, it would result in a threat to the knowledge creation process.

Moreover, the importance of those features is even more pressing within the economic trend named “massive collaboration”. An ever-growing number of people are contributing to innovation and to value creation in several economic areas, with an “open” approach, which seems likely to transform every institution of society.

Given the above, the present research investigates the possible strategies developed to manage knowledge and offers an efficient paradigm of control, which would define the best utilization of the patent rights.

In paragraph 2, we describe the motivations for building a strict information protection system, while in paragraph 3 we analyze the reason for knowledge management based on an open style of approach.

As it is impossible for the authors to conclude that one style of knowledge management (if protecting or sharing information related to a discovery) is the most efficient, in paragraph 4 we present the limited-exclusion strategy as the optimum tool for control of the company’s knowledge assets.

In paragraph 5 we develop a possible paradigm of knowledge management which would better work to obtain the most efficient promotion of the patent rights.

Finally, paragraph 6 presents the authors conclusions on the topic and survey’s implications.

2. THE PROTECTION OF KNOWLEDGE AND FULL-EXCLUSION STRATEGIES

The field of Research and Development is the main tool that the companies can exploit to gain and preserve a competitive advantage. For ages, it has been considered possible to manage processes in terms of “property rights”, which create a real entrance barrier for new competitors and are the key factor in obtaining a competitive advantage.

Basically, that model is based on the assumption named “closed innovation”. A competitive advantage is a direct consequence of the growth of an entrance barrier. Those barriers are both *organizational*, due to the R&D functional emphasis, and *financial*, because of the investments required and the intellectual capital protection, which is a significant strategic driver.

Thus, one part of the literature supports the thesis that the protection of new ideas would have several benefits.

First of all, allocating property rights to the inventions would be an important tool to promote innovation, since an economic return is granted for investors through the price mechanism (Trequattrini, 2008).

Secondly, the need to ensure a certain return to the inventor for the discovery, would avoid the market failure dynamics involved when knowledge is expressed as a *public good*. It is a well known that the definition of the public goods includes some characteristics like the *non-rivalry* and the *non-excludability* of the good itself. Combining those features, we identify the origin of the so called *free riding* phenomenon, where the economic players tend to reduce the investment in a public good, since they can exploit some other people's investments.

Another advantage of the institution of patents is the dissemination of knowledge. The patents systems are designed so as to make the inventors reveal their discovery's contents through detailed technical documentation. That compulsory disclosure of the technological information would help the diffusion of new innovative ideas and promote a boost in technological development.

On the other hand, those considerations are contested by an opposite theoretical orientation, that supports the belief that the institution of patents would not be justified, because of the divergence between property in ideas and property in tangible goods.

In fact, tangible goods are seen as property rights because of the shortage of those goods, thus avoiding possible conflicts (Hoppe, 1989).

The ideas, instead, are not a scarce resource: using someone else's idea will not prevent the original inventor's usage, thus avoiding the threat of conflicts. When someone claims the right on an idea, an artificial and unfair scarcity is created (Bouckaert, 1990). According to that, ideas could not be considered as a property and its exclusivity would not be necessary. Intangible ideas, that have not yet been applied, would be like some books into Babel's library, because they are socially useless because inaccessible.

So far, we can claim that a first disadvantage coming from protecting knowledge would lie into the unjustified enrichment of a private person – the inventor – and in the social damage resulting.

In this regard, Boldrin and Levine (2002) underline that intellectual protection is useless because the market is able to pay off the entrepreneur's production costs without the need to allocate some monopolies, thanks to the rights coming from the first sale.

Moreover, those that criticize the patents institution do not identify into knowledge protection an instrument to generate more innovation, but an obstacle to produce new ideas.

As Landes and Posner (1989) said, any kind of knowledge is itself something cumulative, because it comes from former knowledge already discovered and accumulated over time. Thus, an overexploitation of protection risks to limit knowledge diffusion and the learning accumulation process required to inspire other inventors.

Regard to this, Heller and Eisenberg (1998) define as «*tragedy of the anti-commons*» when knowledge fragmentation stops any kind of innovation process, because it destroys the equilibrium between past and present innovators. Any knowledge holder will tend to exclude other people from his research environment.

The economical reasons given by IP detractors would also be founded on the actual economical trend named “massive collaboration”, where knowledge management is based on an “open” kind of approach, which seems to be transforming every institution in the community.

3. KNOWLEDGE MANAGEMENT WITH THE “OPEN ACCESS” APPROACH

The industrial revolution involved both an economic and a knowledge revolution (Mokyr, 2004). In regard to intellectual capital and above all patents, the protection of ideas made the “privilege” of learning and testing useful knowledge extend further towards the middle classes. Using the returns on their inventions, they could invest in learning processes to improve their social status. Before then, only the aristocracy would have that privilege.

This encouraged the pursuit of a double benefit: on one hand, a greater technological progress took place, so as to support the city’s economic development; on the other hand, it increased significantly the individuals employed in the research field.

However, the previous function of patents during the industrial revolution seems not to exist anymore in the present socio-economical context, due to the formative role played by our educational systems.

Moreover, the collaborative economy would seem to support the view that such an institution is old fashioned, since there are some new organizational paradigms existing, such as the *peer production* (or *peering*). It is a productive system made by peers. By saying that we mean people or companies that collaborate with each other, using an “open” approach to promote innovation and growth in the business (Tapscott and Williams, 2008).

Massive collaboration is basically founded on the ratio that a large horizontal net of participants would spread group know how, capabilities and resources more significantly than a single company could do. To access other people’s knowledge within peer production means the traditional kinds of intellectual property are totally overturned. The production communities use general public licenses

to grant the right to share and modify the creative works for the users, as long as every modification is shared with the community (Benkler, 2006).

It is worthwhile to underline, though, that a sharing strategy is not free from limits and criticalities.

First of all, such a radical change as the massive collaboration, is frequently accepted with some skepticism, bringing an uncertainty factor (Tapscott and Caston, 1993). The top management could barely imagine a world where their companies would lose control of their monopolized sources. That is the reason why so many companies consider information sharing as a threat and choose to obstruct it, rather than accept it.

Secondly, the detractors of the open-source believe that a collaborative economy is “flattening culture” (Friedman, 2007), because of a great participation of amateurs in creative activity. That confused and anonymous “massive mediocrity” would risk to compromise the highest level of quality and originality and, finally, damage the true talent.

Furthermore, the general public opinion shows how the “knowledge producers” are increasingly less incentivized in a world where individuals can join their talents to create free goods for competing with the proprietary goods offered on the market. Basically, the intellectual property sharing is a potential threat for the free market and for the right to realize a profit in the *knowledge-based* areas.

However, there are also some extreme theoretical orientations which support that a more open and independent world, which would be more potentially dynamic and active, but also more exposed to terrorism and criminals.

4. PATENTS STRATEGIC MANAGEMENT THROUGH LIMITED-EXCLUSION STRATEGIES

The opinions described in the above paragraphs suggest that efficient knowledge management would not rely either on a total opening or on a total privatization of the information involved in a new inventive creation. In fact, the analysis revealed that a significant amount of limits and opportunities belong to both strategic approaches. Thus, we can support the thesis that the fairest knowledge management is a good mix between protecting and sharing knowledge.

It would be appropriate, therefore, the introduction of an incentive system to reward the inventors and the knowledge producers and to encourage them to spread the results of their works widely. In such a scenario, an optimum knowledge control might be based on “*limited exclusion*” strategies (Palfrey, 2012), through the grant to third parties (i.e. the purchase by third parties) of patent licenses. Basically, a licensing strategy would help pursue a double benefit (Ghidini, 2009):

- to let the patent’s owner transform the R&D field in a profitable centre thanks to a wider and more efficient monetization of their patent portfolio;

- to promote the offer of new ideas and inventions developed by the firm, that have not been used yet because of the cost of realization or because they were not appropriate to the brand image or company's strategy.

At the same time, companies that are willing to increase their competitiveness on the market can purchase a technological innovation by the inventor. So, companies would provide solutions to problems that have not been solved internally, for some reasons related to costs, timing or a lack of experience.

Considering all those advantages, we can claim that protecting knowledge assets would make firms more inclined to collaboration, even though – at a first glance – we could have seen an ideological conflict between IP rights and the theoretical economic principles based on the sharing of learning. That would actually realize a more “balanced” intellectual property management: firms do not have to renounce to potential patent rights, but they have to share some basic elements of them so as to introduce on the market some innovations that would otherwise not be realizable, and with a faster timing.

So, protecting personal assets with IP rights would become a prerequisite at that point. In fact, despite the limits involved in a full-exclusion strategy, something that does not belong to anyone cannot be transferred (Palfrey, 2012).

Moreover, considering IP as a significantly valuable strategic asset, we could find also other benefits. First of all, the allocation of intellectual property rights solves the so called «information paradox» by facilitating knowledge transfer and commercialization (Arrow, 1962). The paradox is the following: pure information—which is a *non-rival* and *non-excludable* information – can turn into economic value only when it is revealed; but, when it becomes public, its value turns into zero because anybody can use it without any cost. Thus, it is extremely difficult that a market for goods that have the characteristics of pure information can exist. It is obvious that the presence of this paradox makes useless minimal economic incentives to invest to realize the innovation, because it is impossible in practice to transform a personal innovative idea in economical value. The precise IP rights allocation, if negotiated, would solve the information paradox, facilitating the existence of a knowledge and innovation market.

Secondly, the claiming of IP rights would become like a “shield”, since it would offer to inventors the freedom to develop more products.

Finally, in the company's evaluation, the IP rights value is just as important as other asset classes' value. So, by having a positive impact on the company's credit standing, intellectual property assumes a fundamental role into external financial processes of the firm (Faccincani, 2009).

On the other hand, using only information protection is not enough to promote more innovation processes: some sharing learning is necessary. It would seem, in fact, that innovation leads to a significant amount of patents, but a greater number of patents, with full exclusion strategies, would not lead to a wider innovation.

In such a scenario, an IP licensing strategy would represent the most efficient knowledge management to gain a long term advantage. The reason for preferring licensing strategies rather than privatization strategies is actually the gain of economic returns and competitive advantages on a medium-long term perspective. Instead, privatization is a response to the drive for short term wealth creation.

5. THE FAIR BALANCE BETWEEN KNOWLEDGE PROTECTION AND SHARING: TOWARDS A POSSIBLE SOLUTION

Even though licensing advantages are understood, it is worth underlining that an efficient IP management should not disregard the need for a certain *dynamic* and *flexible* approach. In fact, in an optimal knowledge management paradigm, each of the strategies analyzed could play a crucial role, because each one could be needed to satisfy some particular needs.

A *full-exclusion* strategy would be efficient against the competitors offering very similar goods and services, although they differ slightly. That efficacy, however, would rely on the presence of two conditions:

- the lack of any IP violation by the competitors;
- a certain width of the good's life cycle.

Regarding the first condition, it is known that nowadays by the excessive tendency of companies to protect any technological item discovered, and by the subsequent lawsuits in defense of the same, is derived a waste of money. That waste appears not to be justified as for two kind of reasons. First of all, it would make the products' prices rise so to have a final negative effect on consumers; secondly, they would slow down the technological advancement, since the legal expenses sometimes overcome the R&D investments (Bessen and Hunt, 2007; Levine and Saunders, 2004).

About the product life cycle, an efficient management of intellectual property should consider the phase where the technology is positioned, following the phases of its development path (Chesbrough, 2006). In the initial phases of a new technology (initial development and growth), firms should invest in intellectual property creation and choose the best way to protect it, by strongly developing its technology. In the maturity phase, companies should search for new technological applications in the emerging sectors of the industrial field, but also in totally different fields. Thus, a more restrictive IP strategic approach could not support different technological applications in different usages in that

phase. In fact, a company holding IP rights could be characterized by the scarcity of innovative processes, since the decision on *how* and *when* to innovate is taken by some external organizations.

On the other hand, companies agreements for IP sharing would support the so called “*generativity*” of the existing technologies (Zittrain, 2008), which is the realization of further innovations, thanks to the improvements done by several actors, external to the patenting company.

Therefore, a full-exclusion strategy could be extremely dangerous, because of a strong decrease in the products’ life cycle, being in an economic phase with integrated markets and a more and more dynamic competitive environment.

Thus, it would be appropriate to claim that full-exclusion strategies would be efficient to pursue the *short term profitability*. That is how *limited-exclusion* strategies would take place, whose benefits are not only monetary, but also strategic, such as the generation of alliances for eliminating or reducing the limits of a knowledge closed approach.

In that direction, *cross-licensing agreements* are a strategy that companies should take under into serious consideration (Raysman *et al.*, 2011).

A first benefit of that approach is the possibility to prevent or solve the legal arguments for violation of third parties patents. That also avoids the danger of utilizing a huge quantity of financial resources in legal disputes, rather than in R&D activities. They also encourage the businesses to innovate with more freedom.

Moreover, cross-licensing agreements would help promote technological progress. Firms involved in the contract are able to access to patents of others and, therefore, to information that would be otherwise secret. That will help introducing possible technological development, which is often limited by the knowledge fragmentation associated with “patent thickets” (Choi, 2010; Shapiro, 2001). Another advantage of the cross-licensing agreements is the reduction of variable costs, especially those of production and negotiation (Lennon, 2008).

Thus, a limited exclusion strategy would better work to satisfy the *innovation* and *medium-long term liquidity* needs: limiting the right to exclude somebody else from the proper IP, would facilitate a faster development of the technological horizons.

Finally, an optimum model of patent rights management involves the *open access* approach, that could be essential when *necessity* and *equity* needs have to be satisfied, such as public health needs.

Often, the observers point out that the only industry where patents would literally have a fundamental role when launching new products on the market is the pharmaceutical field, because of the high fixed costs of innovations. So, in that field, the decrease of incentives for creating new drugs could appear very dangerous (Carrier, 2004).

The excessive costs of new medicines, though, facilitate their access only for the consumers in wealthy countries. Thus, many people support the end of patent rights for the poorest countries, where the multitude of diseases represents a more dramatic and urgent issue than the high cost of the drugs in the more technologically advanced countries.

Some radical changes would be required in such a scenario, like instituting a prize system whereby governments pay pharmaceutical companies a prize for their developments instead of granting them patents rights (Fisher and Syed, 2010). Another solution is the use of “*Equitable Access*” licenses (Kapczynski *et al.*, 2005), whereby patented information is available for free use in certain contexts, such as in that of access to lifesaving drugs in developing countries.

The model of patent rights management proposed is illustrated in the following matrix (figure 1)

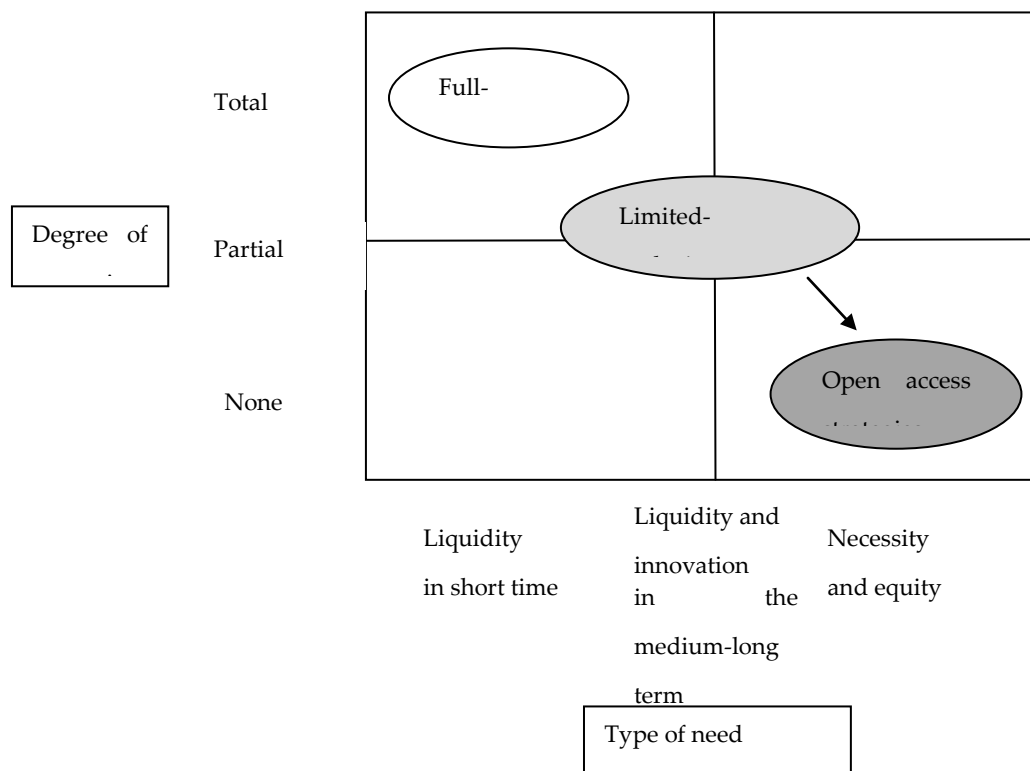

Figure 1. A possible model of patent rights management

Given that, we can claim that – due to the short term advantages come from a full-exclusion strategy – the most efficient intellectual property paradigm of control would be based on limited-exclusion strategies, which aim to an open access management in order to ensure a larger diffusion of the saving-life drugs. We should start to think about how the law of intellectual property can evolve over time in the public interest.

6. CONCLUSIONS

The research results are that the most efficient patent rights management system would appear to be an efficient mix between knowledge protection and sharing. In fact, both full-exclusion and open access strategies analyzed involve some opportunities, but also a certain amount of dangers.

In particular, we can state that optimum mix should be meant as in a double perspective:

- in a strict sense, because of the *limited exclusion strategies*' crucial importance;
- in a broad sense, since there is a *strategic turnover* between the closed, open and mixed knowledge management, in response to the specific needs of the situation.

While discussing the first feature, about the crucial relevance of limited exclusion strategies, we pointed out the strategic function played by licensing activities. In fact, the patent transaction would create several benefits both if the company owns the patent and if the company is the "licensee".

Thus, the best model for knowledge management would appear to be the "*Open Innovation*" paradigm, introduced by Henry Chesbrough in 2003. It is based on the participation and cooperation between organizations – private and public ones – to promote some innovative ideas useful for the market. That model describes value creation as a variable not only dependent on the internal transformation of inputs in outputs (as described by the traditional innovation model), but rather as a smart and efficient combination between external and internal resources. In fact, the Open Innovation paradigm claims that businesses could and should adopt external ideas as well as internal ones, in order to improve their technology; also making the other firms able to use their unused ideas (Chesbrough, 2003).

Thus, a fair mix between protecting and sharing technological knowledge is the only way of realizing an efficient knowledge management process. So, patents would not be considered only as assets within the balance sheet, but also like some *negotiable goods*, using an efficient knowledge management paradigm. Thus, there would be a double usefulness of protecting rights for companies: to hold know-how themselves and to be able to transfer the innovative information to attract potential partners. The mutual relationship would be realized through their selection, which would be based on the property rights portfolio and on the potential complementarities.

To answer to the research question of the survey, we intend to underline that the balanced mix between protecting and sharing knowledge would not be realized only by using a *limited exclusion* strategy, but instead by implementing a "flexible" managerial approach. On the authors' opinion, the most efficient knowledge management would be the implementation of a model that would allow a

company to catch the opportunities and to manage the risks that belong to a certain phase of the company's life or to a certain industry. Thus, the optimum patent rights management model implies the *alternation* of closed, mixed and open strategies, rather than adopting only one of those strategies.

In this regard, the paradigm developed showed how full-exclusion strategies fit perfectly the short-term liquidity needs. Limited-exclusion strategies, instead, eliminate the limits of the closed knowledge management and, furthermore, they appear to satisfy liquidity and innovation needs in the medium-long term. Finally, an open-access strategy finds its fundamental ratio in the accomplishment of equity needs, which are needs higher than the necessity of any form of protection.

In conclusion, we can say that both full-exclusion and open access strategies do not represent a solution to the general issues concerning a certain kind of business, but they are rather two approaches complementary to systems where reaching a good balance between the public foundations and the private firms represents the main goal to let the companies and the markets hold a long-term competitiveness (Tapscott and Williams, 2008).

DOES COUNTRY IMAGE AFFECT CONSUMERS' WILLINGNESS TO PATRONIZE ETHNIC RESTAURANTS?

Martinelli, Elisa¹; De Canio, Francesca²

¹Department of Economics Marco Biagi, University of Modena and Reggio Emilia (UNIMORE), Modena, Italy

²Department of Economics, University of Ferrara, Ferrara, Italy

ABSTRACT

The main aim of this paper is to investigate the influence of Country Image (CI) on consumers' willingness to patronize (INTP) an ethnic restaurant. The research is conducted in a multi-cue approach, taking also into consideration the impact of the dining core service offer (COFF) on INTP. Specifically, a model in which CI, consumer ethnocentrism (ETN), country familiarity (CF) and COFF affect INTP is proposed and tested. As extant literature is mainly addressed at studying consumers' evaluations and purchase intentions of tangible products sourced from foreign countries, while the Country of Origin (COO) effect on consumers' perceptions and behaviors of services has rarely been examined, this study topic should be expressly interesting for advancing the theoretical and managerial understanding on the COO effect. This is particularly true in the case of dining services, taking into account the widespread market offer of ethnic restaurants and cafés that consumers are increasingly facing today. To test the proposed model a survey was performed. Data was gathered administering a structured questionnaire to a convenience sample composed by three hundreds individuals. Structural equation modeling (SEM) serves to test the hypotheses. The model shows a good fit and the proposed hypotheses are all fully supported. Theoretical and managerial implications are discussed.

Keywords: *Country Image, Consumer ethnocentrism, country familiarity, dining services, ethnic restaurants and cafés, French bistrot, core service offer, Italian consumers, SEM.*

INTRODUCTION

Consumers are increasingly exposed to an enlarging range of foreign products and brands. This acknowledgement has stimulated a strong and increasing scientific and managerial interest on the impact that the origin of a product in terms of sourcing country, the so-called Country of Origin (COO) effect, exerts on consumers' evaluations and behaviors (Papadopoulos and Heslop, 1993; Kaynak and

Kara, 2002; Roth and Romeo, 1992; Wang and Chen, 2004; Pappu *et al.*, 2007; Chattalas *et al.*, 2008). As a matter of fact, COO is considered as one of the most researched topics in international marketing and consumer behaviour (Peterson and Jolibert, 1995; Usunier, 2006).

Despite the richness of the COO literature, extant research is almost fully addressed at studying consumers' evaluations and purchase intentions of tangible products sourced from foreign countries, while the COO effect on consumers' perceptions and behaviors regarding services has rarely been examined. This is particularly true in the case of dining services whose literature is mainly focused on investigating customers' satisfaction and perceptions of service quality (Andaleeb and Conway, 2006; Weiss *et al.*, 2005) and restaurant attributes (Johns and Pine, 2002; Park, 2004) but is completely lacking, to our knowledge, in considering the COO role. Batra (2008) focused on foreign tourists' motivation and information sources influencing their preference for eating out at ethnic restaurants in Bangkok but do not consider CI in its analysis. Czarniecka-Skubina and Nowak (2014) investigated the popularity of Japanese cuisine in Poland and examined attitudes of Polish consumers towards it but, again, neglecting the CI role and the influence of COO cultural components. However, taking into account the widespread market offer of ethnic restaurants and cafés that consumers are increasingly facing today in their home countries, this literature gap is calling for a specific focus on this topic.

Within this context, the main aim of this paper is to investigate the influence of country image (CI) on consumers' willingness to patronize (INTP) an ethnic restaurant. Specifically, a model in which CI, consumer ethnocentrism (ETN), country familiarity (CF) and the dining core service offer (COFF) affect INTP is proposed and tested. The country image investigated regards France and the dining service evaluated is a French bistrot. To this aim, a quantitative survey was performed, administering a structured questionnaire to a sample (N = 300) of Italian consumers and applying Structural Equation Modeling (SEM).

This study contributes to the COO literature in a threefold way. First of all, this research investigates the COO effect in an understudied business sector, namely dining services, in this way contributing in overcoming the knowledge gap of the COO literature in this business context. Secondly, this study employs a multi-cue approach evaluating not only CI but also another fundamental cue on the bases of which consumers decide to patronize a dining service - that is: the core offer service – enabling a better and more complete insight of the phenomenon investigated. Last but not least, the analysis is performed furthering our understanding on cross-cultural management as the model includes ETN and CF.

The paper is organized as follows. After having described the conceptual model and stated the research hypotheses, the methodology used to reach our study goals is depicted. Results are then presented and discussed. Main conclusions together with some issues regarding study limitations and possible future research directions end the manuscript.

CONCEPTUAL MODEL AND RESEARCH HYPOTHESES

COO is traditionally conceived as a synthesis of stereotypes, skills, experiences and knowledge concerning a certain country and its manufacturing capabilities. Traditionally, it has been defined as “information pertaining to where a product is made” (Zhang, 1996, p. 51). In this sense, COO is an heuristic that can help consumers to make inference about product quality, affecting their beliefs about product attributes and intention to buy. In fact, many empirical studies have measured country image through product rather than country measures (Han, 1989). In the current study COO is conceptualized in terms of country image (CI). This is a broad definition relating to the stereotypes and generalized opinions that individuals possess about a specific country (Roth and Diamantopoulos, 2009). CI is measured employing indicators such as the industrialization level and technological development of a specific country and its political, cultural and economic situation (Pappu *et al.*, 2007). The image of a country as the origin of products is regarded as an extrinsic cue often used by consumers in the process of evaluation of the product quality and impacting on the intention to purchase products. This could happen also when a dining choice would have to be made. So, our first hypothesis is as follows:

H1: Country image positively influences the consumers' willingness to patronize an ethnic restaurant.

The COO cue, as brand and price cues, often acts as a risk-mitigating information about adverse consequences arising from a product purchase (Oberecker and Diamantopoulos, 2011) and it is particularly significant when consumers lack of knowledge/experience about the product. This effect is known as halo or summary effect (Han, 1989). According to the halo view, the uncertainty related to the characteristics of the products leads the customer with low knowledge of a country product category and with low familiarity with it, to use country image to infer an evaluation of its quality before purchase (Han, 1989; Laroche *et al.*, 2005). However, authors (e.g., Johansson, 1989) who support that the COO effect rises as the level of product familiarity increases, believe that individuals, having prior experiences with similar products from the same country and then with high level of product country familiarity, are not only able to evaluate product quality through intrinsic cues, but they are also capable to increase their ability to linking information concerned with extrinsic cues, such as COO, to product quality (Rao and Monroe, 1988). In the situation of high product familiarity, COO acts,

therefore, as a summary factor used as a proxy of the product attributes (Laroche *et al.*, 2005; Josiassen *et al.*, 2008).

H2: Country Familiarity positively influences the consumers' willingness to patronize an ethnic restaurant.

Country image cue can also be affected by some biases related to cultural orientation and national stereotypes of the consumer, such as ethnocentrism (Kaynak and Kara, 2002; Balabanis and Diamantopoulos, 2004; Ahmed and d'Astous, 2007; Chryssochoidis *et al.*, 2007; Chattalas *et al.*, 2008). The concept of consumer ethnocentrism explains the phenomenon of consumer preference for domestic products, or prejudice against foreign-made products (Sharma *et al.*, 1995). "From the perspective of ethnocentric consumers, purchasing imported products is wrong because, in their minds, it hurts the domestic economy, causes loss of jobs, and is plainly unpatriotic" (Shimp and Sharma, 1987, p. 280). According to this concept, consumers with high ethnocentric tendency prefer to buy national products because of appropriateness, morality and sense of loyalty to their home country (Shimp and Sharma, 1987; Watson and Wright, 2000; Kaynak and Kara, 2002; Wang and Chen, 2004; Hamin and Elliot, 2006; Bandyopadhyay *et al.*, 2011). On the contrary, consumers showing a low ethnocentric tendency evaluate foreign products on their qualities and on the basis of the utility they offer, rather than of their country of origin; and whenever this is considered, this condition is evaluated in a favorable manner when products are manufactured in a country with a positive image (Shimp and Sharma, 1987). Therefore, ethnocentrism supports the understanding of how consumers compare domestic with foreign-made products and how their judgments may be subject to biases (Kaynak and Kara, 2002; Balabanis and Diamantopoulos, 2004). Consequently, ETN can affect the intention to buy foreign products (Sharma *et al.*, 1995; Wang and Chen, 2004). Thus, our third hypothesis is as follows:

H3: Ethnocentrism negatively influences the consumers' willingness to patronize an ethnic restaurant

In this study we adopt a multi-cue approach as we investigate not only the CI cue but also the impact of the dining core service offer (COFF) on INTP. Traditionally, research in hospitality management identified three critical factors that restaurant guests consider when choosing where to dine: the food, the service, and the environment (Berry *et al.*, 2002; Sulek and Hensley, 2004). Weiss *et al.* (2004), investigating the attributes of the restaurant experience, demonstrated that restaurant food and atmosphere are the most important attributes relating to repeating intention. And, as fundamental benefits a customer receives, namely core benefits, are the essence of the dining choice of consumers, we would focus on the dining core service offer and prove its impact on INTP.

H4: The dining core service offer positively influences the consumers' willingness to patronize an ethnic restaurant

METHODOLOGY

The final version of the questionnaire was submitted to a convenience sample of 300 consumers in the city center of the town of Modena (Italy). Data were gathered within a period of two weeks on different days and at different times in order to reach the major variety of restaurant patronize habits.

In terms of socio-demographic features, the sample was composed as follows: 61.3% of the respondents were females, while 38.7% were males. In terms of age distribution, 47.3% were younger than 25 years of age, 35.0% were 26-35 years old and 14.7 were 36-50; just 3.0% of the respondents were older than 51. Family composition is as follows: 10.3% were single; 20.0% lives in pairs, 15.7% live in a family of 5 or more members and the remaining 54% live in a family of 3 or 4 components.

Measures Validity

Relevant reference literature was used to ensure the content validity of the measures. Interviewees were asked to evaluate the items investigated on a 7-point Likert scale anchored at 1 “strongly disagree” and 7 “strongly agree”, apart from the level of CF anchored at 1 “very low” and 7 “very high” as well as COFF anchored at 1 “not at all important” and 7 “very important”.

Table 1. *Measurement Scales and Items*

To examine the reliability and unidimensionality of each construct composing the proposed model, we use Cronbach's alpha and exploratory factor analysis. The psychometric analysis of the five construct scales show good internal consistency indexes. The Cronbach's alpha index for each scale is much greater than the threshold value of 0.70 (Nunnally and Bernstein, 1994) showing a good level of internal reliability ($\alpha_{INTP}=0.958$; $\alpha_{CI}=0.879$; $\alpha_{CF}=0.822$; $\alpha_{ETN}=0.798$; $\alpha_{COFF}=0.802$) (Table 2). All items exhibit a high item-total correlation, indicating their capability to measure the constructs investigated.

	Cronbach's alpha	INTP	CI	CF	ETN	COFF

Reliability		0.959	0.881	0.826	0.801	0.803

Note: *All factor loadings are significant at the $p < .01$ level.

Table 2. *Factor Analysis: Individual item factor loadings and reliability; AVE and CR*

Structural Equation Model (SEM) with the method of Maximum Likelihood was conducted to assess the validity of the hypotheses. Data was analyzed using Lisrel 8.80. To test the convergent validity we verify that all items were significantly ($p < .01$) and substantially (factor loading >0.604) loaded onto the expected latent constructs (Table 2).

Moreover, all constructs show good levels of average variance extracted (AVE) - larger than the suggested cutoff of 0.5 (Fornell and Larcker, 1981) - and composite reliability (CR) - greater than the recommended 0.7 cutoff (Hair *et al.*, 2011). Furthermore, to test the discriminant validity of constructs, we verify that the square root of every AVE value belonging to each latent construct was greater than any correlation among any pair of latent constructs (Table 3). We confirm that items correlate higher among them than they correlate with other items from other constructs.

	INTP	CI	CF	ETN	COFF
INTP	1.00				
CI	0.31	1.00			
CF	0.33	0.40	1.00

COFF	0.14	0.01	0.04	0.11	1.00

Table 3. *Coefficients Correlation Matrix*

Goodness of the Model

Table 4 points out that the overall fit of the conceptual model estimated is good. In fact, with the exception of the chi-square test, that is not significant probably because affected by the sample size, all the other alternative measures of fit show the good model fit: GFI=0.910; NNFI=0.967; CFI=0.972; IFI=0.972; RFI=0.928. Furthermore, RMSEA=0.0498 and the significance of its Close-Fit ($RMSEA < 0.05$) = 0.505 indicate an excellent model fitting (MacCallum *et al.*, 1996). The model has no substantial problems with residuals as shown by SRMR=0.0449 (Hu and Bentler, 1999).

CRITICAL N	300
CHI-SQUARE	$\chi^2 (179) = 311.548, p < .000$
χ^2 / DF	1.74
RMSEA	0.0498

NNFI	0.967
CFI	0.972
IFI	0.972
RFI	0.928
SRMR	0.0449
GFI	0.910

Table 4. *Goodness of the Model Fit Indexes*

RESULTS

Results indicate that CI, CF, ETN and COFF explain approximately 21% of consumers' intention to patronize the French bistrot. The role of CI in the INTP formation is positive and significant. Thus, we can confirm that individuals perceptions on the political and cultural system of a certain country (Laroche *et al.*, 2005) as well as their evaluations on its technological development (Knight and Calantone, 2000; Pappu *et al.*, 2007) have a positive effect on INTP. More positive the image that

consumers possess regarding a specific country, the greater their intention to patronize a restaurant offering the cuisine of that country, confirming our H1 ($\beta=0.188$, $p<.01$).

Consumers' knowledge and familiarity with the country of origin of the ethnic restaurant positively impacts on INTP. In particular, we found that the greater the overall knowledge of France and its culture, as well as the number of visits to France, the greater the consumers' intention to patronize a French bistrot, confirming our H2 ($\beta=0.209$, $p<.01$).

As expected, consumers with high ethnocentrism tend to prefer to dine in local restaurants/café's because of appropriateness, morality and sense of loyalty to their home country's products (Shimp and Sharma, 1987; Watson and Wright, 2000; Kaynak and Kara, 2002; Wang and Chen, 2004). Thus, results confirm the negative impact of ethnocentrism on the intention to patronize the French bistrot, confirming our H3 ($\beta=-0.234$, $p<.01$).

Finally, we found that there is a positive relation between consumers' evaluation of the core offer and their intention to patronize the French bistrot. In fact, the higher their evaluation on the menu variety, the use of local raw materials, the care in preparing and serving foods and drinks, rendering them original and attractive, the greater the intention to patronize the restaurant/café, confirming our H4 ($\beta=0.154$, $p<.02$).

Note: *All relations are significant at the $p<.01$ level.

** All relations are significant at the $p<.02$ level.

Figure 1. *Conceptual Model*

DISCUSSION

This paper is one of the first attempts to investigate the impact of COO on consumer intentions towards a service offer rather than products. This is done taking into consideration a specific business sector particularly interesting for the international marketing and the consumer behavior literature, namely the dining service business, as ethnic restaurants are widespread all over the world and tend to be ambassadors of the specific cuisine and culture of a certain country.

Findings evidence that COO can affect consumers' intentions even in an understudied context such as the dining service business and that this is consistent with the summary effect known in country-of-origin research (Josiassen *et al.*, 2008). In this way, the present research contributes to the extant COO literature overcoming the knowledge gap on this business context. Major COO statements and findings regarding physical products could then be extended also to the service context, with particular regard to the restaurants/cafés business. When studying the latter economic activities, scholars should also include CI and cross-cultural measurements as they result in specific attributes on the basis of which consumers tend to choose the restaurant in which to dine.

The general evaluation of the ability of the foreign country to perform the core offer has a positive impact on consumers' intention to patronize the ethnic restaurant. In our study, findings show that consumers' evaluation of the core offer of the service in terms of variety, use of raw materials and caring in preparing and serving food increase the intention to patronize the ethnic restaurant. Indeed, the greater the consumer evaluates the "country image" able to perform the service, the greater is his/her intention to patronize the ethnic restaurant.

Moreover, our findings give support to the negative role of ethnocentrism, confirming Wang and Chen (2004) and Hamin and Elliot (2006) results even when a service offer and not products are going to be evaluated by consumers.

Results would also have some managerial implications. Managers of this sector should emphasize the information on the country of origin of their businesses, as the effect exerted by a positive CI is stronger than that of the core offer. Indeed, this is a critical attribute to manage, potentially very useful in pursuing internationalization strategies aimed at replicating the dining formats in other countries. But at the same time they should also increase the level of knowledge on the restaurant country of origin as CF shows the highest positive impact on INTP, involving customers in thematic and cultural events to spread the French values and distinctive national traits. From this point of view, the role of public institutions could also be useful to increase the level of knowledge of a specific ethnic cuisine. National governments could support advertising and promotional campaigns in foreign countries referring to their cuisine as a CI sign and in so doing activating a virtue circle on the country image.

Ethnic restaurant managers should also be aware of the importance to segment the possible clientele on the basis of their ethnocentric tendencies, in order to address their marketing efforts to open-minded people, prone to meet other culture habits without feeling guilty if they would not patronize only the autochthonous offer.

LIMITATIONS AND FURTHER RESEARCH

Despite the possible theoretical and managerial interest coming from our study, some limitations could affect our contribution.

First of all, we focused on a cognitive definition of CI, while recent literature suggests to include the affective dimension of the COO construct too (Laroche *et al.*, 2005) intended as consumers' emotions to another country. Even if a cognitive conceptualization of the country of origin construct is predominant and widely accepted in the literature, including affective measures would result in a better and more complete understanding of the impact of CI on consumers' intentions (Maher and Carter, 2011). Accordingly, next studies should embrace both dimensions, cognitive and affective.

Secondly, this research was focused on a single ethnic dining offer, relative to a country image concerned with a developed country (France) as perceived by consumers of another developed country (Italy). Future researches should test the proposed model with regard to other ethnic offers, especially the ones coming from developing countries in order to compare both and check for potential differences. At the same time it could be interesting to repeat this analysis in other developed and developing countries in order to collect the country images and core offer perceptions of consumers of different nationality, as well as measuring for their level of individualism vs collectivism as this has been found to affect consumer intentions in COO literature (Gürhan-Canli and Maheswaran, 2000).

Furthermore, as product evaluations are affected not only by the image of the country they come from, but also by the perceived logical and consistent capacity of that country to manufacture/offer that specific product (Hamzaoui and Merunka, 2006), another construct that could be useful to include in further investigations could be the FIT construct.

Again, the literature on the dining experience evidenced different perceptions as this activity is performed alone or with relatives or friends (Johns and Pine, 2002). Thus, our model could be improved taking into consideration also the social dimension of eating out.

COMPETITIVENESS AND SUSTAINABILITY IN ALPINE DESTINATIONS. THE OPPORTUNITIES OPENED BY INTEGRATING AGRICULTURE AND TOURISM

Martini, Umberto; Buffa, Federica

Dept. of Economics and Management, University of Trento, Italy

ABSTRACT

The main current challenge for tourism destinations is to innovate and differentiate offer and products in order to meet the new segments interested in authentic holiday experiences. The integration of tourism and agriculture offers interesting opportunities, especially to traditional destinations needing to renew their offer. The paper underlines the importance of managerial and governance choices in multi-stakeholder contexts and sets them within the wider debate about management for destinations' sustainability and competitiveness. The main research question is whether or not this intersectorial integration can give Alpine destinations a sustainable competitive advantage. Using a supply-side analysis based on desk analysis, we examine the dairy and cheese-making sector in Alto Adige/Südtirol and, using a qualitative method, establish whether and how landscape, specific local resources and mountain products can be valorised by intersectorial integration. From a managerial point of view results show that the integration of agriculture and tourism works effectively when three enabling factors are present: 1) a coordinating territorial meta-management organization which is involved in the governance of the destination, and ensures consistency with the objectives of the government body; 2) public-private partnerships which stimulate top-down and bottom-up relationships, support entrepreneurial initiatives and contribute to the development of the local tourism offer; 3) the promotion of authentic local traditions, identity and culture. Positive effects are thus generated by intersectorial integration both in the destination development and in targeting the new tourism demand.

Keywords: *tourism, intersectorial integration, agriculture, destinations' sustainability and competitiveness, new demand segments, Alpine destinations*

INTRODUCTION

The issue of destination competitiveness has always been a focus of particular interest in the study of tourism management. Acquiring and retaining competitive advantage are essential to sustained long term development, both that of the enterprises involved in the tourist chain and of tourism destinations

as a whole (Kozak, 2002; Dwyer *et al.*, 2004; Hudson *et al.*, 2004; Kozak and Baloglu, 2011; Komppula, 2014; Benur and Bramwell, 2015). Since the 1990s these themes have gained ever greater importance within international academic debate, in relation to two specific topics above all.

The first is linked to the many factors – both internal and external – which have considerably increased the complexity of the competitive environment (take, for example, the spread of ICT, the emergence of new market segments and new models of consumption). Globalization and the influence of megatrends (Dwyer *et al.*, 2009; Mihalič and Gartner, 2012; McDonagh and Prothero, 2014 and 2015) mean that traditional tourism destinations have to overcome the maturity stage of their life cycle, making new strategic choices and redefining their offers (Alpine destinations are typical examples, see Mussner *et al.*, 1999; Pechlaner and Weiermair, 2000). From an academic point of view, destination management unites all these considerations and is, today, a firmly established, wide ranging branch of study concentrating on research into crucial subjects like the governance, management and marketing of tourism destinations (Laws, 1995; Leiper, 1995; Bieger, 1996; Keller, 1998a; Manente and Cerato, 2000; Pechlaner *et al.*, 2003; Beritelli *et al.*, 2007; Wang and Pizam, 2011; Laesser and Beritelli, 2013) (see also the Special Issue of *Tourism Review* 63/2, 2008 and 65/4, 2010).

The second topic is linked to strategies of sustainable tourist development. Ritchie and Crouch (2000 and 2003) were the real drivers of a conviction that competitiveness and sustainability are inseparable: “competitiveness is illusory without sustainability” (Ritchie and Crouch, 2000, p. 2). And so - on the one hand - the valorisation of territorial resources and the integration of the product bundle become essential to destination competitiveness. And on the other, the adoption of a sustainability orientated strategic-managerial approach creates value for the territory and for the actors therein, combining the goals of profit and economic growth with those of valorising the area’s environmental heritage and its community (Inskeep, 1997; Swarbrooke, 1999).

Tourist destination competitiveness from a sustainable perspective thus remains a particularly topical theme (Chen *et al.*, 2011; Franch and Martini, 2013; Goffi and Cucculelli, 2014; Esparon *et al.*, 2015). Today’s challenge for destinations is to make strategic choices which allow them to innovate and differentiate their offer in order to respond to the new demand segments interested in experimentation and having authentic holiday experiences (Chhabra, 2005; Sedmak and Mihalič, 2008; Volo, 2009; Sims, 2009; Sidali *et al.*, 2013; Engeset and Elvekrok, 2015). The differentiation and innovation of the offer result from the integration of actors working in the tourism chain and from a capacity to systematize the competences of individual enterprises, combining collaborative and competitive relationships (Williams *et al.*, 1998; Beritelli and Laesser, 2013; Zehrer *et al.*, 2014). The coordination and management of the territorial stakeholders’ plurality of interests and objectives thus become crucial both for the

organizations involved in meta-management and for the actors involved in the governance of the destination. Responding to current market demand requires that destinations identify their specific local attractions; valorise authenticity and define tourist products and offers which allow tourists to understand and appreciate the unique character of the territory. Many destinations have focused their offer on the rediscovery of their territory's historical and socio-cultural heritage and its traditional local products. A growing interest in events and shows which allow tourists to experience local traditions, customs and dress, and the increasing popularity of wine and food tourism, are good examples of how destinations are aiming to respond to new holiday behaviours. Within this context the integration of the tourism and agriculture sectors seems to offer particularly interesting new opportunities. From a managerial perspective it is interesting to observe whether virtuous circles develop between the two sectors: does the valorisation of typical agricultural products help to strengthen the identity of the territory and promote the destination's tourism offer? Does the presence of market segments interested in the authenticity of their holiday and in discovering local specialities help to support the agricultural sector (*e.g.* through the buying of local products, visits to producers and/or farmers) and to incentivize connections between the enterprises involved in the tourist chain (*e.g.* local restaurants/hotels using local produce)? The aim of this study is to show that new development opportunities arise from the intersectorial integration of agriculture and tourism. Such integration is very challenging for Alpine territories: it is already possible to find innovative products and tourism offers which imaginatively and constructively meet this emerging demand.

In the light of the above observations, the main research question driving this study is whether or not the integration of agriculture and tourism can give Alpine destinations a sustainable competitive advantage. Using a supply-side analysis based on desk analysis, we examine the dairy and cheese-making sector in Alto Adige/Südtirol (henceforth Alto Adige) and, using a qualitative method, establish whether and how landscape, specific local resources and mountain products can be valorised by intersectorial integration. The choice of Alto Adige as the location of our investigation into intersectorial relationships between agriculture and tourism was based on two factors in particular. The first is linked to the importance which these sectors have for the socio-economic development of the territory, the second to the presence of an established network of territorial organizations which are involved in the management of the enterprises and actors in the two sectors and therefore define the strategies in support of sectorial integration.

This analysis points up managerial and governance choices in multi-stakeholder contexts which sit within the wider debate about management for destinations' sustainability and competitiveness. Our thesis is that agriculture and tourism can be realistically and appropriately integrated in territories

where 1) there is a territorial meta-management structure/organization which is involved in the governance of the destination, ensuring direction and coordination coherent with the objectives of the government body; 2) public-private partnerships (PPP) support and incentivize entrepreneurial initiatives consistent with the development of the local tourism offer; 3) the valorisation of the socio-cultural dimension is based on authentic local traditions, identity and culture. If all these factors are in place and well managed, sectorial integration becomes an effective choice for destinations seeking to win and retain a competitive advantage.

AGRICULTURE AND TOURISM: WHAT ARE THE OPPORTUNITIES FOR ALPINE DESTINATIONS?

The opportunities offered by integration between agriculture and tourism were already being considered in the 1980s by international organizations (i.e. UNECE - United Nations Economic Commission for Europe, FAO – Food and Agriculture Organization of the United Nations) and by the scientific community (Dernoi, 1983). Until the end of the 90s, however, the opportunities offered by intersectorial choices were underresearched, or limited to particular territories (Telfer and Wall, 1996). However, awareness of the subject has noticeably increased in recent years, fuelled by obvious consumer interest in traditional/typical local foods (Sims, 2009; Engeset and Elvekrok, 2015; Organ *et al.*, 2015). Torres and Momsen (2011) examine the connections between agriculture and tourism, emphasizing the possible opportunities presented – for both developing and developed countries. If the former can benefit from sectorial integration by reducing poverty and improving living conditions, the latter (as has been done in the US, Japan and Europe) can use it to differentiate tourist offers and strengthen territorial identities.

Against these advantages, however, must be set one of the main issues regarding the integration of tourism and agriculture, that of resource competition. The question is whether intersectorial connections create value for the territory or whether, on the contrary, they make a trade-off inevitable, in that the resources, labour and investment that go into the tourism sector are thereby removed from the agricultural sector (Latimer, 1985; Telfer and Wall, 1996; Torres and Momsen, 2011). This wide-ranging debate is still ongoing, as academics continue to differ in their observations and conclusions (Fox and Cox, 1992; Telfer and Wall, 1996; Fleischer and Tchetchik, 2005; Hernández Hernández *et al.*, 2010).

The possible opportunities presented by the integration of agriculture and tourism are of particular interest for Alpine territorial development since the debate about the use and protection of natural resources has always been a key topic, for both International organizations (i.e. International

Commission for the Protection of the Alps - CIPRA) and for the academic community (see, for example, the contributions to the *Forum Alpinum 2014* dedicated to “Alpine Resources” www.forumalpinum.org). The importance of the agricultural sector in the Alps is not limited simply to its role within the economy (for an historical analysis of the development of agriculture and the economy in the Alps see Bätzing, 2005); it actually extends to the role it has to define the beauty of the landscape (Shirpke *et al.*, 2013) and to the multifunctional services which mountain agriculture can perform. As shown in Ruffini *et al.*, 2011 (p. 91) “structural changes in agriculture pose a social problem, as demonstrated by the intensive debate on agriculture among politicians and the public alike. Indeed structural changes in agriculture influence not only the physical aspects of landscape, but also the vitality of rural areas and ultimately the quality of agricultural products.” Probably the most urgent questions faced in the development of Alpine areas are the depopulation of the more marginal zones (see also Vogl and Vogl-Lukasser, 2014) - leading to the inevitable abandonment of farms (Bartaletti, 2004; Ruffini *et al.*, 2011) - and the decrease in unspoilt landscapes and genuine, traditional cultural practices (www.cipra.org). CIPRA notes, however, that in areas where tourism is the main source of income fewer people are migrating from the mountains. They also emphasize that the future of mountain agriculture depends to farm businesses’ ability to maintain their traditional cultivation and production methods and, in so doing, to attract those market segments by whom the quality of a product and the care and skill with which it is made are highly valued (www.cipra.org). Considering the individual nature of farm businesses, CIPRA considers, moreover, that mass production is not only hard to achieve but also economically uncompetitive (Ruffini *et al.*, 2011).

The problems faced by mountain agriculture and the consequent effects on the general socio-economic development of these areas have also been examined by the EU in the *Alpine Space Programme* (ASP). In the last ASP (2007-2013) the focus on the agricultural sector was particularly related to the impact of climate change on the Alpine area (e.g. the *ClimAlpTour* and *Silmas* projects) and on changes to the territory’s social structure (e.g. the *Demochange* project). In some cases the possibility of creating value for the territory through the integration of agriculture and tourism has been realised. An example of this is the *Demochange* project, which ran a pilot project called “Model Region Langa Astigiana”, involving collaboration between farmers and stakeholders in the tourism sector aimed at promoting typical products as part of the region’s tourist offer (www.alpine-space.eu/projects/projects/detail/DEMOCHANGE/show/). Given the results gathered over the seven year period up to 2013, the ASP 2014-2020 very clearly states the need to support the development of the Alpine area through - among other approaches - the integration of agriculture and tourism.

Such accounts strengthen the hypothesis that intersectorial integration in the Alpine area can be a development opportunity which benefits both local businesses and the local community. Further support is found for this account in the experiences of some Alpine territories which have already introduced new tourist products. Cheeses, and dairy products in general, are a good example of this: Bregenzerwald (Austria) with its “Käsestrasse” (cheese route) (www.kaesestrasse.at); Switzerland, with its Milk and Cheese Paths and The Swiss Chocolate and Cheese Trail (www.myswitzerland.com), the Haute Savoie with the typical cheese and potatoes based recipes (www.chamonix.net).

The DOP (protected nomination of origin) and IGP (protected geographical indication) labels, which certify the area of origin and the specifically local character of a product, have also benefited the local agricultural and food and wine products that integration between agriculture and tourism promotes. The Slovenian cheeses *bovški sir*, *tolminc* and *nanoški sir*, which have been awarded DOP labels, are examples of this (www.slovenia.info), as are some Italian Alpine cheeses, like “Bitto della Valtellina” (Lombardia) (www.valtellina.it/eng), “Fontina della Valle d’Aosta” (www.lovevda.it/en/) and “Spresa delle Giudicarie” (Trentino) (www.visittrentino.it/en).

In the light of the examples which have emerged in some Alpine territories and the strategic choices these territories have made around intersectorial integration as a development tool, the next sections of the paper describe the experience of the Alto Adige destination. The dairy and cheese making sector is used to illustrate some initiatives put in place to encourage the integration of agriculture and tourism and the managerial and governance decisions in which stakeholders from the two sectors have consequently been involved.

THE INTEGRATION OF AGRICULTURE AND TOURISM IN ALPINE DESTINATIONS: THE CASE OF ALTO ADIGE/SÜDTIROL

Main research results

The role of mountain agriculture in Alto Adige is critically important. Alongside its significance in the development of the local economy in its pre- and post-industrial phases (see Bartaletti, 2004; Bätzing, 2005), the current importance of this sector for the socio-economic development of Alto Adige is clearly revealed by the data from the last general agriculture census (Astat, 2011 and 2014), and, indeed, by the focus - since the 1970s - on the certification of agricultural produce and foods from the territory (Provincial Law of the Autonomous Province of Bolzano, n. 44/1976).

A testament to its strategic importance is the fact that agriculture is the sector of the local economy which has been least affected by the financial and economic crisis (IRE, 2014). In 2010 (most recent data

available) there were more than 20,000 farm businesses in Alto Adige, most of which were family run (Astat, 2014). About 5% of the population works in the agricultural sector, 1.1% more than in Italy as a whole, or than in other Alpine areas (Provincia Autonoma di Bolzano, 2014). Some of the families running these businesses earn their entire income from them; for others - more than half, in fact - the farm enterprise provides a supplementary income. Farmers are choosing more and more frequently to combine their original occupation with activities closely linked to the agricultural sector. Since 2000 a growing trend towards agritourism has been observed, allowing additional family members to become involved, and, indeed, find their main employment within, such enterprises (Astat, 2011). Agritourism combines perfectly with the specialist production of most farmers in Alto Adige: about 27% of them are dairy farmers and about 26% fruit growers (Astat, 2014).

The enterprises involved in the dairy/cheese-making sector are represented at local level by the “Federazione Latterie Alto Adige” (Sennereiverband Südtirol) (FLAA). Founded in 1941, its members are local dairies and cheese-making enterprises for whom it provides consultancy services and assistance in ensuring the quality of farmers’ milk and standards of production and transformation. The local institutions and territorial bodies recognize that the 5,000 plus dairy farmers in Alto Adige do more than just produce milk and cheese – they are also instrumental in maintaining the high Alpine settlements, farms and pastures and thus in tending and protecting the landscape (www.suedtirolermilch.com/en/dairy-association/).

Since the end of the 1970s the promotion and marketing of milk and dairy products has benefited from the quality assurance label “Qualità Alto Adige”, established by provincial law. This label guarantees the quality and origin of agricultural produce and has been extended over the years to cover more than ten food product groups (www.suedtirol.info/it/News-e-info/Prodotti-tipici-altoatesini.html).

Territorial organizations – both public bodies and tourism organizations – are key to the valorisation and promotion of a local tourism offer through which the area’s identity can be expressed and its traditional products marketed. Since 2000 this objective has found form in the destination management organization (DMO) “Alto Adige Marketing”, which replaced the previous tourist board, thus completing the process of privatizing tourist associations which had begun ten years earlier. Alto Adige was among the first destinations in the Alpine Arc to initiate this process. Its strategic aim is to increase the operational and managerial flexibility of the organizations involved and to incentivize the building of relationships between local enterprises in order to define and promote a destination offer which revolves around intersectorial integration.

The reorganization of the tourism sector in Alto Adige and the growing concentration on the part of territorial bodies on destination marketing has led to the reform of these regulations and the creation of the “marchio ombrello Alto Adige” (*umbrella label*) which guarantees the location and/or provenience of the products and services generated by local tourism and industry. Established in 2004, the aim of the umbrella label is to exploit the potential of sectorial integration in order to strengthen the competitiveness of Alto Adige as a tourist destination and as a region known for the production of high quality goods and services. The umbrella label allows each product to be marketed under a common brand without having to give up its own identity (www.provincia.bz.it/marchioombrello/marchio-ombrello.asp). It developed out of an awareness raising program initiated by territorial organizations and aimed at all sectors of the local economy. Following this reasoning, the brand guarantees the quality of the product and the rigor and care with which it is processed and produced (*e.g.* as attested by the amount of international recognition dairy-products have received www.suedtirolermilch.com/en/current/press), its provenance and authenticity and hence promotes traditional local products and strengthens territorial identity. An analysis of the FLAA’s own initiatives, and of those organized in collaboration with the territory’s tourist associations/organizations, provides useful examples of the integration between the agricultural and tourism sectors.

The FLAA has targeted many of its initiatives at the local community, one of the most important of these has been a project for primary schools, in which the provincial Chamber of Commerce also participates.

Among the most significant activities upon which the FLAA collaborates with local tourism organizations are a wide range of events and initiatives aimed at tourists. The “Festa del Latte” (Milk Festival) is of particular importance; it takes place every two years, in a location chosen for its typically Alpine setting, with the traditional summer pastures and mountain farmsteads (*alms*). The agricultural and tourism sectors, as well as being represented by sectorial associations and by local public bodies, are also directly participated in by associations of breeders, of artisans, of the catering and accommodation sector, as well as by hotel schools, voluntary associations and local folk groups. There are cheese tastings, tastings of other local specialities, hiking or walking itineraries, creativity workshops designed to allow adults and/or children to experience and learn how to make cheese and other dairy products, and to appreciate their specialness.

Discussion of results

This analysis of the dairy/cheese-making sector in Alto Adige highlights the strategic importance of the agricultural sector for the economic and social development of the territory and the care with which political institutions, businesses and the local community have always supported farming and local products. The establishment of the umbrella label, and that of the other labels certifying the quality and origin of local products were important steps along a shared development path. As anticipated two initiatives emerge as paramount: education of primary school pupils and territorial promotion.

Investing on primary school oriented initiatives addresses a key target, as they are consumers of dairy products as well as being the next generation who may go on to work in dairy production, or in other agricultural enterprises and/or sectors. The project investigated focuses particularly on raising the children's consumer awareness in terms of local products and teaching them about the importance of agriculture for the continued existence of local farming businesses and the mountain pastures, thus attempting to discourage them from leaving their mountain territory.

The Milk Festival is also an opportunity for Alto Adige not only to promote its dairy products, but also, very importantly, to valorise its local peasant traditions, customs and costumes.

In Alto Adige, where authenticity is rooted in distinctive aspects of the territory, the integration of agriculture and tourism has become a real opportunity to differentiate the territory's offer and increase its competitive advantage. Although sectorial integration is a strategy open to many Alpine destinations, Alto Adige can differentiate its particular offer because the territory's authenticity reflects the values which truly define its identity.

The above account reveals the extent to which mountain agriculture has acquired a key role in the definition of Alto Adige's territorial identity and in the promotion of a tourist offer which can express authentic values and support traditional local products. This case study on the relationship between agriculture and tourism in Alto Adige is particularly important since it enables the detailed examination of these themes and identifies possible best practice which could be extended to intersectorial development in other territories.

CONCLUSIONS

Our research reveals further examples of integration with the tourism sector which help to differentiate the offer by focusing on and enhancing its unique identity. This study rests on the thesis that the integration of agriculture and tourism works when there are 1) synergies between organs of government and those of governance, 2) public-private partnerships (PPP) and 3) the valorisation of the unique, authentic socio-cultural identity of the territory. An analysis of the case study bears out this theory. Although the research was confined to a single destination, the relevance of the analysed case study allows us to reply in the affirmative to the research question which begins the investigation. The

integration between agriculture and tourism is shown to be a valid approach to strengthen the competitive advantage of Alpine destinations, while making choices consistent with sustainable tourist development in the territory. In order to ensure that this competitive advantage can be maintained over time, however, all the main stakeholders involved in the economic and social development of the area must share similar objectives and collaborate in its planning. From a strategic-managerial perspective, in fact, we see that:

- 1) The reorganization of the tourism sector has created the conditions in which consortia and associations can be formed and then develop their own particular offers, consistent with the DMO's guidelines; the latter, in turn, operates in conformity with the development plan produced by the organ of government. The shared objective of incentivizing sectorial integration is one of the territory's strong points since it facilitates coordination in multi-stakeholder contexts and supports the enterprises of the actors directly involved in the governance of the destination.
- 2) The integration between the agriculture and tourism sectors encourages PPPs by creating an environment in which local business people/entrepreneurs find backing when realising products and projects coherent with the territory's overall development. Given the diversity of all the little businesses operating in farming and tourism, many of the initiatives would never take off if they were embarked upon by single enterprises alone. Sectorial integration is thus a strategic choice which nurtures top-down and bottom-up relationships between public and private actors, and gives individual businesses the opportunity to create value - not just for themselves, but also for the whole territory.
- 3) The valorisation of the resources, traditions and values of the local community and its territory strengthen its identity and emphasize its authenticity; the latter then becomes a key element for the systematic promotion of the territory's agricultural and food products and tourist offer more generally.

This paper emphasizes the positive effects generated by sectorial integration, both for the development and preservation of mountain agriculture and for the definition of a territorial tourism offer aimed at demand segments who value the authentic and experiential dimensions of their holiday. The development of intersectorial synergies can help to reduce some of the problems affecting Alpine destinations, like depopulation and the abandoning of farms. Furthermore, the conservation of high mountain pastures means that soils are not impoverished and hydrological risks due to landslides and/or soil movement are decreased. From the point of view of the tourism offer, the territory's landscape and natural resources are undoubtedly a powerful pull factor for new market segments. The valorisation of typical products and experimenting with new products and tourist offers which

enhance/highlight the territorial identity are strategies which can turn a holiday into an “authentic experience”. Mountain agriculture products typify the specialness of local food and become a distinctive part of the territory, helping to differentiate the offer and to avoid the homogenisation that globalization so often dictates (Mark et al., 2012).

THE STRATEGIC PLANNING AND THE ROLE OF THE SOCIAL CAPITAL

Martini, Elvira; Serluca, Maria Carmela

Department of Law, Economics, Management and Quantitative Methods, University of Sannio,
Benevento, Italy

ABSTRACT

Strategic planning includes all activities by which we define the mission of the institution, we define the general objectives and develop policies that will optimize resources efficiently to effectively achieve the objectives in order to meet the needs and expectations of citizens (Meola and Antonelli, 2006: 18). In the process of identification of strategies is crucial involvement and listening to stakeholders, primarily the community, through mechanisms of active participation. Civic participation in the construction process of the strategic plan is, therefore, a challenge and the condition for the success of the plan.

The reference to civic participation draws attention to the concept of social capital, defined as assets of attitudes and beliefs shared by a given community or, as claimed by Putnam (1993), a facilitator of collective action, identifying in civiness (civic culture) one of the main factors that affect the performance of the institutions. The aim of this work is the analysis of the relationship between the strategic planning activities of a territory and the provision of all aspects of social life (trust, norms and social networks) that, by allowing individuals to act together, increase the efficiency of the company. In this way, therefore, the share capital is a variable that can promote the efficiency of the administrative institutions, facilitating the assimilation of identity and individual interests to those of the community.

Keywords: *Strategic planning, public administration, social capital, civiness*

THE ROLE OF STRATEGIC PLANNING

The strategic plan is one of the most innovative instruments of territorial governance, experienced in recent years by the most dynamic cities in Europe and in Italy. It has accompanied profound economic, social and environmental issues, implementing participatory and inclusive processes of all forces on the territory and therefore setting a powerful incubator of policies and shared development strategies.

In local government, through the strategic planning process, the administration must identify the route to follow throughout its mandate, assessing threats and opportunities in order to define their long-term goals; such decisions will be crucial to produce actions that orient and guide what an administration is, what it does and why it does (Bryson, 1995).

A clear and complete definition comes just from Bryson, according to which the strategic planning "Clearly is a leadership and management innovation That Is Likely to persist Because, unlike many other recent innovations, it Accepts and builds on the nature of political decision making. Raising and resolving important issues is the heart of political decision making, and the heart of strategic planning. Strategic planning seeks to Improve on raw political decision making, However, by helping To ensure that issues are raised and resolved in ways That benefits the organization, ITS key stakeholders, and society" (Bryson, 2011: 40).

It is obvious that the realization of this process can not be separated from "processes of participation, discussion, listening; a pact between directors, actors, citizens and other partners to achieve that vision (shared about of a given territory's future) through a strategy and a series of subsequent projects, variously interconnected, justified, assessed and shared "(Camagni, 2003: 83).

With the introduction of the strategic planning process, the local authority can achieve significant benefits (Mazzara, 2009: 12-13), including:

- the systematic evaluation of the environment in which it operates;
- identification of the critical factors and trends characterizing its way of functioning of the institution and to develop their roles;
- the achievement mandate's objectives and, consequently, their respective missions;
- the identification of strategic instances that need to embrace;
- the definition of how to achieve these instances, through the analysis and review of the mandate and objectives of the mission, service levels, and its costs and financing, management or organization.

The characteristic elements of the strategic planning process can be identified in leadership, partnership and participation (Presidency of the Council of Ministers, 2006: 19-21):

a) leadership on the part of local politicians, based on:

- political legitimacy from the people and the system of actors;

- strong transparency and accountability in decision making;
- the tension to build truly shared visions and consensual;
- the search for ways to give voice to the interests unorganized and weaker;
- recognition of partnership that not only to start, but also to maintain;

b) partnership, negotiating and public-private agreements, which have become the rule for new models of governance. The conditions to contribute to the effective improvement are:

- the presence of mutual respect and mutual trust;
- the presence of a sufficient capacity for the management and trading;
- the careful choice of partners;
- the formulation of ex ante few clear rules of the game, not subject to negotiation;
- the transparent distribution of tasks and responsibilities between partners and clarity in the distribution of benefits between public and private;
- accountability on the part of public leadership;
- the public administration has to maintain a strong power of projects' evaluation ex ante of projects and monitoring and ex post of their realization.

c) citizen participation in the decision-making process, which is, at the same time, a challenge, a goal and a condition of success.

Seen in this light, therefore, strategic planning is a “process of deliberative democracy. It joins the representative institutions elected through a wider involvement of collective actors, public and private, in fundamental decisions on the future of the city” (Perulli, 2007: 33).

It is necessary then the involvement of citizens' organizations and their interests, as weak or strong they may be. Key player in the whole process is the public body; the important role assigned to it comes from the fact that it is the only actor “to have the necessary authority, or rather the position and legitimacy, to influence the initial decision of other stakeholders to work together with the strategic project” (Cavenago, 2004: 189). For this reason, it takes in the process, in its different phases, different roles: not only the manufacturer of the plane, but promoter, facilitator, coordinator, evaluator of compatibility and scorer (Camagni, 2003). The value of strategic planning is the process and not just the final product. The preparation of a strategic plan, outside of any prescriptive nature, it is possible

only if they can rely on an efficient organization and recognition of the authority of the institution that has initiated the preparation of the plan (Martinelli, 2003 : 40).

The whole process starts from the precise definition of clear objectives, easily understood outside, specific compared to the expected result, realistic in relation to the resources available, limited in time, graduated according to priorities.

But to be able to attribute the status of the strategic objective, it must meet the following requirements and answer these questions: *“Characterizing*: is the goal relevant, does it mark and represent the contents of the program to which it belongs? *Governable*: is the administration able to decide on the content of the objective independently of other stakeholders? *Critic*: can the failure in achieving the objective determine a substantial adverse impact on the perception of the institution towards the citizens and stakeholders? *Challenger*: can the realization of the objective be translated in terms of performance and great impact? *Measurable*: is the objective measured by objective indicators that make the different results over time?” (Goretti and Meacci, 2013: 407-408).

This activity definition of decisions which are of strategic significance is, and must be preceded by a moment of analysis of the context in which the institution is located, namely an evolutionary analysis of the needs of the area in terms of potential demand and real, the identification of the possible scenarios to follow and explication of the strategy in intervention programs arranged in a defined sequence of priorities in relation to trends and expectations of citizens, but in connection with the superstructure to which it belongs: the European Community, State Region and Province.

In such a process of identification of strategies is crucial involving and listening to stakeholders, primarily citizens through active participation.

The active participation of citizens in the construction process of the strategic plan is a challenge and the condition for the success of the plan itself. This involvement enhances and strengthens elective democracies with extensive involvement in the decision-making system. The task of the local authority will provide “not only all logistical and technical support operating so there are opportunities for comparison, but also verification and synthesis tools” (Meola and Antonelli, 2006: 24).

The stakeholders involved in the process can develop mutual trust, understanding, ability to work together and improve their attitude to dialogue and cooperation.

But the process to be successful needs “a strong insurance policy that the result of joint work will be taken into account, that the decision-making system is ready to receive advice and guidance from the

project groups and discussion. The risk is to produce a simple communication, not less important than the previous one, but it could lose its main competitive advantage: the ability to create dialogue between the actors on strategic issues and to draw signs for the future, taking into account the different opinions and needs" (Rosso, 2005: 79-80). It is a constantly evolving process, which does not end in the preparation of a unchangeable document or in a number of projects, but it is an instrument subject to constant checks and revisions, to support the implementation of cost-effective solutions for the majority of citizens (Meola and Antonelli, 2006). Regardless of the structure, the content, the method of construction of the plan, the aim is always to "support the process of social development and revitalization of the local economy through the expansion of networks of collaboration among stakeholders, promoting forms of public-private partnership and the involvement of citizens" (Lecci, 2011: 14). The common goal is to help local actors to find ways to grow and mobilize toward common goals of development, redefining of the city's identity, identification of processes for the conversion of the social and economic structure of a whole (including through partnerships), strengthening of existing networks between different actors, the identification of projects and actions possible with public funds, national and community, but also with additional resources such as private funds.

THE SOCIAL CAPITAL AS CIVIC PARTICIPATION

The reference to civic participation, as mentioned in the previous paragraph, draws attention to the concept of social capital, defined as assets of attitudes and beliefs shared by a given community or, as claimed by Putnam (1993), "the trust, the rules which regulate it, the networks of civic engagement, elements that can improve the efficiency of social organization promoting initiatives taken by mutual agreement" (1993: 196), allowing individuals to act collectively, through a better coordination of individual actions and helping to contain forms of opportunism and free rider.

According to the author, the social capital is a facilitator of collective action and it locates in *civicness* (civic culture) as one of the main factors that affect the institutions' performance.

In his analysis, Putnam relates the institutional performance of the regions with the endowment of social capital, understood as *civicness*. In this perspective, the social capital consists, in fact, of those aspects of social life - networks, norms and trust - that, by allowing individuals to act together more effectively to achieve shared goals, increase the efficiency of the company. In this way, therefore, the share capital is to be a variable that can promote the political and economic development of a social system, as it facilitates the assimilation of identity and individual interests to those of the community to which they belong (Vespasiano and Martini, 2008: 28).

By taking into account these considerations, It is our intention to show that the efficiency of the administrative institutions grows with the increasing levels of social participation, arguing that democracy of a government can be strengthened by comparison with a vigorous civic community, woven from relationships of trust extended by rules of generalized reciprocity and networks of civic engagement. The great significance of these findings has facilitated the interest of many scholars who have reaffirmed the complementarity of the state and civil society, for the dissemination of social norms of trust and reciprocity. Many parts, in fact, have proved the existence of a strong relationship between the endowments of social capital, measured as the level of building confidence, and the extension of political rights and civil liberties in a particular country. In the light of these considerations, strategic planning appears to be a new method, a new form of urban governance (or good governance) in which can be placed diverse contents and objectives, which are the result of an interaction and a collective reflection.

To avoid falling into naive simplification it is necessary to emphasize that there could be limits in this planning process based on the relatedness between the parties: often it is more inclined to cooperate with known or sufficiently similar people, or that possess a good reputation based on their past.

In these cases, it is essential to build a trusty networks starting from political guarantees. It becomes essential that external and local government share the same interests, and that the local one is engaging, with long-term strategies, the same associations (cultural, productive, recreational) in the mechanisms of governance. As a result, a further step in building confidence is the development of a series of autopoiesis mechanisms, which ensure the stability and longevity of these attempts on cooperative and, where necessary, including the self-reproduction and the redefinition of the same (Martini and Serluca, 2012: 269).

A POSSIBLE APPROACH TO PARTICIPATED PROCESS OF THE STRATEGIC PLAN CONSTRUCTION

The process to be implemented can not be improvised by following the current fashion or relying on expert / external consultants. On the contrary, this process requires the development of an adequate culture in order to realize the document itself and to manage the application. In a bottom-up development and integrated local programming perspective, the ability and willingness to constantly monitor concrete actions represent the premise so that everyone has a validity within the administration of the institution. The participation of social actors does not occur naturally. It is driven by different motivations such as the idea of being able to access the benefits of an economic nature, the

commonality of interests and values (Cangelli, 2012). The strategic plan will be accompanied by politics and public administration. In fact, it risks of remaining on paper if there is not the necessary conviction to make use of it. Only in this way the strategic planning can be a tool able to help place the City in a more technical managerial and modern dimension, in which the administrative action is better targeted, more verifiable and, as such, more effective than it is now.

It follows that the methodology should be based on the broader stakeholder engagement, "the different local actors (public / private, institutional / non-institutional, formal / non-formal) can provide carriers of resources, knowledge, intelligence that are useful to interpret the complexity and nature of the needs, to improve the effectiveness of decision-making, to foster an interactive exchange that sediments awareness on the need for new scenarios to be pursued "(Gastaldi, 2003).

This will develop elements of social capital through interaction and participation, the growth of mutual trust and shared values and goals, synergy and cooperation *ex ante* between different economic entities in the implementation of projects (Camagni, 2003: 98).

This path can be powered, for example, by:

- meetings with the institutions in that area (chamber of commerce, professional associations, banks, cultural associations, Union of Industrial investee public Enterprises, ASL and health authorities, Superintendence, neighboring municipalities, provincial administration, Territorial Office of the Government, trade unions, ...). They must be invited by the person responsible for the process (Mayor, Councillor ...) not only to present the process, the main guidelines, but mainly to listen to the needs, concerns and priorities that participants exhibit, as well as suggestions and proposals for orienting the administration's decision;
- open events and public forum to collect instances of specific issues;
- working groups on specific strategic issues.

At all stages of the process it is necessary to give a chance to everyone in order to let them express their opinion and participate in the debate. In other words it means to pay special attention to the issue of communication. The communication must be conceived as a real process that fits into all actions, projects, services entity (Alessandrini, 2006). The overall objective is to ensure "openness, visibility and transparency of all activities carried out by a circuit of information spread, effectively and efficiently to the parties concerned able to ensure and encourage their participation and involvement in the process" (Lecci, 2011: 120-121). The Public administration needs to communicate with citizens and one of the ways to achieve this goal is the use of new communication technologies

(Information and Communication Technology - ICT) through a multi-channel approach, using a variety of tools in a coordinated manner with each other (web pages, social networks, logo, wineskin the traditional activity of dissemination of news in the press and local TV stations, as well as traditional forms of meeting such as seminars, meetings, conferences), so as to be effective with respect to the number of individuals covered , the information provided and the feedback obtained (Secondini, 2014).

However, ICT should not replace, but rather to support, strengthen, extend and innovate the scope and manner of participation activated through traditional channels and locations; its use can make distant subjects closer to the institutions. To do this is required an effort on the part of political actors to a conscious use of such instruments. "Being citizens in the information society does not only mean to access the services of a more efficient PAL, able to draw their own services on the needs of users (e-government), but also to participate in a new way in the life of political institutions (e-democracy), taking into account the ongoing transformation in the relationship between public and private actors" (Department of Public Service for the efficiency of government departments, 2004: 12).

It is essential the creation of a web page on the corporate website of the institution, as a showcase of the whole process on, where to put all the activities, products and publicize the results promptly to the initiatives to be undertaken. It may be divided into several sections:

- actors of reference;
- towards the strategic plan;
- primary sources;
- time schedule;
- study group;
- channel power level (institutional meetings, public meetings, open events and forums citizens, etc...);
- memoranda of understanding;
- press clippings;
- video presentation.

Creating also a page within the popular social network is an effective communication channel. It is essential if the goal is to reach a large number of people quickly, greatly expanding the opportunities for comparison. Ultimately, then, as happened to many Italian administrations, the critical condition to oversee the success of the strategic plan can be summarized as follows (Presidency of the Council of Ministers, 2006: 157):

- a strong and committed political leadership, able to consistently reproduce the legitimacy of the entire process;
- a constant and targeted communicative investment, because without adequate visibility process, the widespread perception may not exist or at least lose legitimacy;
- oversight of relational dynamics, rather than the content of the plan, which is accomplished essentially as active form of reproduction of capital. It is, therefore, necessary to pay close attention to the conditions of the context and the continuous maintenance of fiduciary bonds through which passes the perception that a community has of itself and its objectives;
- avoiding spending too much time in building a mechanism theoretically perfect, which really does not intercept the expectations, conveniences, the guidelines of the actual system of actors.

CONCLUSIVE REMARKS

The strategic planning for the development of the territories is one of the issues on which the local public administrations have placed more attention in recent years. The principal idea is that it is crucial to read their own territory at the local level, to select the priorities sustainable and drive around these priorities the public and private resources. Local institutions of each nature and political orientation are primarily responsible for the development of a territory, for the power they direct the development choices, their legitimate share of social control and for their role of facilitators of the dynamics of social cohesion. The institutions, especially in depressed economies, have roles that they should play, determining institutional excesses with perverse outcomes: too much politics, too much bureaucracy, too many rules, too much uncertainty, discretion, laxity and amnesties. This is at the expense of the social component, which instead should participate to a greater extent and with greater accountability to the dynamics of territorial development (Vespasiano and Martini, 2008: 130). That's why the performance of a strategic planning process leads to profound changes in the decision-making power of the government. The local authority, which makes use of inclusive decision-making processes of the stakeholders in the development of the strategic plan, can not avoid starting similar processes within their organization in order to involve senior management, employees and citizens in

decision-making organization. This active involvement requires executives to assume a role of stakeholders inside and get used to the negotiating objectives and priorities through dialogue and discussion with colleagues from different areas and departments of the administration. This active involvement asks executives for assuming a inside stakeholder role and getting used to the negotiating objectives and priorities through dialogue and discussion with colleagues from different areas and departments of the administration.

Who wants to play around with the local development process first of all has to face the resistance territorial and it must be done by starting from the perverse mechanisms of the local culture, in order to transform it into a real engine of development: without it, or against it is not possible initiate or support any local development process. From this perspective, then, it appears that the presence of the ruling class - made up of social actors able to analyse reality, think of a development process, mobilize the resources needed to accomplish this process, produce cultural consensus (even before the political and economic) – it appears to be the mainstay of the engine of development.

If the formed local culture and the human resources should be considered the engine of development of the territory, then it becomes essential to invest not only in projects to promote the local culture, but also in training programs of a culture for the population of these territories (Triglia, 1995, 1999).

It is essential to develop and support networks where synergies among institutional actors and collective subjects, both inside and outside the territorial reference, become the most effective and efficient way to produce the mobilization of the best cultural resources available in the area. They are resources related to the local culture, stratified and tacitly passed from generation to generation, which have codified a valuable know-how, but still wasted or misused, because of the shortage of operational capabilities, entrepreneurial, financial (Vespasiano and Martini, 2008: 131). In summary, it can be said that local development is not guaranteed by the mere existence of one or more factors propulsion. Social capital - alone - is not enough to start territorial development processes; it must and can be increased through appropriate actions networking of different components of society. This naturally requires the availability of: a significant political capital (not only in the form of a strong local leadership, but a strong representation and accountability to the city) necessary for the animation of the entire process; a cultural capital and civil equally significant, revealed the availability of urban actors to interact seamlessly outside the usual channels and economic power, and the ability to diagnose and imagination; an organizational capital public oriented not only to the efficiency of the various projects of the local administration, but the facilitation of consensus and collective decision (Presidency of the Council of Ministers, 2006: 39-40). The combination of all these elements allow to set an effective strategic planning path , which is not a simple agenda of projects, but the outcome of a

true path of rethinking and re-launch of the territories, by focusing on the interaction between government, society and civil market. Good governance (good governance) means precisely an effective state, a civil society mobilized and a productive market capable of ensuring the reduction of corruption, the consideration of minorities, the participation of the weakest in decision-making and therefore sustainable human development. In other words, good governance is facilitated by effective governments that create legal and political environment favourable to economic growth and the right distribution of wealth. But it all depends on and much to a civil society “lively” able to mobilize groups and communities, facilitate interactions political and social, generate capital and social cohesion (Martini and Serluca, 2012: 262).

CROSS-BORDER ACQUISITIONS AND CULTURAL DISTANCE: THE IMPACT ON PERFORMANCE OF TARGET FIRMS

Matarazzo, Michela¹; Biele, Antonio²; Resciniti, Riccardo²

¹Department of Economic and Business Sciences, G. Marconi University, Rome, Italy

²Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

ABSTRACT

The present paper aims at analyzing the influence of cultural distance on acquisitions from foreign investors of Italian mid-sized firms in terms of the economic performance of target firms. The research covers two main topics. The first one, related to cross border acquisitions, is quite wide, and it is either focused on acquirer's or acquired's perspective in order to understand whether or not the acquisition performance of these firms increases. The second topic, concerning cultural distance, is particularly relevant in studies on the internationalization strategies of firms. Among them, a variety of works has focused on cultural distance as an explicative variable of the results of cross-border acquisitions. Using data from the Mediobanca Research and Studies Database we analyze Italian mid-sized firms acquired from foreign investors between 1999 and 2009, in order to understand whether or not their performance improved over the post-acquisition period. Using a multidimensional measure of cultural distance, we tested the relationship between cultural distance and target firm's performance in cross-border acquisitions by means of a regression analysis. Our study is the first to examine the impact of cultural distance on post-acquisition performance using a sample of Italian mid-sized firms. The findings support our suggestion that cultural distance has a negative effect on post-acquisition performance.

Keywords: *cross border acquisitions, performance of target firms, cultural distance, mid-sized firms.*

INTRODUCTION

The increase in foreign direct investment in industrialized countries since the mid-1980s has largely come about through mergers and acquisitions (M&As) and, as a result, the share of foreign ownership in the total population of firms has grown in many countries. Yet, despite suggestions of increased cultural homogeneity due to the consequent growing interdependence of national economies, firms continue to struggle or fail in foreign markets because of their inability to appreciate and overcome cultural differences. According to the globalization trend, cultural distance has received significant

attention in international business research and it is among the most commonly applied constructs in the research on the internationalization strategies of firms. Hofstede (1980, 25) defines culture as “the collective programming of the mind which distinguishes the members of one human group from another”. According to GLOBE Project, culture is the set of “shared motives, values, beliefs, identities, and interpretations or meanings of significant events that result from common experiences of members of collectives and are transmitted across age generations” (House et al., 2002). The cultural dimensions of Hofstede’s model (Hofstede, 1980; Hofstede et al., 1988; Hofstede, 2010) have been largely used in the international literature to describe the phenomenon of the firms’ internationalization through Kogut and Singh’s index (1988). Of course, they are also a relevant variable in cross border acquisitions especially when there is a significant national cultural distance between acquirers’ and targets’ countries of origin.

The literature on cross-border M&As rarely investigates the relationship between national cultural distance and target firm’s performance after the acquisition. Extant studies only report ambiguous, inconclusive and sometimes contradictory findings (Sthal, Voigt, 2008). There is no unequivocal evidence that national cultural distance influences either positively or negatively the post-acquisition performance of the target firm. In this study we also deal with the question of whether or not cultural differences matter in M&As by investigating a sample of Italian mid-sized firms acquired from foreign investors between 1999 and 2009. Our observation window is relevant to this study as in this period Italy witnessed a rapid increase in inward FDI, mainly through mergers and acquisitions in absolute terms: 486 Italian acquired companies in the 2010-2014 time-frame, for a value of € 54 billion (KPMG, 2014). As a result, the share of foreign ownership in the total population of Italian firms in the last years has grown. Well-known former Italian-owned firms have changed ownership and are still nowadays foreign-owned. Our study is the first to examine the impact of cultural distance on post-acquisition performance using a sample of Italian mid-sized firms.

Methodologically, over the sample period, the MBRES (Mediobanca Research and Studies) database includes 143 completed acquisitions between a foreign acquirer and an Italian mid-sized target firm. We analyzed the post-acquisition performance of a sub-sample of 80 firms surviving as autonomous companies with a foreign ownership in order to understand whether or not they improved. The findings support our suggestion that cultural distance has a negative effect on post-acquisition performance.

The paper is structured as follows. In section two we look at the relevant theoretical concepts and empirical findings of existing literature. In section three, data and sample characteristics are presented, section four discusses the results. Section five concludes.

2. THEORETICAL BACKGROUND AND HYPOTHESIS

The benefits of cross-border acquisitions for the target firm

The literature on cross-border M&A can be divided into two main stream of research. On the one hand, the literature on industrial organization has explored the consequences of ownership changes on the performance of merging firms. Within this context, Lichtemberg and Siegel (1987), analyzing the effects of the ownership change of almost 20,000 US manufacturing plants, found relative increases in the total factor productivity as well as in the total labor input. McGuckin et al. (1995) described the quicker growth in labor productivity of acquired plants in the US food industry. However, it is worth observing that this literature does not separate domestic from cross-border M&As. On the other hand, the literature on multinational enterprises (MNEs) has investigated the impact of the foreign presence in host countries. It is traditionally assumed that foreign-owned firms have a wide performance advantage over their domestic counterparts. The reason most frequently given is a specific comparative advantage of multinational enterprises (MNEs) (Dunning, 1988; Caves, 1974). John Dunning's Ownership, Location, Internalization (OLI) framework stipulates that an MNE has to have a specific ownership advantage in order to overcome the lack of information and extra costs associated with investing in a foreign country. Therefore, the transfer of superior management or technological skills, such as higher quality, more efficient production, better marketing or stronger brand name, to the foreign subsidiary upon acquisition should enhance performance, especially productivity. This assumption seems to be supported by empirical evidence. Davies and Lyons (1991), Driffield (1977), Girma et al. (2000) or Griffith and Simpson (2001) found that foreign-owned firms record higher productivity than domestically-owned firms. However they did not distinguish M&As from Greenfield Investments.

Such issues have only been tackled rather recently for cross-border M&As (Conyon et al., 2002; Bertrand and Zitouna, 2008; (Heyman et al. 2007; Bandick, 2011) (Chen, 2011; Chari, Chen and Dominguez, 2012). Bertrand and Zitouna, 2008, others at firm level (Piscitello and Rabbiosi, 2005; Chen, 2011). Whilst these studies seem to support the above-mentioned theory of multinational enterprises, by emphasizing the increase of target firms' performance, we want to investigate whether or not the acquirer's cultural diversity has a role in determining the performance of the target firm.

Cultural distance and firms' post-acquisition performance

Consistently with the cultural distance hypothesis, which, in its most general form, suggests that the difficulties, costs, and risks associated with cross cultural contact increase with growing cultural differences between two individuals, groups, or organizations (Hofstede 1980), extensive empirical research on International Business has shown that cultural differences are negatively associated with M&As performance. However others (e.g., Morosini et al. 1998) observed a positive relationship or

found cultural differences to be unrelated to the performance of firms engaging in M&As activity. These ambiguous results call for further theoretical and empirical research directed at the cultural dynamics of M&As. A recent meta-analysis (Magnusson et al. 2008) found that the effects of cultural differences on firm performance are becoming increasingly negative. This may be due to cultural overconfidence. While there is undoubtedly a gradual integration of national economies, it appears we are still a long way from the “flat world”.

Just as with internationalization theory, Transaction Cost Economics recognizes cultural differences as a key determinant of transaction costs. Cultural differences introduce uncertainty making it more difficult for the firm to predict future events and amplify costs owing to the liabilities of foreignness (LOF). Cultural diversity can be a cause of increased intra-firm complexity at several levels, for at least two main reasons. First, when a firm operates in multiple, culturally diverse markets, this requires it to tailor itself to numerous foreign national cultures, creating complexities in dealing with different beliefs, behaviors and perceptions (Barkema and Vermeulen, 1998). Second, complexities are further expected to arise through differing firm-level characteristics, such as conflict management, decision-making, and leadership styles (de Jong and van Houten, 2014).

Although culturally diverse operations can lead to improved insights and learning opportunities (Morosini et al., 1998), increasing levels of cultural diversity will lead to increased coordination, agency and transaction costs, all negatively related to firm performance (Tihanyi et al., 2005).

In line with the studies suggesting a negative relationship between national cultural distance and post-acquisition performance, our key hypothesis is expressed as:

Hypothesis 1: The higher the national cultural distance between acquirer and acquired firm, the lower the post-acquisition performance of the target firm.

3. METHOD

The sample

In this study, we focus on acquisitions of all mid-sized firms operating in Made in Italy industries. This is because they are particularly attractive due to their competitive strength which resides in the diversification of their products, most of which may be classified under the umbrella of Italian style, their managerial and entrepreneurial governance styles, structure and flexibility, international development and effective niche strategies (Coltorti et al. 2013; Matarazzo, 2013). The sample was extracted from the Mediobanca Research and Studies database. The selection procedure of the medium-sized firms taken over by foreign ownership concerns the 1999-2009 time-frame and shares higher than 50% of the share capital, or with lower share where there is transfer of management powers (table 1). In

order to understand the effects of national cultural distance on post-acquisition performance, we analyze data over a five-year period, including the acquisition year and the following four years.

Year	Number of firms
1999	3606
2000	3972
2001	4106
2002	4100
2003	4072
2004	4152
2005	4208
2006	4477
2007	4677
2008	4092
2009	3332

Table 1. *Number of firms by year*

On the side of the acquiring firms, the majority is located in the European Union (63.6% of the total), while 21.7% are located in the USA and 14.7% in other countries. 94.4% of the foreign acquirers here considered come from advanced economies, and only 5.6% come from developing countries and emerging economies. Most of the acquiring firms are based in the USA (21.7%), followed by the UK (12.6%) and France (11.2%).

On the acquired firms' side, 49.6% of them belong to the mechanic industry, and 18.2% belong to the chemical and pharmaceutical industry. Together, they represent about 68% of the sample. The other target firms belong to the personal and household goods industry (14.7%), to the food industry (9.8%), to the printing and paper industry (3.5%) and to the metallurgic industry (3.5%). 0.7% of the sample belongs to other manufacturing industries.

47.5% of the 143 acquired firms of the sample come from the northeast of Italy, while 42% come from the northwest. Thus, 89.5% of the acquired Italian firms are located in the north probably because in northern Italy there are more firms, or they are more attractive for foreign acquirers.

The 61 firms removed from the “observed database” present gaps in the budget series due to: merger (25 cases), winding up, bankruptcy, closure (15), double ownership change in the period concerned, namely restoring of the Italian leadership (14), new constitution (6), other reasons (4).

Table 2 shows the number of identified and observed companies per year and the percentage of observed companies on the total, per year.

Acquisition year (t)	"Identified" companies (a)	"Observed" companies (b)	b / a (%)
1999	11	4	36,4
2000	10	6	60,0
2001	14	7	50,0
2002	9	5	55,6
2003	7	5	71,4
2004	7	4	57,1
2005	13	9	69,2
2006	16	12	75,0
2007	22	11	50,0
2008	26	13	50,0
2009	8	3	37,5
TOTAL	143	79	55,2

Table 2: "Identified" database and "observed" database

Out of the 79 observed companies, two were excluded because of the lack of data about their cultural distance and turnover of 2013. Thus, the final sample is composed of 77 acquired firms.

Table 3 shows the country frequencies for the 77 acquisitions of the sample. The USA have the highest number of transactions, corresponding to 20% of the total. European countries completed 58 acquisitions out of the 77 analyzed, that is 71.4% of the sample.

Acquirer's country	Number of acquisitions	% on total
USA	15	20
UK	13	17
France	9	12
Germany	7	9
Holland	6	8
Switzerland	4	5
Austria	3	4
Japan	3	4
Spain	3	4
Belgium	3	4
Portugal	2	3
Sweden	2	3
Luxembourg	1	1
Singapore	1	1
China	1	1
Ireland	1	1
Finland	1	1
India	1	1
Denmark	1	1
Total	77	100

Table 3: Number of acquisitions by the acquirer's country of origin

In the concerned period, the largest number of acquisitions in the sample was recorded between 2006 and 2008, with a peak of 13 in 2008, as shown in table 2. Immediately after that year there was a dramatic decline, probably due to the global economic crisis that brought more caution in international investments.

The variables

Dependent variable: performance is measured as Sales Growth, ROE, Productivity and EBITDA over a four-year period after the acquisition, including the acquisition year and the following four years. We used these variables because, following an acquisition, the target company becomes part of its acquirer's network, gaining the opportunity to expand its market all over the world. Thus, these measures of performance enable us to assess the success of the acquired firms in the post-acquisition period.

Independent variable: the key independent variable in this study is national cultural distance. Following a wide number of prior studies (e.g. Ellis, 2008; Fang and Zou, 2009; Habib, Zurawicki, 2002; Jiang et al., 2009; Morosini et al., 1998; Yu et al., 2013; Slangen, 2006), national cultural distance is measured through the Kogut and Singh's index (1988), based on Hofstede's (1980) national cultural scores. Thus, we used the Kogut and Singh's multidimensional formula (1988) in order to estimate the cultural distance between Italy and the other 19 countries considered, along with Hofstede's power distance, uncertainty avoidance, masculinity/femininity, individualism, long term orientation and indulgence versus restraint scores, updated to 2010:

$$DC_j = \sum_{i=1}^6 \left\{ (I_{ij} - I_{iu})^2 / V_i \right\} / 6$$

In line with Slangen (2006), we consider Kogut and Singh's index to be the best measurement tool of national cultural distance available, as the scores on Hofstede's dimensions are available for a large number of countries and many studies have used it to assess the impact of national culture on firms' performance. Hence, it is easy to compare our findings with those of other researchers.

Control variables

In this study, some control variables were used to control for exogenous effects on the acquired firms' performance.

The Relatedness variable is based on the industry of acquirers and target firms (Morosini et al., 1998). If the two companies are in the same industry, the acquisition receives a relatedness score of one; otherwise, it receives a relatedness score of two. We control for relatedness because it has been found to have positive effects on post-acquisition performance (Morosini et al., 1998).

The Year and Industry variables are included to control for their effect on the target firms' performance (Morosini et al., 1998; Piscitello and Rabbiosi, 2005). In order to understand whether the global

economic crisis has had an impact on performance or not, we use dummy variable that receives score of one if the acquisition took place before 2007 (included), two if the acquisition took place after 2007. Controlling for the acquisition year was necessary because national and international economic and financial conditions varied during the period considered, and this had a clear impact on the performance of all acquisitions. Moreover, important political, economic and financial changes took place in Italy during the period under investigation.

The Industry variable is introduced in order to control for industry effects on post-acquisition performance of the target firms in the sample (Piscitello and Rabbiosi, 2005). It receives a score of one if the acquired firm belongs to the food industry; two if it belongs to the personal and household goods industry; three if it belongs to the printing and paper industry; four if it belongs to the chemical and pharmaceutical industry; five if it belongs to the mechanic industry; six if it belongs to other industries.

The Macro-area variable measures the geographical origin of the target firms (Karpaty, 2004). We control for it because the specificity of the regional context where the acquired firms operate may affect their post-acquisition performance. Hence, this variable receives a score from one to four, depending on the geographical region of the target firms. It receives a score of one if the acquired firm comes from the northwest of Italy; two if it comes from the northeast of Italy; three if it comes from the center of Italy; four if it comes from the south of Italy.

Finally, we control for the uncertainty avoidance, because literature has shown that it may influence the post-acquisition performance of the target firms (Morosini et al., 1998). In order to control for uncertainty avoidance in this research, the Hofstede's (2010) national culture scores for the uncertainty avoidance of the acquiring firm's country of origin are used.

A large number of studies control for the firms' size (e.g. Bertrand, 2009; Bertrand and Zitouna, 2008; Chari, Chen and Dominguez, 2012; Heyman et al., 2007; Karpaty, 2004). However, the sample of this analysis is only composed of medium-sized companies. For this reason, we believe it is not necessary to control for size.

The model

The hypothesis is tested on the acquisitions sample by using the multiple linear regression.

At the theoretical level, the multiple linear regression equation takes the following form:

$$Y = \beta_0 + \beta_1 X_1 + \dots + \beta_m X_m + \varepsilon$$

where β_0 is the intercept, and $\beta_1, \beta_2, \dots, \beta_m$ are the regression coefficient; ε indicates the error of the model.

4. RESULTS

This study analyzes the impact of cultural distance on post-acquisition performance by estimating regression models using different dependent variables expressive of target firms' performance such as Sales Growth, ROE, Productivity and MOL.

The most immediate tool to assess multicollinearity is the examination of the correlation matrix of the independent variables.

Table 4 shows that the most correlated variables are Cultural Distance and Uncertainty Avoidance (-0.563) and dummy variables for the target firms located in the North-West and North-East of Italy (-0.809). In general, given the presence of low values, multicollinearity does not represent a problem in this study. The same conclusion is reached by examining Tolerance and the Variance Inflation Factor (VIF) (table 5).

CD	Kogut and Singh's (1988) cultural distance score between Italy and other 19 countries
YE	Dummy variable for acquisitions that took place before 2007
FO	Dummy variable for the Food Industry
PE	Dummy variable for the Personal and household goods industry
PR	Dummy variable for the Printing and paper industry
PH	Dummy variable for the Chemical and Pharmaceutical industry
ME	Dummy variable for the Mechanical industry
OT	Dummy variable for the Others industry
RE	Dummy variable for Relatedness of the acquisition
NO	Dummy variable for the target firms located in the North-West of Italy
NE	Dummy variable for the target firms located in the North-East of Italy
CN	Dummy variable for the target firms located in the Central region of Italy
CS	Dummy variable for the target firms located in the South of Italy

Table 5: *Tolerance and VIF*

The results of the regression analysis are shown in Table 6. The regression coefficients associated with the cultural distance variable indicate that national cultural distance had a negative effect on post-acquisition performance but this factor was significant only in the model 1 and 4. In other words, the greater the national cultural distance between the acquirer and the target, the lower the Sales Growth and EBITDA over the five-year period considered. This is probably due to the post-acquisition strategies of the acquirers and to the reasons of the acquisitions themselves, or to a low level of cross-border acquisitions experience. In fact, prior experience in cross-border acquisitions may mitigate the negative effects of cultural distance because acquirers are more likely to be aware of inter-country differences and are more skilled at resolving acquisition related conflicts, taking measures to have better performances (Dikova, 2009; Dikova and Rao Sahib, 2013; Hutzschenreuter *et al.*, 2014).

*Significant at the $p < .05$ level

Table 6 - *Results of the regression analysis*

Table 6 also shows that the other variables, namely year, uncertainty avoidance, relatedness and macro area were not significant across all models, thus indicating that they did not have any effect on target firms' performance.

Moreover, among the regression coefficients controlling for industry, in the model 1, only the dummy variable for *Chemical and Pharmaceutical industry* had a positive, and significant, influence on the performances recorded in the four years following the acquisition.

However, it is important to highlight that the target firms' performance in the two-year period 2008-2009 may have been affected by the world economic crisis. Hence, these results should be interpreted with caution.

MANAGERIAL IMPLICATIONS, LIMITATIONS AND FUTURE RESEARCH

The results support the hypothesis of a negative relationship between national cultural distance and cross-border post-acquisition performance, in line with the findings of other studies (Barkema and Vermeulen, 1998; de Jong and van Houten, 2014; Hutzschenreuter *et al.*, 2014; Tihanyi *et al.*, 2005). We

found that cross-border acquisitions have negative effects on the sales growth and EBITDA of the acquired Italian firms in case of higher national cultural distance.

This study suggests that managers of multinationals making acquisitions in culturally distant countries should not underestimate the role of the target's national culture, because it can have a negative impact on the post-acquisition performance of both acquired and acquiring firm. Hence, managers should be aware of the threats and opportunities of the target's national culture, so as to take advantage of its different routines and organizational practices.

This study is not without some limitations. Above all, in this study we used the Hofstede's model (1980, 2001) and Kogut and Singh's index (1988) to assess national culture distance. Even with their widespread acceptance, a growing number of scholars have underlined problematic aspects in Hofstede's model and in the KSI (Shenkar, 2001, 2012; Kandogan, 2012; Tung and Verbeke, 2010; Yeganeh, 2014). In particular, Shenkar (2001) underlines that the Hofstede's model assumes a necessarily linear association between cultural distance and bilateral business relations and it considers culture distance as a stable measure that does not change over time and space, so it does not take intracultural variations within the same nation into proper consideration. The KSI, using Hofstede's measures, carries all their inaccuracies, along with the illusion that cultural distance between two countries is symmetrical and that all of Hofstede's cultural dimensions are equally important (Yeganeh, 2014). Although we were aware of such issues about Hofstede's model (1980, 2001) and Kogut and Singh's index (1988), we used them in order to easily compare our findings with other researches on the same topic. Another limitation is that the sample of the analysis consisted of cross-border acquisitions in which an Italian firm was acquired by multinational corporations predominantly headquartered in Europe or in the United States. Thus, the findings should be evaluated with caution as to their generalizability to the whole world. In addition, the sample consisted only of mid-sized firms. We have chosen to restrict our analysis to mid-sized firms because of their relevance in the Italian economic system. Nonetheless, this could again affect the generalizability of the findings to the entire Italian context. Furthermore, the study looked at the effect of national cultural distance on cross-border acquisition performance, rather than at the process by which managers of the acquiring and acquired firms try to take advantage of national cultural distance, and at the reason why they did not succeed. To better understand those aspects, we think that a qualitative research could be useful and this is left to future research. Finally, it is important to highlight that our results may have been affected by the world economic crisis of the 2008-2009 years. Thus, despite dummy variable year in our models is not significant, the findings should be taken with caution.

Further studies about national cultural distance and post-acquisition performance should explore the specific mechanisms through which cultural factors influence performance, even by using and combining different kinds of research methods.

CREATING TARGETED FISCAL SOURCES OF ROAD CONSTRUCTION IN RUSSIA

Mayburov, Igor; Leontyeva, Yulia

Dept.Finance, Ural Federal University, UrFU, Ekaterinburg, Russian Federation

ABSTRACT

The purpose of the paper is finding a more effective mechanism of accumulating and distributing funds for road construction even more timely and relevant. The paper analyses regional imbalances in the level of car ownership and the development of roads. It is established that the imbalance in road development is more profound than economic imbalances. The authors consider reasons for the slow pace of road network expansion in Russia and look at trends in transport tax revenues and road construction expenditures. It is concluded that there is a number of objective reasons that require far higher spending on road construction in this country in comparison to developed economies. Types of vehicle taxes and fees are studied. It is found that only some of the charges build a link between the amount paid and the intensity of road use by the taxpayer. The hypothesis of the study is to establish that the relationship between transport tax rate and the characteristics of the road network in a region is absence. Sources of government funding for road funds are explored. The research also examines the connection between transport tax rates in various regions, the density of road networks and car ownership levels there. It is established that there is a linear relationship between the tax rates and a low level of car ownership in some regions. The research shows that the fiscal and regulatory role of transport tax should be enhanced in regions with medium, high and very levels of private car ownership.

Keywords: *road network, quality, government revenue, road network funding, transport tax, road maintenance funds.*

INTRODUCTION

The issue of road development is of high importance to any country. It is a particularly burning one in Russia, the largest country in the world. Over the past 20 years, Russia has had to deal with an explosive growth in the number of privately owned cars and an increasingly heavy load on roads. According to government data, the poor quality of roads leads to a loss of around 3 per cent of GDP annually. Substandard roads are the primary reasons for this as poor road surface quality pushes fuel consumption up by 30 per cent and increases the cost of road transport by 50 per cent compared to

those in European countries. This conclusion echoes the Global Competitiveness Report 2013-2014 by the World Economic Forum that placed Russia 136th (out of 144) in the world for the quality of roads (international experts scored road quality in Russia at 2.3 out of 7). (Schwab and Xavier, 2012)

Long distances and underdeveloped roads increase the cost of domestically produced goods and make them less competitive. On average, transportation costs make up 15 to 20 per cent of the ultimate cost of production in Russia, compared with 7 to 8 per cent in developed countries. Poor road quality increases car crash, road fatality and injury rates. Road accidents result in 23.5 deaths per 100,000 population, whereas in European countries the rate is 2.5 times lower and is about 9 to 10 deaths per 100,000 population. The incidence of road accidents has been growing by an average of 10 per cent a year. Traffic accidents negatively affect the country's economic development; experts assess annual losses from traffic accidents at 8 per cent of GDP. (Newbery *et al.*, 1999, Botlikova *et al.*, 2013)

It is quite clear that forced improvement in the quality of the national road network is needed to make the Russian economy more competitive. This strategic task requires a larger amount of investment than earmarked in the federal budget. Funding for investment has to be built up for a long-term period rather than as a lump sum. Against the background of an economic crisis and low natural gas and oil prices that Russia largely depends on for revenue, the government is short of resources for road construction.

The purpose of the paper is finding a more effective mechanism of accumulating and distributing funds for road construction even more timely and relevant. It is equally important to find new fiscal sources of revenue for road funds that would in the long-term perspective shift the financial burden of road development to car owners. The hypothesis of the study is to establish that the relationship between transport tax rate and the characteristics of the road network in the region is absence.

ANALYSIS OF ROAD NETWORK DEVELOPMENT AND STRUCTURE IN THE RUSSIAN FEDERATION

The number of cars in Russia has been growing explosively, with the national car fleet increasing more than twofold during the past 14 years (Tab. 1). At same time, the expansion of the road network is still lagging behind. It is worth noting that although the total length of the road network increased 1.7. times, the length of paved roads increased only 1.4 times. The most alarming fact is that the construction of new paved roads has been going down, with an almost threefold drop since 2000. (Bugakova *et al.*, 2014)

1. The majority of roads are local ones and are owned by local governments. These are urban streets as well as roads connecting areas of a municipality. Local roads make up 43.2 per cent of all paved roads. Local governments are in charge of their maintenance and expansion.

Indicator	2000	2005	2010	2011	2012	2013	Change 2013/ 2000
Total length of the road network, thousand km	898	858	1004	1094	1439	1557	173 %
Paved roadways, thousand km.	752	724	786	841	1038	1094	145 %
Public roads	532	531	665	728	925	985	246 %
including:							
federal motorways	46	47	50	51	51	51	111 %
regional or intercity motorways	486	484	450	452	461	461	95 %
local roadways	164	225	413	473	
Paved road density, km per 1,000 sq. km of territory	44,1	42,4	46,0	49,2	60,7	64,0	145 %
Number of cars per 1,000 population.	130,5	169	228,3	242	257,5	273,1	209 %
Length of new roads brought to completion, thousand km	6,6	2,0	2,2	1,9	2,0	2,5	38 %

Table 1. *Dynamics of car fleet and road network development in Russia*

2. Regional roads belong to regional governments. They connect municipalities within the regions of Russia. Such roads make up 42.1 per cent of the entire road network in the country. Regional authorities are in charge of road maintenance expansion.

3. Private roads are the ones owned by an organization. They provide access to various facilities (mining, production, logistic ones) and connect them to public roads. Private roads make up 10 per cent of all paved roadways in Russia. They are maintained by appropriate companies or organizations.

4. Federal motorways are owned by the federal government. They form links between the regions of Russia and connect them to the national capital and other countries. Such roads account for only 4.7 per cent of Russia's paved roads. The maintenance and expansion of such roads is a duty of the federal government.

Federal motorways constitute the framework of the national road network as they provide international and interregional links. The quality of federal motorways has always been higher than of other types of roads (regional, local ones), but is still very poor. Twenty-five per cent of federal motorways are overloaded; 4 per cent have reached their traffic capacity limit; 56 per cent of federal motorways have pavement strength issues and 37 per cent do not meet roughness standards. Only 8 per cent of federal motorways have four and more lanes. Eight per cent of federal roads are still surfaced with gravel. As a result, 60 per cent of federal motorways are substandard. In areas of the north, Siberia and the Far East a backbone road network connecting all regions of Russia is yet to be built.

When it comes to local and regional roadways, the situation is even more dismal. Some 46,000 settlements with a combined population of around 2.7m have no paved road connection to the national road network.

ANALYSIS OF ROAD NETWORK DEVELOPMENT IN THE REGIONS OF THE RUSSIAN FEDERATION

Russia consists of 85 regions. Analysis of indicators of road network development shows highly uneven distribution of all types of roads in the Russian regions (Tab. 2).

No	Region of Russia	Road density, km per 1,000 sq. km	GRP per capita, thousand RUB.	Cars per 1,000 population	Road length, km	Length of new roads constructed, km	Transport tax rate for cars with engine capacity between 100 and 150 h.p., RUB.
1	Moscow Region	698	349	330,6	30905	28,2	29
2	Belgorod Region	639	355	288,4	17305	83,2	25
3	Ingushetia	629	85	130	2264	43,4	7
4	Udmurtia	238	245	250,5	10003	42,4	20
5	Maritime Territory	89	285	369,6	14657	0,8	20
6	Astrakhan Region	84	208	238,7	411	0,4	27
7	Tomsk Region	23	353	249,9	7105	30,8	6,5
8	Sakhalin Region	21	1298	319,3	1832	60,1	35
9	Komi Republic	15	543	268,1	6260	99,3	20
10	Kamchatka Territory	4	396	484,8	1874	1,2	10
Maximum variability of indicators across regions, times		175	26,0	3,7	75	248	5,4

Table 2. *Indicators of road network development and car use in some of Russia's regions in 2013*

The table presents the data for 10 regions of Russia exhibiting the most extreme variations in road network development. It should be noted that the regions vary considerably in terms of their social and economic development. For example, the GRP (gross regional product) per capita in the wealthiest region is 26 times bigger than in the poorest one. There is an even greater variation in terms of the road network. The difference in the levels of vehicle ownership is always less than fourfold (it is the most variable indicator), whereas the density of road networks in a region might be 175 times higher than in the other. The difference in the pace of road network expansion is bigger still. More specifically, the indicators of new road construction and completion might vary 248-fold in different regions. There is a range of reasons for such variability, including the historically conditioned level of development of the regions and, therefore, different road density values in each of them. One of the

primary reasons, though, is the lack of necessary investment in road development at each level of government: the federal, regional and municipal ones.

ANALYSIS OF SOURCES OF FUNDING FOR ROAD NETWORK

A peculiar feature of public expenditure on road infrastructure over the past 15 years has been the fact that its dynamics are reflective of the country's economic development and are even slightly forward-looking. Growth in spending on the road network is in direct correlation with GDP and state revenue growth (Tab. 3).

Indicator, billion RUB.	2000	2005	2010	2011	2012	2013
Gross domestic product	7306	21620	46309	55800	62599	66755
1. Combined revenues of the Russian federal budget, including:	2097,7	8579,6	16031,9	20855,4	23435,1	24442,7
Fuel taxes	n/a	125,5	169,8	283,5	365,8	418,2
Car excise tax	n/a	5,1	15,1	26,1	33	33,3
Transport tax	n/a	26,0	75,6	83,2	90,2	106,1
Recycling fee	n/a	0	0	0	18,7	49,5
Total for transport-related taxes	n/a	156,6	260,5	392,8	507,7	607,1
Share of transport-related taxes in combined budget revenues, %	n/a	1,83	1,62	1,88	2,17	2,48
2. Total government spending	1960,1	6820,6	17616,7	19994,6	23174,7	25290,9
Spending on road infrastructure, including:	40,3	250,5	645	714,2	990,5	1172,3
spending by federal government	1,9	42,1	281,1	349,5	442,4	504,5
spending by regional governments	38,4	208,3	363,9	424,5	646,3	731,2
Share of spending on road infrastructure in total government expenditure, %	1,92	2,92	4,02	3,42	4,23	4,80
Share of spending on road infrastructure in GDP, %	0,55	1,16	1,39	1,28	1,58	1,76

Table 3. Dynamics of revenues from transport taxes and spending on road infrastructure

At first glance, Russia seems to have been spending enough on its road network. For example, the share of spending on road construction in Russia's GDP compares favourably with that in developed economies. (Doll, 2008, Hysing, *at al.*, 2015) Moreover, in the crisis period of 2009-10, the expenditure growth did not slow down. But the higher share of spending on the road network over the past five years is in general unsatisfactory. The increase in the spending to 1.8 per cent of GDP is insufficient because, unlike the well-established quality road networks in developed countries, Russia's road infrastructure is fraught with imbalances.

First, vast territories in the north, Siberia and the Far East are void of any road construction projects and practically lack a federal road network that would provide uninterrupted connection between all regions. There is also a drastic shortage of paved regional and local roads that would be passable all year round.

Second, maintenance costs are higher because of higher wear and tear to the surface to overloaded roads. The costs are also high because of the damaging impact of extreme temperatures ranging from 40°C to -40°C to the road surface.

Third, the quality of the existing roads and infrastructure is very poor and does not meet international standards.

Fourth, there is a lack of private investment in toll roads as business is not interested in making capital investment in road development because of a long payback period and a low return. (Pinskaya, 2015)

All these are factors that necessitate further growth in public spending on road infrastructure. One of the ways to ensure the growth is by enhancing the fiscal value of transport taxes in Russia.

EXISTING TRANSPORT TAXES AND CHARGES IN RUSSIA

The following levies and charges make the framework of transport-related taxes in Russia (Tab. 4):

No	Levy	Connection between amount paid and intensify of road use by car owner
1	Car sales taxes and fees	no
2	Fuel tax	yes
3	Motor oil excise tax	yes
4	Transport tax	no
5	Pollution charges	no
6	Parking fees	no
7	Recycling fee	no
8	Heavy vehicle use tax (gross weights equal or exceeding 12 tonnes)	yes
9	Mandatory and voluntary insurance	no

Table 4. *Types of transport taxes and charges in Russia*

Car sales taxes are paid by the manufacturer (or the importer) on the sale of cars and motorcycles. The selling of lorries and buses is exempt from excise taxes. The tax rate is progressive.

Fuel taxes are paid by the producer and are included in the price. Tax rates vary for Class 4 and Class 5 fuels. Excise taxes on fuel are designed to establish a link between the mileage of the car and its owner's financial contribution to road funding in the area of fuel purchase. (Duncan and Graham, 2013). This connection works in the following way: fuel tax revenues are accumulated in the federal treasury and distributed among regions for purposes of road construction. The funds are allocated in proportion to fuel consumption in each region. This arrangement implies a strong connection between fuel consumption in the region and traffic load on the road network there. The advantage of the tax is

that it strongly correlates with traffic load on the road network. Excise taxes on motor oils are paid by the manufacturer or the importer and are included in the price.

Transport tax is essentially an ownership tax. The transport tax rate is based on engine horsepower. Tax rates vary for cars, lorries, buses, motorcycles etc. and are highly progressive.

Pollution charges are only payable by legal entities. The charge is applicable to various types of environmental impact: aerial pollution, discharge of pollutants into water bodies, soil pollution, dumping of industrial and consumer waste, noise and thermal pollution. The amount of the charge is calculated by the payer.

Parking fees are paid by car owners for being able to park their vehicle in a designated place (usually in downtown areas) during a specific period of time.

In Russia, the recycling fee is imposed on all vehicles and is paid before their registration with the traffic police. The fee guarantees that the owner won't have to pay for scrapping his car upon the end of its service life. The fee is paid by car manufacturers or importers.

The heavy vehicle use tax a fee levied on heavy lorries operating on public motorways at registered gross weights exceeding 12 tonnes. It is designed as compensation for damage that heavy vehicles cause to roads. The tax will be determined according to the length of the stated route that will be tracked by means of GPS navigation. (Lindsey,2010)

The analysis shows that of the nine types of fees imposed on car owners in Russia only three appear to establish a direct connection between the amount paid and intensity of road use by the car owner.

The main difference between the system of transport taxes in Russia from that in developed countries is that car owners do not appear willing to increase their financial contribution to road network funding. The opportunistic attitudes among the majority of taxpayers are due to their conviction that their payments dissolve in combined budgets and are not specifically spent on the development of the road network. (Lee and Han, 2009; Shaoul *et al.*, 2006) Funding for roads in a majority of countries is intrinsically linked to a system of taxes on road users through so-called road pricing. It defines the key principle of road user charges that are designed to encourage the reduction of users' environmental impact, the preservation of transport links and higher efficiency of the road network, including by means of international shipping regulations. Experience has shown that vehicle levies and road charges prove most effective when the payment for road use is made in the closest proximity to the point of consumption and the size of the charge is set at a level that is close to marginal costs of road maintenance.

SOURCE OF FINANCING OF ROAD FUNDS

Russia used to have road maintenance funds between 1991 and 2000. They were the exclusive source of funding for road infrastructure. At that time, road funds were off-budget entities with dedicated tax revenues and strictly targeted spending goals. Road funds were disbanded in 2000 and road infrastructure started to receive public funding from all levels of government. Since their revival in 2012, road funds have been in charge of designing, building, renovating, repairing and maintaining the road network. At the same time, the Federal Road Fund was established and the regions and municipalities were given the right to set up their own regional municipal road funds. The difference is that today road funds are part of government budgets and their source of revenue is a share of combined revenues of appropriate government budgets.

Federal law establishes the following dedicated sources of sizable revenue inflows to the Federal Road Fund:

- 1) Excise taxes on petrol, straight-run petrol, diesel fuel, motor oils payable to the federal budget;
- 2) Income derived from the use of property that is part of federal public roads;
- 3) Income derived from the lease of land within federal public road reserves;
- 4) Transit fees on foreign vehicles;
- 5) Heavy vehicle use tax (applicable to vehicles with a gross weight equal or exceeding 12 tonnes);
- 6) Fee for connecting motorway service areas to federal public roads;
- 7) Fines for violating freight dimensions and weight limits;
- 8) Subsidies from the government budgets of the Russian Federation;
- 9) Donations from individuals and businesses.

The following priority sources of revenue are dedicated to regional road funds:

- Income from excise duties on petrol, straight-run petrol, diesel fuel, motor oils payable to the budget of the Russian region;
- Income from transport tax;
- Other revenues defined by the local law establishing a regional road fund.

TRANSPORT TAX AS A PROMISING SOURCE OF REVENUE FOR REGIONAL ROAD FUNDS

Transport tax is a promising source of revenue for regional road maintenance funds. The Russian model of transport tax has the following specific features.

First of all, a wide range of means of transport is taxable. There is a specific tax base for each kind of transport. At the same time, the overwhelming part of taxable means of transport – almost 99 percent -

are motor vehicles. Boats and aircraft (including jet-propelled ones) make up slightly over 1 percent of all taxable means of transport. Consequently, taxation is primarily based on engine capacity.

Second, tax rates are set in roubles per one horsepower of engine capacity. The tax is progressive, with the most notably higher rate progression for automobiles. For example, the tax rate for cars with an engine capacity exceeding 250 h. p. is six times higher than for cars with an engine capacity up to 100 h. p, while for trucks the rate is only three times higher. Such an approach to rate differentiation takes no account of vehicles' environmental class and does not allow for compensation of negative externalities incurred by the territorial community.

Third, transport tax in Russia is a property tax, i.e., it is related to the ownership of the vehicle). Owning a luxury car is subject to a tax markup that could hike the tax rate by up to three times.

Fourth, transport tax is a regional tax. It is not a target tax and is fully payable to the region.

STUDY OF CORRELATION BETWEEN TRANSPORT TAX RATE AND CAR OWNERSHIP LEVEL IN A REGION

The regions of Russia can introduce differentiated tax rates for each category of transportation means (the standard tax rate can be increased or decreased, but not more than tenfold). This right is granted to them by the federal government. It would be interesting to establish whether there is a correlation between the transport tax rate and the level of car ownership in the region. In theory, the correlation should exist because higher tax rates would restrict the demand for private cars in regions with a high level of car ownership. Similarly, lower transport tax rates would encourage people to have a car in regions with a low level of car ownership. The tax rate should also be higher in regions with a more developed road network.

To establish the dependence, we analyzed all 85 regions of the Russian Federation to see if there is a correlation among transport tax rates, road density and car ownership levels in the regions. Our conclusion is that there is no correlation between the tax rate and the density of the road network in a region.

A more thorough look at the levels of car ownership in the regions allows for a conclusion to be drawn that there is a certain non-linear relationship amongst these parameters. The graph below characterizes the dependence of the tax rate on the level of car ownership in the region, while the approximation equal to 0.16 implies weak correlation of these parameters (Fig. 1).

Figure 1. Dependence of transport tax rates (vertical axis) on car ownership levels (horizontal axis) in the regions of Russia in 2013

The graph shows a parabolic relationship between the two parameters. Let us examine some parts of the relationship. To do that, we shall cluster the regions into four big groups: (1) those with low levels of car ownership (up to 200 cars per 1,000 population); (2) those with a medium level of car ownership (200 to 250 cars per 1,000 population); (3) those with a high level of car ownership (between 250 and 300 cars) and (4) those with a very high level of car ownership (over 300 cars per 1,000 people) that leads to strong car dependency. What is really interesting is that the regions with medium, high and extremely high levels of car ownership do not take advantage of the regulatory function of transport tax and are not inclined to increase the tax rate. The story is completely different in regions with low levels of car ownership. There one can identify a linear correlation between the tax rate and the level of car ownership.

Car ownership in the region (cars per 1,000 population)	Pearson correlation coefficient	Critical value of Pearson coefficient for a certain number of degrees of freedom ($p=0,1$ two-tailed)	Number of regions	Correlations
Less than 200	0,6784	0,6215	8	yes
From 200 to 250	0,0878	0,3687	21	no
From 250 to 300	- 0,0125	0,2746	37	no
Over 300	- 0,1772	0,4124	17	no

Table 5. *Study of linear correlation between transport tax rate and level of car ownership in a region*

Consequently, the regions with medium, high and extremely high levels of car ownership have significant reserves for increasing the fiscal value of the transport tax. The tax should be made purpose-specific so that it would be a source of dedicated revenue for regional local road maintenance funds. The tax rate should depend on the level of development of the road network in the region and car ownership rates there.

CONCLUSION

The poor quality of roads in Russia negatively impacts population mobility, drives up the cost of production, car crash, road traffic death and injury rates. This leads to considerable economic losses that might amount to 10 per cent of GDP. At the same time, spending on road infrastructure increases annually, but never exceeds 2 per cent of GDP. Investing more in the development of the road network might yield considerable economic benefits for the budget in the future.

The establishment of federal, regional and local road funds should be viewed as a positive factor for the development of the road network in Russia. The funds will accumulate targeted financial resources from appropriate government budgets and expand federal, regional and local roads. It is also advisable to dedicate revenues from relevant transport levies to specific road funds.

It is necessary to increase the financial contribution of car owners to road funding. More specifically, it is necessary to enhance the fiscal and regulatory capacity of transport tax. The tax rates should be hiked up in the regions with a developed road network and a high level of car ownership.

²Department of Economics, law and accounting studies, IULM University, Milan, Italy

ABSTRACT

Employee brand consistent behavior spurs from an inside-out process that starting from organizational context lead to brand outcomes throughout the impact of managerial strategies on employees' attitude, intentions and behavior.

A theoretical study, 32 interviews with internal communication managers of Italian and American leading companies, and a case study on a retail company, showed that during the inside-out process of brand building, human resource management, managerial communication, internal communication, and communication climate are interrelated leverages that need to be integrated in an effort of creating a favorable context facilitating genuine, discretionary and extra-role employee brand consistent behavior.

Furthermore, the study revealed that the most spread internal communication strategies aimed to sustain such employee brand builder role are *enablement-focused*. Managerial strategies should mostly be devoted to earn loyal behavior of employees rather than to prescribe desirable employee behavior.

Future research is required to develop and test constructs and measures suitable for the current organizational contexts with an increasing diverse workforce, capturing the voice of employees. Major managerial implications show that companies should engage employees as brand ambassadors not by means of in-role behavior prescriptions and control techniques but rather by means of enablement strategies based on the creation of an organizational context leading to genuine, authentic, voluntary, extra-role brand consistent behavior.

Keywords: *brand, brand ambassador, brand building behavior, brand building strategies, enablement strategies, extra-role behavior, employee communication, organizational strategies*

1. INTRODUCTION

Brand experience (Pine, Gilmore, 1999; Schmitt, 1999; Keller, 2003; Kapferer, 2012) and consumer brand engagement (Aaker, 1991; Bowden, 2009; Schultz, Block, 2011; Smaoui, Behi, 2011) are growing relevant issues in marketing studies. Among the customer experience providers (Schmitt, 1999) the employee-stakeholders interaction plays a major role (Henkel et al., 2007; Sirianni et al., 2013). The traditional borders between internal and external relations (Hatch, Schultz, 1997) are increasingly blurred due to phenomena like networking, outsourcing and internationalization of business processes that intensify interactions between organizational members and outsiders, namely stakeholders and, in particular, customers. Furthermore, the pervasive usage of social networks sites increasingly exposes employees to interactions with stakeholders, often without any control from the organization (Cornelissen, 2014; Dreher, 2014; Einwiller, Steilen, 2014; Rokka et al., 2014).

The awareness about the relevance of employee behavior for brand outcomes is strong, but the issue of managerial strategies for promoting employee behavior sustaining the brand is still unanswered (Vallester, de Chernatony, 2006; Henkel et al., 2007; Kim, 2011; Parrk et al., 2014).

This paper tries to contribute to fill this gap presenting the main findings of a long-term research project regarding company's strategies to nourish brand consistent behavior of employees, meant as conscious communication efforts purposefully performed by employees to sustain the company success in its various forms. The paper elaborates on three original studies to offer theoretical, research and managerial suggestions emerging on the overall.

First, the paper presents a holistic model of brand building process based on employee brand consistent behavior (Mazzei, Ravazzani, 2015). Second, it discusses findings from an interview-based study on 32 Italian and American companies aimed to understand what kind of strategies communication managers are adopting in order to sustain employee brand consistent behavior (Mazzei, 2014). Third, the paper describes a case study of a retail company to investigate a specific brand consistent behavior of employee: the brand ambassadorship efforts (Mazzei, Quaratino, 2014). Finally, it concludes with theoretical, research and managerial implications.

2. BRAND CONSISTENT BEHAVIOUR OF EMPLOYEE: A HOLISTIC MODEL

Employee brand consistent behavior includes an array of verbal and non-verbal employee behaviors, prescribed or discretionary, that during the interaction with customers are able to generate valuable outcomes in terms of customer and brand experience and have been included in the expression of behavioral branding (Mazzei, Ravazzani, 2015). Employee behaviors conveying brand values have

been defined in many ways: brand citizenship behaviors (Burman, Zeplin, 2005), brand supporting behaviors or brand-adequate behavior (Vallaster, de Chernatony, 2006), brand consistent behaviors (Henkel et al., 2007), behavioral branding (Punjaisri et al., 2009), and brand-aligned employee behavior (Sirianni et al., 2013).

Employee brand consistent behavior confirms the brand promise (Punjaisri et al., 2009) and positions a brand in customers' mind (Henkel et al., 2007). Employees familiar with the brand values are able to "live the brand" (Bendapudi, Bendapudi, 2005) and become brand ambassadors (Vallaster, de Chernatony, 2006) or brand builders (de Chernatony, 1999).

During their interactions with customers, employees affect several brand outcomes as corporate and product branding (Henkel et al., 2007; Gremler, Gwinner, 2008; Punjaisri et al., 2009), the overall brand evaluation and the customer-based brand equity (de Chernatony, 1999; Henkel et al., 2007; Sirianni et al., 2013).

A holistic model of behavioral branding (Mazzei, Ravazzani, 2015) suggest that several contextual conditions affect the employee behavior capable of generating or limiting brand competitive outcomes and that there are several intermediate steps in the path leading from contextual conditions to brand competitive outcomes (Mazzei, Ravazzani, 2015): the cognitive and emotional states of employees, their attitudes, behavioral intentions, and brand consistent behaviors.

a) Contextual conditions encompass variables that can be intentionally and strategically planned, managed and evaluated by a company: management techniques and human resource management practices (Punjaisri et al., 2009); communication climate and internal communication (Smidts et al., 2001; Thomas et al., 2009; Jo, Shim, 2005; O' Neil, 2008; Sharma, Kamalanabhan, 2012); managerial communication style (Dasgupta et al., 2013, 2014; Botero, van Dyne, 2009; Maddolock, Kennedy-Lightsey, 2010).

b) Employee cognitive-emotional states include employee satisfaction (Brown, Lam, 2008; Wangenheim et al., 2007), occurring when employees perceive that their expectations are fulfilled by the company; employee brand identification (Punjaisri et al., 2009; Madlock and Kenney-Lightsey, 2010), conceived as employee sense of belonging to the brand and pride to be its builders and ambassadors; employee brand commitment, that is the extent of employee emotional attachment to the brand (Punjaisri et al., 2009; Ki, Hon, 2012); employee brand loyalty (Punjaisri et al., 2009), that indicates the willingness to maintain a personal relation with the brand and contribute to its success. Employee cognitions and emotional states mediate the effects of contextual conditions on attitudes and behavioral intentions.

c) Employee brand attitudes towards the brand represent an evaluation (Ki, Hon, 2012) of the brand and indicate the degree to which employees have a favorable or negative opinion, like or dislike the brand. Employee brand attitudes affect brand behavioral intentions, according to the theory of planned behavior (Fishbein, Ajzen, 1975).

d) Employee brand behavioral intentions are distinct from real behaviors and include the predisposition of employees to perform brand consistent behaviors. The degree to which an employee has a favorable or unfavorable evaluation or appraisal of the brand affects his or her behavioral intentions, which are the immediate determinant and most reliable predictors of behaviors (Ki, Hon, 2012).

e) Employee brand consistent behaviors include the ability to identify customer needs and help customers (Gremier, Gwinner, 2008); perform supportive communication behavior as recommend the brand in both work and extra-work situations, defend it from criticism, avoid to criticise it, report to managers information and personal or customers' opinions for the development of the brand (van Vuuren et al., 2007; Burman, Zeplin, 2005; Kim, Rhee, 2011); convey brand values coherent with the brand positioning through verbal and non-verbal communication (Burman and Zeplin, 2005; Henkel et al., 2007), and show inner feelings (Sirianni et al., 2013). Effective brand consistent behavior requires a genuine (or deep) acting consistent with inner actual feelings (Sirianni et al., 2013).

f) Brand-related outcomes of employee-customer interactions include customer satisfaction and brand loyalty (Wangenheim *et al.*, 2007; Brown, Lam, 2008), positive word-of-mouth, and brand equity (Yee *et al.*, 2008; Chi, Gursoy, 2009).

The holistic model of behavioral branding (Mazzei, Ravazzani, 2015) acknowledges the complex, co-constructive and flexible nature of the process and calls for adopting research and managerial approaches that do not deny or oversimplify this complexity. It further underlines the need to engage employees as brand ambassadors not by means of in-role behavioral prescriptions and control techniques, but more indirectly and genuinely through the management and enhancement of distal and proximal variables (Parker et al., 2006) that sustain proactive and discretionary brand consistent employee behavior. In particular, it would be relevant to adopt non-normative practice (Vallaster, de Chernatony, 2006) that facilitates co-construction processes (Wallpach, Woodside, 2009), and to compare the efficacy and peculiarities of this approach with a normative approach based on in-role prescriptions and control techniques.

3. MANAGERIAL STRATEGIES TO ENHANCE EMPLOYEE BRAND CONSISTENT BEHAVIOR: FINDINGS FROM AN INTERNATIONAL STUDY

The holistic model of behavioral branding and the huge literature at its foundation (Mazzei, Ravazzani, 2015) show that a wide range of managerial strategies affect employee brand consistent behavior. Then, a further study tried to understand the kind of communication strategies sustaining the brand consistent behavior of employees adopted by companies.

The study was based on interviews with 32 Italian and American companies carried out in 2011 (Mazzei, 2014). The study collected management perceptions about the relevance of employee communication actions for company competitive performance and if their companies had implemented any internal communication strategy to this end.

The study was qualitative and included interviews and focus groups. The research team selected the companies in the study according to three criteria: 'best in class' in internal communication, heterogeneity in terms of industry, and large in size. Data was gathered by in-depth interviews with internal communication managers and specialists. Two focus groups with Italian internal communication managers and specialists were used to support the interpretation of findings.

The area of investigation comprised: the main aims and activities of internal communication in the companies; the relevance of the employee communication role issue and reasons for that; the employees' and managers' communication behavior considered strategic in the company; the expected benefits for the company stemming from strategic communication behavior; and the internal communication strategies, managerial methods, tools, channels and content, used by the company to enhance employees to adopt strategic communication behavior.

The researchers grouped the contents of interviews according to the significance for the research questions (relevance), the number of occurrences (prevalence), and the originality. All findings were anonymized.

Findings depict a wide range of relevant employee communication behaviors: act as brand ambassadors and advocates; be company allies and ~~to~~ support the business of the company, coherently with the commercial role of employees that interact with clients; share expertise and information with colleagues; communicate openly with leaders to convey ideas and suggestions to improve products and services.

Communication strategies mentioned by interviewees in order to support the communication efforts of employees are sometimes *communication-oriented* and directly linked to the classical internal

communication functions: create communication paths, develop new languages, adopt a full disclosure style, and stimulate effective managerial communication. These strategies design and manage communication instruments and style assuring information adequacy and proper directions (White et al., 2010), spreading communication competencies (Zerfass and Franke, 2013), and strengthening trust (Jo and Shim, 2005).

In other cases communication strategies are oriented to affect employee communication behaviors as an indirect result of their attitudes and future behavior intentions: build trust between managers and employees, build accountability for corporate values, state mutuality, adopt multiple and integrated practices. These are *enablement-oriented* communication strategies: they aim to create communication conditions and integrate communication to other managerial practice to enable the employee communication role (Mazzei, 2014).

The enabling role of internal communication means to develop competencies, instead of giving advices (Zerfass and Franke, 2013), facilitate employees in their communication roles implementing meta-communication, being communication developers, supporting communication training, and linking evaluation and reward systems to communication (Heide and Simonsson 2011).

4. BRAND AMBASSADOR BEHAVIOR OF EMPLOYEES: A CASE STUDY

The two studies described in the previous sections, showed that employee brand ambassadorship is crucial for company success and it depends on an array of organizational conditions. To better understand the implications of such consideration, the researchers developed a case study on a retail company (Mazzei, Quarantino, 2014).

The company is a cooperative firm and in 2013 has about 7,700 employees and 300 stores. It experienced rapid growth, and consequently hired a relevant number of Millennials, employees who had previously worked for other companies, part-timers, and casual workers. As a result, corporate culture, cohesion around corporate values, and motivation of co-workers, were at risk and the management felt out of touch with the workforce, compared with before. This feeling led to the launch of a structured listening program.

After sixteen interviews with leaders, the study consisted of a survey. The questionnaire addressed the following areas: company identity and values, participation, employee internal voice and brand ambassador behavior, responsibility, relationships among generations, commitment, motivation, the quality of relationships, managerial style, and perceived external communication. The study covered a

broad range of issues but this article discusses only the findings related to brand ambassador behavior and its determinant.

The sample of 2,300 employees was randomly selected and stratified by gender, age, seniority, education, employment contract and organizational unit, assuring statistical consistency. The questionnaire was delivered on line over a four-week period and the researchers collected the data directly to ensure the anonymity of the respondents. Overall, 1,870 answers were collected, a response rate of 81%. Data were analyzed using frequency distributions and bivariate joint frequency. The interpretation of the results was supported by findings from the interviews, open comments at the end of the questionnaire, and the literature.

Employees were asked about their brand ambassador behaviors when not in the workplace. They feel that it is natural to provide advice on the company's products and services (72.9%), to talk positively about the organization with acquaintances and relatives (72.6%), and to defend the company from criticism (63.3%). Moreover, they are ready to acknowledge mistakes (40.3%) and to criticize the company (28.6%). Employees act as brand ambassadors in a limited way and at times are even disloyal.

Also, the interviews indicate a critical attitude of people toward the company during their interactions with stakeholders. It seems to be a byproduct of insufficient communication about strategic choices: "I believe that people lack information and the overall perspective needed to promote the company's distinctive brand in the eyes of customers". In other cases, people do not feel loyal to the organization: "Some workers own the loyalty card of competitors", or workers just forget the relevance of their role: "Here people do not fully perceive the risk of criticizing the company outside".

Employees in this company were not strong advocates, and did not volunteer to communicate organizational strengths, but were highly adversarial, and dispersed negative information to external constituencies. This amplifies organizational problems and reduces opportunities and increases threats to the organization (Kim and Rhee, 2011).

The study examined the contextual setting in which the brand ambassadorship behaviors are performed: commitment, perceived company's external communication, and level of motivation.

Commitment to the organization was explored by asking employees opinion about shopping in a competitor's store. 60% of the workers consider it an economic drain on the company. The percentage is apparently high, but taking into account the cooperative nature of the company – that is owned by its customers and workers – and its history, one would expect greater awareness of the economic loss. Furthermore, many workers saw shopping in a competitor's store as a matter of convenience ("I go to

nearest store" 53.8%) and a significant number of them saw it as a normal habit ("It is just normal" 36%). The interviews also underlined the lack of support of workers: "Here many people do not understand how important it is to support the company by buying and promoting its products". In relation to both the survey and the interviews, the level of commitment would appear to be a matter of concern.

Employees' perceptions about the company's external communication are unsatisfactory. On the one hand, workers believe that it fully reflects the values of the company (61%). At the same time, they feel that, "It does not reach all our potential customers" (50.9%), "It is not appealing" (25.5%), and, "It does not express how good we are" (32.9%). Overall, employees seem to lack confidence in the quality of external communication by the company and this perception probably affects their lack of motivation and willingness to become "brand ambassadors" (Schimdt et al., 2001).

The level of individual motivation of employees was explored by asking people about their personal condition inside the organization. On the one hand, they feel "ready to address problems and look for solutions" (59%), which is probably a driver for "voice" behaviors. On the other hand, only the 39.5% of respondents said they were "motivated and satisfied", and there is a widespread feeling of "not being recognized" (56.1%) and of "being discouraged" (43.3%).

Both interviews and free comments from the questionnaire help to explain this widespread feeling: "There is a significant amount of knowledge and competence among employees that is not rewarded or recognized"; "Many people try to contribute with ideas and proposals but often they are not listened to by the management". The feelings of demotivation help to explain the limited efforts of employees to behave as "brand ambassadors", as pointed out by literature on employee satisfaction (Kim and Rhee, 2011; Ki and Hon, 2012).

The attitude of not being strong advocates by employees in this company derives, according to the previous studies in this paper, with weak commitment, unsatisfactory perceived company's external communication, demotivation of employees.

CONCLUSION: DIRECTION FOR THEORETICAL DEVELOPMENT, FUTURE RESEARCH, AND MANAGERIAL IMPLICATION

One theoretical study and two field research projects about employee brand consistent behavior shed light on the inside-out process starting from organizational context and leading to brand outcomes throughout the impact of managerial practices on employees' attitude, intentions and behavior. The

three studies increased knowledge about the antecedents of employee brand ambassador behavior and the strategies companies are adopting to sustain them.

This inside-out process should be considered in its wholeness, looking at each and all steps as intertwined elements mutually interdependent. In particular, human resource management, managerial and internal communication, and communication climate are interrelated leverages that need to be integrated in an effort of creating a favorable context for genuine, discretionary and extra-role employee brand consistent behavior. Managerial practices aimed to sustain employees to be strategic communicators of brand values cannot be based on prescription but they require be negotiating and sharing with organizational members.

A qualitative study based on interviews to 32 internal communication managers of Italian and American leading companies indicates that managers are aware about the relevance of employee brand builder role. Furthermore, the study revealed that the most spread internal communication strategies aimed to sustain such employee brand builder role are *enablement-focused*. Managers declared that the effort is mostly devoted to earn loyal behavior of employees rather than prescribe desirable employee behavior. As a consequence, internal communication has an enablement role instead of a being a means for conveying communication rules.

A case study on a retail company confirmed the relevance of a critical organizational context, with a weak employee commitment, dissatisfactory perceived external communication, and low level of individual motivation, on employee attitudes to be brand ambassadors. In this case, it is not possible to expect strong ambassador behaviors because of the critical organizational setting in terms of communication, managerial style and employees' motivation (i.e. antecedents).

The holistic model of behavioral branding contributes to the theoretical development of the understanding of the antecedents, mediating variables, and consequences of employee brand consistent behavior. From the theoretical point of view it has been clarified the wholeness of the process, the presence of multiple stages chain of effects with mutual relationships that strengthen the process.

Future research is required to develop and test measures of organizational context, employee emotional and cognitive states, employee attitudes, employee behavioral intentions, employee brand building behavior and related brand outcomes. Above all, we need further studies to find proper constructs and measures for the current organizational contexts with an increasing diverse workforce including women, non-western cultures workers, job-hoppers, part-timers, contractors, contingency workers and so forth.

Furthermore, we need to capture the voice of employees implementing both qualitative and quantitative studies to substantiate the range of employee brand building behavior; verify the most relevant variables influencing their attitudes, intentions and behavior; understand whether different groups of employees require customized enablement strategies; and to verify if enablement strategies adopted by companies so far are effective.

Major managerial implications also emerge from the findings. Companies should engage employees as brand ambassadors not by means of in-role behavioral prescriptions and control techniques but through the creation of an organizational context leading to genuine, voluntary, extra-role brand consistent behavior. In order to do this, we suggest, first, the integration of marketing, human resource management and communication, through job rotation plans, joint training programs, inter-functional working groups.

Second, we recommend enablement-oriented practices, consisting of investment for the creation of a communication and organizational context that promote genuine brand consistent behavior. In particular such enabling practices include: programs for both managers and employees aimed at enhancing soft skills and individual motivation to work; training and development project for managers supporting them in building trust relationships with employees, and using open communication; bottom-up participation to decision-making processes through the listening of employees' ideas and suggestions, both formally and informally. Third, we suggest non-normative practice that facilitate the processes of co-construction of implicit and shared values about brand consistent behavior: this means working on the development of the organizational cultures, establishing rituals, symbols, stories and heroes describing and embodying the expected (brand ambassadors) behaviors.

The three studies about strategies to sustain employee brand building behavior discussed in this paper underline the crucial role of employees as brand builders and the need of enablement strategies to enhance their genuine, authentic and non-prescribed extra-role effort to benefit their company and ultimately themselves.

ABSTRACT

The radical changes occurred in recent decades in the tourism sector, largely due to the diffusion of the Information and Communication Technologies, have intensified the competition among tourist destinations. In this scenario, destinations are called to compete at global level by creating an integrated offer able to satisfy the needs and willingness of tourists. Specifically, the creation of regional integrated tourist systems as forms of aggregation and integration between a large differentiated community of actors, directly and indirectly involved into tourism value chain, arises as the main challenge. Based in the above premises, this study aims to deepen how this process of collaborative and synergic growth of a region with a tourist vocation can be managed by promoting the creation of an integrated tourist system.

At this purpose, this work will present the results of a web survey aimed to demonstrate empirically the degree of integration between the different actors of the Apulia tourist system, as regional destination of growing popularity, as well as to derive implications for theory and practice. The results of context analysis evidence the fragmentation of the regional tourism systems, and the low level of cooperation that represents an obstacle to the creation of an integrated tourist offer. Finally, a contextualized model for the development of regional tourism network in Apulia, based on the current situation, will be presented.

Keywords: *integrated tourism system, ICTs and tourism, experiential tourism, tourism network, tourism supply chain, tourism regional competitiveness*

INTRODUCTION

Globalization and the diffusion of ICTs have impacted considerably on tourism sector, enabling the spread of new business models (Del Vecchio *et al.*, 2014). Nowadays, tourists are increasingly interested in living an experience resulting from a variety of goods and services connected to the nature of the

region they visit. In this context, tourism operators are called to offer an “all-inclusive” package solution able to incorporate that large number of products/services that compose the tourist experience (Buhalis *et al.*, 2008).

Focusing on the new technological trends, the growing diffusion of social and mobile applications can be surely assumed as the main factors behind the changes occurred in the tourists’ consumption; at the same time those trends have also caused the emergence of new forms of tourism, as the experiential tourism (multidimensional and cross-thematic).

Additionally, those technologies have produced a growing competition among geographical destinations in terms of opening of new markets (Silvestrelli and Agazzani, 2002) and the progressive disintermediation of traditional distribution channels, accompanied by the spread of a multi-channel offering.

The current economic environment allows to comprehend how the competitive challenge of destinations can be afforded through the glance of the local territorial systems (Pilotti *et. al.*, 2013), by stressing the interdependences between companies, institutions, individual actors, companies directly and indirectly linked to the traditional configuration of a tourism supply chain. In tourism, in fact, the competition takes place not only or not so much between individual player or locations, but increasingly among ecosystems (Del Vecchio *et al.*, 2014). Defined as multiactors and knowledge-intensive environments supporting the process of entrepreneurial growth of a regions (Romano, et al., 2104) the ecosystems are suitable contexts to provide concrete solutions at the changeable demand of tourists (Pilotti *et. al.*, 2013).

The importance of territorial systems in the debate on competition of tourist destinations is clear in the literature; some authors have focused on the drivers of competitiveness of tourist destinations, seen as structural and environmental factors (Govers and Go, 1999), or factors related to the share capital (Senn, 2002) or relational and innovative capacity (Buhalis, 2000). Others have identified these drivers of competitiveness in regional policy (Poon, 1993) and in the policies of individual operators (Rispoli and Tamma, 1995; Valdani and Guenzi, 1998). Approaches “resources-based” (Dwyer and Kimm, 2003) and “neo-structuralists” (Crouch and Ritchie, 1999; 2003) lead back the competitiveness of a tourist destination not only to structural endowment but also to the skills and synergies that it is able to activate. Furthermore, the literature has focused on the competitiveness of a destination that is the ability to create value for the question of experiential tourism, allowing the tourists themselves to co-create their own experiences (Caroli, 2009). Moreover, the empirical researches have demonstrated that tourism systems, organized following the logic of networks, could more effectively assist firms in

competing and in creating value. Network systems may help tourism firms to enter in new markets, exploit externalities and gain efficiencies in internal and external activities. The participation of SMTE (small and medium tourism enterprises) in tourism networks help them to enhance their ability to promote their structures to individual travellers worldwide, to persuade potential guests to choose and to provide them with unmatched online services (Ndou and Passiante, 2005).

All these highlights the opportunity of an integrated approach for the management of destinations, understood as a bottom-up process allowing to identify collaboratively among the various stakeholders the objectives of development, maintenance and sustainability of the destination (Pilotti *et. al.*, 2013). It follows that the competitiveness of a tourist destination and its ability to attract resources useful at its development depend on the degree of integration between individual territorial components, companies and public institutions. This systemic perspective moves from the hypothesis that firms of a region cooperate and compete in alliance with all the other regional actors to compose the whole regional tourist offer, as systemic solution at the needs of customers (Pencarelli and Forlani, 2002).

However, as argued in previous researches it is compulsory, before enterprising actions for creation of tourism network systems, to undertake a context assessment in order to establish the level of collaboration among firms, the intensity and density of interactions, the social climate, the technological infrastructure and coordination modalities (Ndou and Petti, 2005). Based on this assessment it is then possible to design and plan the best pathway for tourism managers and executives to start creating tourism networks at local or regional level (Ndou and Petti 2005). Framed in the above premises, this paper aims to provide a contextualized model for the development of a regional tourism network in Apulia, a destination of growing and recognized popularity located in the South of Italy. Therefore, the paper is composed of fourth sections, in the first part we present the theoretical background; the second describes the methodology adopted; in the third empirical findings that assess the level and degree of collaboration and integration among the Apulian regional community of actors are presented. The conclusions discuss the main results achieved as well as provide implications and directions for researchers and practitioners for developing a regional tourism system able to compete at international level.

LITERATURE BACKGROUND

Tourism is an important service sector in both developed and developing nations. According to Page and Connell (2009) tourism is one of the most representative dimension of the globalization and there are a lot of contributions in literature that analyze its geographical, ecological, agricultural, urban, managerial, sociological and technological dimensions (Del Vecchio *et. al.*, 2014). Tourism is a service

sector particularly complex, made up of different constituent resources and which depend on an extremely fragmented supply (Ndou, 2011). Like other services, tourism services are intangible, non-storable, customer-specific nature, overlapping of production and consumption, and sensitivity to relationship and reputation (Ndou, 2011). As a service-intense industry, tourism has gone for many decades hand in hand with technology and embraced the potential inherent in its latest developments (Buhalis and Law, 2008). Consequently, technology plays a critical role also for the competitiveness of tourism organizations and destinations (Buhalis 1998, 2003; O'Connor 1999; Sheldon 1997; Poon, 1993).

Information Communication Technologies (ICTs) transformed the tourism sector globally: they have gradually generated a new paradigm-shift, modifying the structure of the industry and developing a whole range of opportunities and challenges (Gretzel, et. al., 2006). Technology is an integral part of tourism and it has transformed the way travel is planned (Buhalis, 2003), business is conducted (Buhalis and Licata, 2002), and the way tourism services and experiences are created and consumed (Stamboulis and Skayannis, 2003). Due at the ICTs, tourists can book all the services for their future journey, with an interesting cost saving, they can realize a virtual pre-tour of the destination selected, they also have the possibility to make decision by learning from the official pages and additional web sources where the tourists' feedbacks and suggestions are available (Del Vecchio *et. al.*, 2014).

A study of the Business Tourism Online (Franchini and Del Forno, 2012) demonstrated that almost 7% of the traffic toward the touristic websites is generated by the social travel platforms (Trivago.com, Tripadvisor.com, Tripwolf.com, Instagram, Facebook.com and Twitter.com). Through these web sites, tourists could know and compare their intentions of trips and journeys, learn from the others tourists, acquire suggestions, feedbacks and recommendation, and share their personal experience after the trip. This highlights the growing importance of the digital tourism as well as the areas of opportunities and threats emerging for the business actors operating in the sector.

A new element of discussion in the current literature refers to the experiential dimension of tourism: during their journeys, tourists are interested in visiting, seeing and living differently from their routines. Those new elements, more and more relevant in terms of experience, add a comprehensive living adventure to the tourists resulting from the visit in a certain area (Pine and Gilmore, 1999) that is composed by a set of services and products with a growing relevance of knowledge (Del Vecchio *et. al.*, 2014). The tourism experience is designed, intentionally produced, organized, foreseen, calculated, priced and charged for them (Pine and Gilmore, 1998) and it is undergoing constant change characterized by the growing importance of consumer involvement, co-creation and the implementation of technology. Neuhofer *et al.* (2013) focused on the "technology enhanced tourism

experiences” as integrative conceptual framework to describe tourism of our days as combination of “experiences, co-creation and technology” (Neuhofer et al., 2013).

Consequently, the tourism destinations should have the ability to create, integrate and deliver tourism experiences, including value added goods and services for tourists (Hong, 2008), implementing new ideas to satisfy and anticipate customer needs (Crotts *et al.*, 2000), combining strategies of differentiation and customization and co-creation. In this perspective, a destination should not be considered as a traditional product, but more as a bundle of tangible (attractions, goods, etc.) and intangible (socio-cultural, services, etc.) components (Morgan et.al., 2004; Pritchard and Morgan, 2001), something that is highly relevant in terms of experience (Govers and Go, 2010).

In an experience-based exchange, the tourist enters into a multifaceted interaction with the regional actors and the setting of a narrative staged by the local community. All the elements recalled impact on the competitive dynamics of tourist destinations that are called to compete by promoting the adoption of a systematic approach. The importance of regional tourism cooperation is commonly agreed and inter-firm networking permits both the flexible integration of tourism system and the growth of the predisposition to innovation at the destination level (Denicolai et al., 2010, Del Chiappa, 2004; Moore, 1996; Nooteboom, 1999).

As for the structural sectorial dimensions and dynamics, tourism continues to be populated by small and medium-sized enterprises (Morrison, 1998; Page et al., 1999; Bastakis et al., 2004, Mastura et. al, 2011), and this implies that the great majority of tourist facilities are conceived and delivered by small and medium-sized businesses (Avcikurt, 2003; OECD, 2008). These dimensions represent a barrier for the competitiveness in the global market due to inadequate human and financial resource, marketing and information technology, and economic scale (Irvine and Anderson, 2004; Jarvis, 2006). A practical strategy to overcome disadvantages related to resource and capabilities is represented by cooperation among tourism firms (Merrifield, 2007; Lu and Beamish, 2001). In OECD countries, tourism development policies strongly emphasize the need for cooperation strategies to enhance competitiveness. Therefore, it could be argued that the competitiveness of tourism sector is highly dependent on the competitiveness of other enterprises and more in general on the competitive ability of socio-economic territorial systems where firms are embedded (Ndou, 2011). Linkages between tourism and local and regional resources, activities, products and communities are key success factors for the development of a integrated tourism system (Bousset et. al., 2007).

Researches indicate that cooperation among tourism firms enables the integration of regional planning policy decisions and the development of regional characteristics, which are positive factors for both tourist destinations and regional growth (Huybers and Bennett, 2003; Baidal, 2004). As argued by

Baggio et al. (2010a) tourism destination may be considered as a cluster of interrelated stakeholders (both public and private) embedded in a social network. This results coherent with the debate on coopetition and companies value networks where performances of firms depend also on the behavior of other companies and vice versa (Freeman 1984; Del Chiappa and Presenza, 2013). In addition, the performance of a tourism destination depends on the connections between the various players and not only on the intrinsic characteristics of the destination (March and Wilkinson, 2009).

The industry needs to be analyzed from an integrated perspective, that is, as a network of tourism supply chains (Ndou, 2011). Therefore, approaching tourism in a systemic and strategic way will be of particular relevance for many social aspects and for the innovativeness of different sectors (Ndou, 2011). Competition in tourism is so a sectorial and regional issue more rather than an individual company's one.

Recently, this has inspired researchers aimed to define tourism as a regional integrated sector with a convergence of a plurality of industries: public institutions, cultural payers, tourism players, agro-food companies, transport and logistics, handicrafts and banks (Del Vecchio *et. al.*, 2014).

Based on these premises and with the aim to understand the path toward the creation of efficient regional tourism systems in Apulia territory, we have undertaken an empirical research to understand the local context in its complexity to establish the level of collaboration among firms, the intensity of their interactions, the social climate, the technological infrastructure and coordination modalities. Afterwards, based on this assessment it is then possible to design and plan the best pathway for tourism managers and executive to start creating tourism networks at local or regional level (Ndou and Petti 2005).

RESEARCH METHODOLOGY

Aimed to contribute at the literature debate on the importance of adopting a systemic approach to sustain the competitiveness of tourist destinations in the current scenario, the study is based on a web survey aimed to assess the degree of collaboration among the community of stakeholders belonging to a tourist destination. The questionnaire survey was carried out in the Apulia region, a destination with a growing popularity in the global scenario, during the period from September to November 2014.

The sample of tourism firms operating in the Apulia Region were obtained firstly by the official Apulian Destination Management System www.viaggiareinpuglia.it and then it was integrated with other information source such as the www.bed-and-breackfast.it, web searches and secondary source (In total the sample obtained was composed of 500 Tourism accommodation firms (hotels and bed and

breakfast, etc.). The Questionnaires were administered online through *Google Drive*. The rate of return obtained was 23%, with 130 questionnaires filled in.

Questionnaire Design

The questionnaire was structured into three parts. The first part dealt with the profile and characteristics of the tourism accommodation firms in terms of typology of business, number of rooms, services offered to tourists, number of presences and nationalities of tourists. The second part contains questions aimed to analyze the strategic organization of the firm and the existence of collaborations with institution and other tourism companies of the territory. The final part refers to the ICTs endowment and social network usage, aimed to comprehend their role on the tourism regional system as well as their contribution to reinforce the systemic management of the destination.

RESEARCH FINDINGS

The analysis of data collected have allowed to define interesting evidences. The results obtained have been synthetized within three main tables that follows. A first result regards the diffused attitude of the Apulian accommodation companies to cooperate with several stakeholders populating the destination, as specified in Table 1 where in line there are the main categories of actors working in partnership with the company and in the column there are the main objectives areas of collaboration.

About the motivation and scope of collaboration, the main reasons identified are the need of a joint promotion/exploitation of tourist offering of the territory with the inclusion of a such large community of actors (23%). Collaborations result mainly with Online Travel Agencies (booking.com, expedia.com, etc.), followed by associations for the promotion and protection of area, public-private consortia or no profit associations. The need of professional training has been identified as the second most important reason behind collaborations; in this case they involve more consortia or associations and public institutions (32%). Although this recognized need of training and life-long learning, there is a negative feedback on the collaborations experimented with universities and training centers (0,48%), while remain higher the interest for initiatives to realized with consortia or associations and public institutions (12%). In relation to the initiatives of collaborations for the creation of an integrated tourist system, the findings show a low propensity of firms to stretch collaborations for this specific scope (11%). Follows the interest for the promotion/ enhancement of tourism vocation of the are (23%). In all cases, Consortia or Associations are identified as the ideal partners for realizing those activities, followed by Online Travel Agencies (booking.com, expedia.com, etc.). In the meantime, rare cases of collaborations with universities and financial institutions have been identified, while are poorly diffused the forms of collaboration with customers, transport companies, car rental and tour operators.

There are no forms of structured collaborations with the agro-food and cultural players. This last negative feedback is surely one of the most significant limitation at the creation of a regional integrated system, mainly in consideration of the nature of Apulia, largely characterized by consolidated gastronomic and cultural heritages.

Type of Stakeholder	Activities											
	Promotion/ Exploitation of the regional tourist offer	Training Activities	Participation at public or private call for funding	Joint services of consulting	Creation of an integrated tourist system	Co-working activities	Co-marketing and co- branding activities	Creation of new tourist product/services	Creation of regional brand	Activities of sensitization to adopt ICTs	TOTAL	TOTAL %
Consortia and Associations of categories	11	16	12	15	10	12	9	9	9	8	111	26,37%
Public Agency for management of tourist destinations	21	6	6	6	14	6	7	11	10	6	93	22,09%

Table 1. *Attitude to the cooperation of enterprises of Apulian hospitality*

About the awareness on the opportunities emerging from the collaboration, it has noted as where forms of collaborations have taken place, there is a positive feedback and awareness about (table 2). In fact data shows as in 84.6% of cases when companies collaborate with others, they acclaimed to benefit from it.

Is the collaboration/integration with other regional partners a benefit for your company?		
No	20	15,4%
Yes	110	84,6%

Table 2. *Apulian Tourist Regional System: Awareness on opportunities of collaboration*

About the lack of cooperation or alliances with agro-food companies, previously recalled, it is important to note that many hotels (27%) retain “strategic” to offer and use local products; this is more valid for hotels and country-houses. Similarly, although there aren’t specific forms of cooperation with customers, all surveyed firms claimed to be particularly careful both in the monitoring of customer reviews on specialized sites such as Tripadvisor, Holidaycheck, Zoover, etc., as well as in implementing customers’ feedbacks and suggestions (especially in the case of villages, camping and cottages). In terms of valorization of the regional cultural heritage, it results to be scarcely implemented (4.88 out of 7), though all companies participating to the survey have expressed interest in starting relationships

with organizations that deal with the promotion of the regional cultural heritage. In terms of strategic and organizational configuration, the analysis of the opportunities for creating new entrepreneurial ventures starting from the valorization of natural and environmental resources, the survey demonstrated as tourist operators are aware about their potentialities and their value for consolidating the image of the regional destination (the average marks are between 6.53 and 6.38 on 7).

The table 3 illustrates the source of revenues of the firms (Question: On a scale from 1 to 7, where 1 means "not at all" and 7 means "a great deal", to what extent his company benefits from the offer of the following products / services?). The companies interviewed have identified almost exclusively the sale of the rooms as their main source of revenues. The second most important source is the food, especially for hotels of larger size, where it can be identified an extension of the core business related to the sales of rooms. In second stage, the sale of foods and wines is an additional source of revenues for these structures. The analysis highlights two further negative evidences:

- the first one related to the transport and logistic services. While it is largely diffused the strategy of transport companies to enlarge their business by including the sales of additional services (hotels, cars, tickets, etc) the companies interviewed result not interested in persecuting a strategy of vertical integration (47% of the sample have expressed the lowest interest for this additional source of revenue);
- the second is about tours and guided visits, that are not considered as source of profits for interviewed. In highlighting the scarce awareness of the potential contribution of cultural heritage at the qualification of the single and regional tourism offering, this result provide the image of a form of tourism still "wide", that leaves tourists free to discovery by themselves of the region.

Items	Score							Average
	1	2	3	4	5	6	7	
Rooms	0	2	2	5	12	20	89	6,41

Table 3. *Apulian Tourist Regional System: Sources of Revenues*

Moreover, a cluster analysis has been performed in order to highlight the presence of groups of companies not interested into the enlargement of their areas of business, together with companies interested only in some specific activities, and others that are committed with a more diffuse enlargement.

Given the low number of responses collected from the Apulian accommodations participating in the survey, there has not been necessary to provide collateral inferential analysis, even if it is reasonable to suppose that an expansion of the results of the cluster analysis to the population would be obtained interesting implications.

The largest number of companies interviewed (63% of them) have not shown any interest in the enlargement of their business to business areas complementary or parallel to the sale of rooms (cluster 3). About 22% of the sample is very disposed to expand their business with services as catering, sales of regional foods and wines. This result is in line with the findings of the entire discussion. About 13% of the structures resulted quite interested (6 out of 7 votes) to catering services and the exploitation of advanced technological services. This cluster may possible to identify strategic visions and potential of growth.

Table 4. *Apulian Tourist Regional System: Cluster analysis on the economic advantage coming from collaboration*

DISCUSSION AND CONCLUSION

The context analysis performed for the tourism system in Apulia region evidences a local tourism supply system that is very fragmented, with a relatively low level of cooperation, low level of adoption of innovative and value added competitive approaches and models. Such results suggest the necessity

of activating solutions that seek to create a culture of collaboration, increase dynamic interaction between diverse participants and to create new skills and capabilities to cope with a complex new environment. This is expected to impact positively on those companies that have just started to work for the creation of systemic regional offering and it could also activate a virtuous mechanism of sensitization on that large number of companies lowly interested and aware about this opportunity. Looking at the emerging dynamics characterizing tourism as knowledge-intensive and experiential sector more and more enhanced by the diffusion of ICTs, the importance of investing in the creation of a regional integrated system of actors arises as a mandatory choice. At this purpose, a first stage is to start involving operators, particularly those aware and interested, around an innovative solution that brings together in an integrated and collaborative frame the different actors of the tourism supplier to publish, promote and market easily and “seamlessly” their products and services. As the cluster analysis indicates, in the specific case, there is a group of firms that are more prone on collaborating and adopting new technologies and business models. Therefore, it could be more efficient to start with creating a seamless travel tourist experience by blending together the supply offer of this first group of supplier. The effects and benefits reaped by them will, then, drive the path toward the enlargement of the collaborations to other local actors, tourism and non-tourism firms. The creation of a territorial tourism system will add value to the region through an integrated qualitative supply for tourists and through serving autonomous operators with strategic services and tools that they are not able to develop singularly. However, an awareness phase is compulsory in order to build and increase local tourism capabilities regarding the importance of integrated and experiential tourism systems. In particular actions should be oriented towards making local tourism operators aware of two main things: the need to cooperate for developing comprehensive propositions that can attract tourists to the destination, and the opportunities that technology can provide for the creation of regional tourism systems. It is worth to note that, the creation of regional tourism system should be strongly based on collaboration and partnership between and among different players, tourism/non-tourism organizations, and it provides comprehensive, qualitative, integrated, specialized services, information and products (Ndou, 2014).

Nevertheless, any solution, no matter how simple, will not automatically be adopted if not framed in a wider awareness initiative aimed at informing the relevant stakeholders of the impacts and benefits that it can have for them over the short and the medium-long term.

At this purpose the active involvement of public agencies and institutional actors could allow to overcome the lack of collaboration registered; it could result useful in balancing the different interests emerging within the large set of companies and industries interested by tourism.

Another, important feature for an effective tourism regional systems is the range of activities, services and information necessary for tourists before its journey in the place in addition to a wide number of value added services, personalized and customized. Furthermore the management and development of an innovative tourism systems involves integrating a mixture of skills and network interdependency which allow the knowledge sharing and creation, use of core competencies of each networking group as well as more efficiency in tasks' handling.

ACKNOWLEDGMENTS

This paper provides a contribution to the research related to an on-going research project Puglia@service leaded by the Apulia regional technological district D.HI.TECH and funded by the Italian Ministry of Education and Research (MIUR).

DISABILITY STAKEHOLDERS. CONSIDERATIONS FROM ITALIAN CONTEXT

Migliaccio, Guido

Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Italy

ABSTRACT

Ordinary business logic could potentially lead to a bias against disability stakeholders if they are merely perceived as factors affecting productivity. A more balanced assessment should take into account both tangible and intangible effects on the business system in which disabled people may have stakeholder roles.

Relations with disabled customers/users or suppliers who require special aids are complex.

Disabled employees certainly have a greater impact in terms of structural requirements, training, prevention and healthcare, not to mention the operational discontinuities that any form of disability is likely to cause. Disability, however, could contribute towards the creation of a stimulating, motivating and empowering working environment, this way maximizing the overall result.

Diversity management and, above all, disability management increase overall productivity, also because they tend to boost tolerance with positive effects in terms of reputation. Financial benefits deriving from central and local government grants often compensate for the expenses the company may incur.

The beneficial impact on the economic system is also often overlooked: otherwise unproductive resources are brought back into use, this way freeing productive energies within families with disabled members.

Disabled stakeholders who are customers or users represent a substantial and growing target for companies producing specific goods and services, tailoring their strategies to demand.

Disabled people are therefore seen as useful economic players, regardless of any other ethical consideration which, on the basis of the principle of universal destination of resources, could only reaffirm the subordination of the economy to life values, always, anywhere and in any case.

Keywords: *Disability Stakeholders; Disability Management; Diversity Management; Inclusive Society; Handicap.*

DISABILITY AND THE ECONOMY: INTRODUCTORY PROPOSITIONS

It seems at first that a 'handicapped' input can only be accepted if the reduced productivity is somehow compensated by economies related to the 'acquisition' or the 'employment' of the factor itself. There could therefore be room for a bias against disabled people, in terms of their participation in the economic process, as long as disability affects their productivity.

The assessment regarding the economic feasibility of the disabled productive input should however be formulated within a broader analytical framework, considering the effects throughout both the business system and the wider economic and social context in which the resource is employed. The analysis should therefore be carried out according to different perspectives: corporate and macroeconomic, but also on an ethical/economic and social scale.

AIMS AND STRUCTURE OF THE PAPER

This paper wants to answer some questions:

- Does a strict application of economic logic exclude the notion of 'limited' resources?
- Do 'handicapped' productive inputs affect efficiency and effectiveness of production?
- Can diversity and disability management help to create an inclusive society?

This contribution therefore would demonstrate that disability management promotes a new vision of disability in society and especially in the economy. In particular, the objectives of this paper are:

- to spread the diversity and disability management;
- to encourage ethical values to build participatory and inclusive society and economy in which everyone can play a productive role;
- to facilitate this process by switching diversity and disability management.

In the beginning part, the paper discusses literature review. Subsequently, it emphasizes effects of disability on business viability: disabled stakeholder are employee or business operative, and customers or users. The paper discusses also effects of disability beyond corporate level and in the general economic system. In the last part there are some notes about ethical and socio-economic issues. Finally, the paper will reach a successful conclusion: despite hard-to-die prejudices, disability does not necessarily lead to corporate diseconomies.

RESEARCH APPROACH

Objectives of the paper will be achieved with some theoretical considerations based on a qualitative approach with an updated conceptualization of Italian literature review.

This paper, therefore, does not propose the results of a specific research, but wants to propose a number of critical considerations taking into account the latest developments, described by the best Italian bibliography. It has an interdisciplinary value because it originates from the combination of general economic, managerial, ethical etc. aspects.

LITERATURE REVIEW (NOTES)

It is very difficult to propose a comprehensive literature review in a few pages. The theme is interdisciplinary and can be approached in different perspectives.

By analysing the most recent international contributions, there are a lot of papers about ICT (Information and Communication Technology) functions (Govardhan et al., Eds, 2015; Garbutt and Kyobe, 2013; Bocconi and Ott, 2013; Mach-Król et al., 2015). With ICT, lives of people with disabilities can be improved. ICT can help people with disabilities in education, training and cultural development and promotes also the employment of people with disabilities. ICT can, however, also create new disability because not all people know how to use technologies that change constantly (digital divide) (Pick and Nishida, 2015; Masini et al., 2011; Tarallo, 2003; Anzera and Comunello, 2005; Bauerlein, 2011; Parks, 2012).

About disabled stakeholder as employee or business operative, and customers or users you can read: Oberfield, 2014; Burns et al, 2014; Sabharwal, 2014; Janssens and Zanoni, 2014; O'Brien, 2013; Scarpat, 1984 and Scarpat (Ed.), 1987; Migliaccio, 2015; Metallo et al. (Eds.), 2009. Some Italian studies highlight the economic impact of disability on the system, emphasizing the costs to the community, but also the benefits (Migliaccio, 2009 and 2015; Metallo et al., 2009). O'Brien (2013) demonstrates instead, that macroeconomic conditions may influence disability.

There are also specialist studies related to specific industrial sectors, such as the green economy and job creation for disabled people (Bruyère and Filiberto, 2013).

There are, finally, studies on the relationship between disability and economy of individual Nations or particular geographic areas (Mehrotra, 2013; Twigg, 2005; Shang, 2000).

The international literature is therefore rich in many specialized contributions. Interdisciplinary works that mix the different perspectives are rare: this paper offers a summary of this type providing a brief overview of the whole topic, focusing on the relationships between disability and economy. It is based primarily on the best Italian literature: interesting Italian papers will be mentioned later.

EFFECTS OF DISABILITY ON BUSINESS VIABILITY

Disabled people, taken either individually or in groups, can virtually play any stakeholder role: capitalists, lenders, investors, customers/users, suppliers, opinion makers, employees or business

operatives (Migliaccio, 2009, p. 202 and ss.).

In many cases the handicap is unrelated to the task performed.

One might think, for instance, of a mere disabled lender, of an investor or a shareholder who takes little part in the governance of the company, and so on. In these cases disability would have a negligible effect on the operation of the company, limited to those rare occasions in which the disabled and the organization get in touch. The latter should therefore only facilitate communication and remuneration processes and, in a wider sense, the exercise of rights related to the role of provider of either borrowed or own capital.

The relationship between the company and the disabled person becomes more complicated, however, if the latter is an employee, a business operative or a customer/user.

Those cases should be more closely examined.

The disabled stakeholder as an employee or business operative

Disability, in this case, could have a significant effect on corporate organization¹.

Constant participation in the productive activity is probably the trickiest option, if one considers the costs associated to it.

First of all, there is the investment in appropriate facilities in order to overcome obstacles to effective participation. That is not always offset by an innovation-bound production culture, that could actually benefit any technological facility, preventing obsolescence and potential diseconomies. Training and updating policies could become more complex and expensive, and therefore not always viable. Also to be considered are healthcare needs related both to prevention and assistance, not to mention a higher amount of sick leave due to the disability itself and often regulated by law. Opportunities arising from disabled employees seem to be often overlooked, but are nonetheless significant and often able to compensate for the above mentioned additional costs. Those opportunities are analysed through the conceptual framework of the diversity management (Cuomo and Mapelli, 2007; Mauri and Visconti (Eds.), 2004; Padua, 2007) and its derivative, the disability management (D'Amato, 2009, p. 229 and ss.; Angeloni, 2010, p. 215 and ss.).

The first introduced a new notion of diversity, which is no longer considered a threat due to the conflicts it may cause, but it is instead viewed as a stimulus towards the enrichment of the working

¹ The Ibm and Asphi Foundations launched a special study programme about the integration of disabled people, providing useful recommendations about the subject. The research led to the publication of a set of guidelines, which are available for consultation (Fondazione Ibm, Fondazione Asphi Onlus, 2007).

environment and the overall increase in productivity, thanks to the tolerance and respect existing among the different players involved.

Greater attention to human resources, regardless of their features, leads to a creative, motivating and empowering environment, this way maximizing the overall result.

Intentionally pursued by the company, diversity management has become necessary when the workforce are multiethnic, and the amalgamation multicultural.

An embracing attitude, willingness to listen and appreciation of diversity, when shared and accepted, should improve business performance and promote corporate reputation, consolidating its social legitimacy.

Of course the assimilation process will not be instantaneous, having to overcome initial prejudices and disruption, with potential damage to internal and external relations.

While valuing diversity, disability management deals in particular with disabled people, and of course with the prevention of accidents which could cause disabilities and have financial consequences for the company involved (compensation, replacement of the injured employee(s) with consequent loss of skills already acquired, etc).

Several areas of potential intervention can be identified, all starting with an analysis of structural and organizational corporate features, and of the disabilities carried by the stakeholders involved. It is likely that its implementation should first go through a review of the values and culture affecting the management style and the existing human relations.

It also deals with the 'workplace' analysis – both of the physical space and of the set of tasks to be performed - with relation to the disabled person.

The first point is related to the removal of architectural barriers through the design of structures and tools suitable to the disabled person's needs: technological evolution, with particular emphasis on IT and telecommunications, allows now adjustments which were unthinkable only a short while ago (Festa, 2009, p. 287 and ss.).

Also important is the job analysis, in order to determine if the tasks considered are suitable to perform for the disabled person in question.

Disability management also deals with the different arrangements regarding the tasks to be performed, taking into account flexible hours, redistribution of job titles, training, etc.

Discrimination and prejudice both during the selection process and at work are to be overcome.

In the first case current rules and regulations, but also a biased psychological approach, may discriminate between disabled and able-bodied people, creating understandable friction.

Disabled people's apprenticeship might then need specific procedures.

The disability manager should also assess the disabled employee's status within the company and

especially his/her contribution to the production process (Colella and Varma, 1999, p. 79 and ss.), in order to avoid bias in the award of promotions, as the most sought-after positions are sometimes primarily reserved to the able-bodied. He will also seek to level the perception of disability within the company, whereas the physical handicap is often more easily accepted than the psychological one.

Generally speaking, any assessment of productivity could be affected by the type of disability and its visibility, by the origin of the disability itself (either genetic or accidental), by the possibility of reversing the problem and by its impact on social relations¹.

Any measurement of productivity regarding disabled people should also consider contributions and public funding that compensate the company for either expenses or lost opportunities, this way boosting the economic and financial dynamic.

Finally, in many countries the employment of disabled people is, in certain circumstances, required by law: abiding represents a civic duty and prevents penalties.

Disability stakeholders as customers or users

Despite the difficulties in listing, counting and classifying disabled people (Lucadamo and Simonetti, 2009, p. 137 and ss.), it is clear that the advancement of medical science and life elongation have made the disabled more numerous and varied. In Europe approximately 10% of population can be considered as bearing some sort of disability: that is a significant market target for many companies (Metallo et al., 2009, p. 325 and ss.). Rough data should however be disaggregated because it includes quite different aspects. Besides any quantitative remark, companies' attention also stems from the social and cultural dynamic: the disabled are now not only socially active and aware of economic issues, but also make the able-bodied judge companies according to their policies on disabilities.

Disabled stakeholders are therefore influential opinion makers: on their own, best if associated, they are citizens and voters, involved in social initiatives or directly in politics, their opinions influence policies and trends.

Their needs and desires, once only latent, are now well-known and openly proclaimed.

This context favours an increasing attention towards the disabled, however heterogeneous their presence in all socio-economic groups might be.

This requires specific segmentation techniques that could also take into account the families of the disabled, as they often affect their choices. Typical features of a market segment (measurability, accessibility, relevance, profitability) are all present here to consider the disabled as a group requiring specific marketing strategies and policies.

¹ The disabled, unlike the able-bodied, often do not have role models to look at.

The following are key factors to be considered in order to make the right choices:

- the loyalty of disabled customers/users towards companies that show constant attention to their needs;
- how choices made by able-bodied people are affected by their interest in the disabled;
- how the analysis of disabled people's needs and requirements could also have beneficial effects on products not specifically designed for the disabled.

Marketing mix policies should therefore be specifically tailored.

The product may, for instance, require specific adjustments for it to be used in the context analysed. In other cases, for certain disabilities, it is necessary to design specific products, which are quite different from those already in use. Accessibility and usability should be paramount in goods and services made for the disabled, either tangible or intangible.

The price is often determined after the application of a substantial margin, which in many cases is considerably higher than the additional costs associated with design and manufacture. Demand is in fact quite rigid due to lack of substitutes, and also because thanks to them the disabled can often address significant problems in their lives.

Users, on the other hand, often benefit from tax breaks that offset higher costs.

All these factors concur to make possible for the company to fix a premium price for products aimed at the disabled. On the other hand, the company should not give the impression of exploiting other people's weaknesses.

Revenues may also increase due to sponsorship, public grants, tax breaks etc.

Current advertising trends advocate the presence of disabled people in ads, as that supports the image of a company which is sensitive to the issue and is close to families affected by disabilities. Web communication and e-commerce have adapted accordingly, particularly through the set up of user-friendly websites. It is easy to find plenty of examples of disabled-friendly communication in day-to-day life: subtitled television programmes, lift buttons and public telephones using the Braille system, etc.

Sponsoring conferences and initiatives aimed at disabled people could also boost the company's reputation.

The ads, as well as dealing with emotional and sensitive issues, should be able to illustrate specific features of the goods and services being advertised and to balance the use of technicalities with the desire of the disabled to feel like ordinary consumers. At the same time, communication should avoid giving any hint, however veiled, of segregation or the impression to exploit the disability only to maximize profits.

Tact, respect, sensitivity, combined with professionalism, will be needed.

Selective distribution, typical of goods with a high added value, may cause discomfort to people with disabilities, especially to reach the facility providing the goods/services they need. Special corners in shopping malls seem a better solution, as they can also promote integration. The store should be devoid of architectural barriers and the staff should be able to tailor the product or service offered to the customer's needs. The staff involved should display not only technical competence and expertise, but also sensitivity and willingness to listen: for this reason a significant investment in training will be needed.

Besides political and strategic considerations arising from a new notion of the disabled as business customers or users, one can identify some sectors of the economy in which disabled people consistently produce specific instances.

Rehabilitation. It includes all actions aimed at restoring physical, emotional and functional qualities of a disabled person (Oliva, 2009, p. 376 and ss.). It could be either clinical or social.

The first one includes both diagnostic and therapeutic interventions, while the other one is about any action aimed at ensuring full participation of the disabled person in social life.

Rehabilitating is therefore essentially about healing, as much as possible, and above all about embracing the disabled, taking into account one's limits and potential.

The rehabilitation sector is often affected by the availability of public resources and can be either run by the State or by private contractors.

Furniture. New technologies, particularly those related to IT, telecommunications and electronics have been also applied to the domestic environment, increasing safety and energy savings, and above all introducing new forms of automation to the benefit of disabled people (Rossetti, 2009, p. 381 and ss.). Home automation is attentive to the needs of the disabled, contributing to the simplification of many of the tasks usually performed at home.

Barriers being overcome, customized equipment for the disabled and their families, furniture and appliances whose use has been simplified and made accessible to disabled people, are just some examples.

Transportation. Several national and international legislative sources call for policies facilitating the mobility of disabled people. Transport is in fact considered one of the keys to integration, allowing the disabled to reach places of study, work, socialization and specialized care (Serluca, 2009, p. 392 and ss.). It is now possible to purchase cars specially adapted to meet the whole range of disabled people's needs. Buses, trains, planes and ships are now designed to facilitate access to the disabled (either motorial, blind or deaf) and are also able to guarantee certain standards of assistance on board.

Tourism. In recent years, the disabled person has been considered a 'tourist with special needs' (Lurgi, 2009, p. 406 and ss.; Gallucci and Marino, 2009, p. 449 and ss.; Migliaccio, 2015). A large market

providing leisure and rest activities is now opened. This has led hotel facilities to adapt to the new needs through ad hoc investments and special entertainment programmes.

IT. Possibly the sector most affected by recent changes, whereas many specific aids can meet different needs, bringing to light the potential previously overshadowed by the handicap.

The products one could use for this purpose are many (Migliaccio, 2014).

Also to be mentioned are the substantial investments made to promote education and social integration among disabled students, starting from their childhood; to allow them access to museums, libraries and archives, and to produce books in electronic format that could be used by people with particular disabilities; to promote sports activities among the disabled, some of whom are excellent athletes who take part in competitions specially arranged for them.

EFFECTS OF DISABILITY BEYOND CORPORATE LEVEL AND IN THE GENERAL ECONOMIC SYSTEM

In the occurrence that a disabled person cannot fill any position in a company, due to high costs not adequately balanced by the potential benefits outlined above, one should try to find out whether the socio-economic system, which includes our hypothetical company, still considers the employment of the disabled person in question something worth pursuing. A business group, for instance, could intervene through beneficial synergies in favour of a controlled company, sometimes only to boost the group's image and reputation.

If we consider things in a general perspective, we can say that the burdens placed on society should be balanced by the benefits coming from a successful integration of the disabled into the production cycle. Public spending usually covers fixed costs related to disabled people of all sorts: hospitalization, tackling diseases (using drugs, prostheses, and rehabilitative assistance), education and training (for support teachers, specific educational technologies), public infrastructure projects designed and built to improve accessibility, etc.

Finally, it is worth thinking at the distortions deriving from the application of legislation aimed at facilitating the employment of disabled people: this could lead to the paradox that disabled resources might be used more than 'healthy' ones ... Indeed, even if one goes beyond corporate level, considering the general economic system, the employment of disabled people in the production cycle could be beneficial (Pizzuto, 1987; Scagni, 1987).

First of all, it brings back into use resources which otherwise would remain unproductive and therefore constitute a financial burden for the community. This will in turn increase overall productivity. The employment of the disabled releases members of their families, who would

otherwise be almost exclusively devoted to their care: families' work should be therefore included in calculations regarding the general economic system.

Individual and family incomes will increase, boosting the demand of goods and services. Triggering a virtuous circle will also bring an increase in tax revenues.

A disabled person who is also committed and motivated faces a lower risk of further illness, and could therefore contribute towards the reduction of public spending. The disabled, their families and all those directly and indirectly involved with them affect, through their investment and consumption choices, general economic trends, also because disability enhances the use of 'relational' goods rather than that of 'positional' ones. These are part of the traditional, one-way bargain: there is an offer of goods to be eventually accepted.

'Relational' goods, on the other hand, follow the principle of reciprocity, meaning that they are considered useful if enjoyed together (Bruni and Zamagni, 2004, p. 22; p. 161 and ss).

Goods that only meet material needs are therefore not enough. One also needs to establish genuine relationships with other people. Transfers of relational goods depend therefore on human relationships and on people who create them.

Taking care of relational issues should therefore be viewed not only as another commitment the community takes towards its members, but also as a potential motivational resource.

A trading economy, for instance, offers one-way rated services to disabled people in need, while in a relational economy there is a reciprocal exchange, with completely different motives, between the social worker and the disabled.

The civil economy, the non-profit and the third sector can therefore coexist with standard markets, which might be efficient but are at times unfair.

ETHICAL AND SOCIO-ECONOMIC ISSUES ABOUT DISABILITY

The economic dynamic faces limitations imposed by common ethical principles which sometimes are a compromise between the demands of different races, cultures and religions living together. However, the notion that man's main purpose is the conservation and the harmonious development of all his faculties, from generation to generation, using all available resources, seems to be commonly acknowledged (Alford et al., 2010; Guzzetti, 1987, p. 9 and ss.). It is therefore unacceptable any use of resources which tends to exclude others, especially if they bear some sort of disability. The economic system should therefore facilitate the access to available resources for everyone, even if disabled, for the development of individual and social values which are at any time unquestioned in one's life, from conception to natural end, regardless of one's contribution to the production cycle.

Consumerism, technological progress, frantic innovation, pronounced territorial inequalities, globalization, self-regulating markets are all factors potentially operating in the opposite direction. Vigilant participation on all citizens' part will therefore be needed.

The promotion of consumption patterns which respect the environment and favour distributive equality can only be achieved, however, within a cultural framework that places solidarity before utilitarianism and fairness before efficiency.

Economic ethics still lay the foundations of social legitimacy for companies, ruling out any form of production aimed at meeting illegal or morally/socially unacceptable demands. They do not condemn profit though, which is the necessary return for the entrepreneur. Ethical choices made by the management shape corporate values, particularly regarding the competitive, social and economic dimension of the company, which are seen as intertwined, and assimilated as such into the organizational fabric of the company itself (Ricci, 2004, p. 9 and ss.). Its role also has ethic and social implications: the durability that may increase and develop, the progress and evolution of the sector and area of operation, the enhancement and reward of the resources employed etc. One could also mention environmental issues, the protection of cultural heritage, any relation entertained with minorities, the local community and all external stakeholders, transparency in communication and fairness in competition.

Finally, there is the broad topic of industrial relations: hiring and dismissing employees, placement of recovering workers, proper working conditions, adequate remuneration, freedom of speech, trade unions, etc.

The topic of industrial relations also includes, of course, the employment of disabled personnel in the production process.

It seems like almost all areas of business management could be imbued with ethics, which strongly affects business choices.

This is not necessarily synonymous, however, with lost opportunities or internal and external diseconomies.

Ethics can contribute towards sustainable corporate development, creation of value (Angeloni, 2010, p. 186 and ss.), and can also generate useful competitive advantage¹.

Among the benefits of correct choices are: a safe and engaging work environment, that attracts and retains qualified staff; establishment of long-term relationships with customers; an excellent reputation; improved relations with financial institutions etc.

That means we are not just being sentimental: ethics can and should influence strategies, help meeting targets, increase profitability (Coda, 1992, p. 12 and ss.)¹.

¹ There are many cases of high ethic-high profit companies.

CONCLUSIONS

Despite hard-to-die prejudices, disability does not necessarily lead to corporate diseconomies.

Potential additional costs resulting from structural adjustments or cultural changes are often offset by significant gains and/or public intervention.

But even if the economic situation of single entities calls for the exclusion of disabled people from the production cycle, assessments based on a wider perspective could favour the adoption of compensatory measures. Ethics further endorse this perspectives.

It should be noticed that in our paper the economic analysis has preceded the ethical one, which in most cases has merely confirmed what already ascertained through the utilitarian approach.

That in order to avoid the pathetic deviation, although morally and emotionally convincing.

Ethics should primarily take care of those few cases whose disabilities are so serious to prevent them from working altogether.

They can still play economically important roles which are unaffected by their physical condition (investors, lenders, opinion makers etc), but above all they buy certain goods and use specific services that sustain market demand. Even in this hypothesis, however marginal, we should not only consider the costs associated to it, but also the benefits for the suppliers and the redistributive effects of social spending. If the overall balance is still negative, ethics should eventually prevail over mere economic logic, reaffirming subordination of the economy to life values always, anywhere and in any case.

IMPLEMENTING SUSTAINABILITY IN WINERIES: ISSUES FROM AN ITALIAN CASE STUDY

Moggi, Sara; Campedelli, Bettina; Leardini, Chiara

Department of Business Administration, University of Verona, Verona, Italy

ABSTRACT

This paper aims to investigate sustainability issues in wineries by analysing the drivers that suggest the consideration of this concept in the day-to-day activities and main barriers to the process of improving sustainable practices in the winery sector. A literature review on the topic and a qualitative, in-depth explorative case study are presented. The choice of the case, Ripasso, was driven by its nature as a cooperative winery and its participation in Magis, an Italian project on sustainability. The article presents levers and problems to consider in the introduction of a protocol that aims to improve the quality of the grapes harvested and environmental biodiversity, reducing impacts of the production in terms of several aspects, such as water consumption and fertilizer use. A future research agenda is outlined, based on the literature gap and the main points provided by this study.

Keywords: *measurement, barriers, reporting, certification, Italy, wine*

INTRODUCTION

In recent years, the increasing focus on sustainability in agriculture, particularly in the winery sector, has been driven by several reasons. The heightened interest in this practice is demonstrated by a large number of academic publications that consider the various degrees of sustainability applied in the winery sector. This attention could be considered as a consequence of consumers' behaviour that, according with Renton *et al.* (2002), is demonstrating a growing interest in environment-friendly products and of managers who follow market requests and are motivated by a strong belief in sustainable practices. Understanding the new consumer needs, these leaders are the formers of organizational change—from the cultivation of grapes to the delivery of the bottle—comprehending that with sustainable production, the efficiency of their enterprise will also improve.

Casini *et al.* (2011) separate the research on sustainability in the winery sector into two main streams. The first focuses on the attitude of the enterprise toward sustainability in terms of the management approach and behavior of a single person in the organization. The second stream considers the

importance of sustainability in the definition of strategies and long-term plans. Both groups of studies usually overlap, and the consideration of one point of view does not exclude the other. In light of this, our study can be considered into the first stream and overlapping partially the second.

As noted by Isaak (2002), firms can approach sustainability at two different times of their existence. In a 'green business,' managers discover the importance of 'greening' their behaviour during the life span of the organization, where costs and innovations are part of marketing advantages and usually do not involve an ethical argument. On the other hand, a 'green-green business' designs its practices to be green from the beginning, as a start-up company. These organizations aim to apply sustainability to processes and products for the purpose of socially transforming their host sector "towards a model of sustainable development" (Isaak, 2002, p. 82).

Despite the increasing number of studies on this topic, scant is known about the drivers of sustainability development in Italian wineries. From the understanding of sustainability dimensions to the measurement of these improvements' effects on production, there is a lack of in-depth research to analyze the numerous aspects of sustainability in Italian wineries (Santini *et al.*, 2013).

Given the general literature gap in wineries' sustainability in the Italian context, we conducted an explorative case study analysis by considering a best practice in implementing sustainability. Driven by its certification on sustainability, the Ripasso cooperative enterprise under study has implemented changes in several aspects of its production. Through this analysis, the study aims to provide a better understanding of the drivers that guide wineries toward a more sustainable production and the barriers to this virtuous process.

The following section summarizes the meaning of sustainable practices in the winery sector. It reviews the literature that considers these aspects from several perspectives, such as the definition of the boundaries that entrepreneurs have to consider in defining strategies and actions to transform the implementation of sustainable practices. The methodology section describes the research steps followed, while the case study section explains the results of the analysis of a specific reality. Finally, the conclusions provide main implications of our study for future research.

SUSTAINABLE DEVELOPMENT AND SUSTAINABILITY IN WINERIES

Due to years of indiscriminate use of natural resources, environmental preservation should be taken into account, moving from a short-term to a long-term view. According to Bastianoni *et al.* (2001), "currently natural resources are consumed at a rate, which is higher than the rate at which they are

replenished. In order to avoid a depletion of natural resources and a subsequent loss of well-being in the long term, consumption rates must be reduced.”

Economic development, as well as public policy decisions, should be based on the idea of sustainable development (SD). A widely recognized definition of SD is given in the Brundtland Commission Report, *Our Common Future*: “Sustainable development seeks to meet the needs and aspirations of the present without compromising the ability to meet those of the future” (World Commission on Environment and Development, 1987, p. 151).

Various meanings of SD have considered several impacts that organizations can wreak on the environment in which they operate. Because the environment comprises a complex mix of nature, networks, and people, it can be influenced by a number of actions and practices carried out by a single subject, a group of people, and organizations.

Ohmart (2008a, p. 143) reports the California Association of Winegrape Growers and the Wine Institute’s definition of sustainable agriculture as “growing and winemaking practices that are sensitive to the environment (environmentally sound), responsible to the needs and interests of society-at-large (socially equitable), and economically feasible to implement and maintain (economically feasible).” As noted by the author, the farm is influenced by the interests of several subjects that could be involved in its activities from numerous points of view. In accordance with Tee *et al.* (2007) and Gabzdylova *et al.*, (2009), the firm approach to sustainability depends on the various influences coming from several stakeholders and on the resources investable for sustainability. This approach is first, a consequence of external and not manageable forces and second, the result of decision-making processes of the managers of the firm or a personal interest of the entrepreneur (Tee *et al.*, 2007). As noted by Marshall *et al.* (2005), this last subject plays a pivotal role as the former of the process of development in her/his firm. This person’s approach to sustainability is a consequence of personal knowledge, experiences, and the belief that actions toward SD generate a positive return in terms of value creation (Schaltegger, 2002).

Considered a managerial approach, enhancing sustainability also means measuring it with the aim of understanding if any change in the firm performance is a consequence of this virtuous behaviour and a positive effect on corporate image and reputation (Gabzdylova *et al.*, 2009). As underlined by Ohmart (2008a), the increasing interest in sustainability in the winery sector faces three main challenges: (1) defining the meaning of sustainability in this specific industry, (2) implementing it in the vineyard, and (3) measuring the effects of its implementation process. Measurements of sustainable aspects can be

applied in all the parts of the value chain from the inputs selection to the production transportation and the waste production.

Despite numerous studies on sustainability implementation in wineries, there is no recognized definition of sustainability in this sector. In this regard, several initiatives have arisen to identify sustainability issues and to promote practices and actions in these terms. As highlighted by Klohr *et al.* (2013), no common standard can be considered that comprehensively covers several aspects of sustainability in wineries. Nonetheless, these authors' study on six implementation programs proposes a common understanding of the meaning of sustainability in action, emphasizing the development of these practices by considering the three dimensions of sustainability: economic, social and environmental impacts of the activities.

According to Elkington (1997), the identification of sustainability dimensions should consider the triple bottom performance (economic, social, and environmental impacts). As underlined by the internationally recognized Global Reporting Initiative (GRI) guidelines, measuring sustainability means implementing a number of indicators built on the three dimensions presented in sustainability reports. Despite the completeness of the last version of the GRI framework (G4) published in 2013, a supplementary sector that supports the peculiarity of the agriculture sector still does not exist. Due to the lack of a widely recognized, international framework on sustainability measurement in the agriculture sector, particularly in wineries, several initiatives have proposed the evaluation of different aspects of sustainability, such as the tools for carbon footprint measurement (Pulselli *et al.*, 2008), which have drawn much attention.

Other points under discussion are which dimensions of economic, social, and environmental impacts are usually considered and which stages of wine production should be evaluated in terms of sustainability costs and performance. Several case studies on best practices have proposed insights from different perspectives, such as environmental drivers and impacts (Marchettini *et al.*, 2003; Marshall *et al.*, 2005; Pulselli *et al.*, 2008), competitive advantage (Atkin *et al.*, 2012; Flint and Golicic, 2009), and environmental management tools for the entire chain (Hughey *et al.*, 2005; Ardente *et al.*, 2006; Ohmart, 2008b; Forbes and De Silva, 2012). However, knowledge remains limited about the drivers of Italian wineries' sustainability implementation and the barriers to its path, and there is a call for further studies on issues regarding practices, particularly performance measurement (Casini *et al.*, 2011). With the aim to contribute in filling this gap, this article presents an explorative case study analysis on a particular cooperative distinguished for its keen attention to sustainable production and tangible interest in the governance of sustainable issues.

METHODOLOGY

With the aim of identifying the features of sustainability implementation, drivers of this process, and barriers that render these actions difficult, our research was based on an in-depth analysis of a case study, hereafter called “Ripasso,” that we identified as performing best practices in terms of sustainable behaviours. To answer our research questions through the case study (Patton, 2002), a qualitative approach was employed (Creswell, 2007) to observe actions and facts in their natural conditions (Yin, 2009).

The case was selected as a best practice due to the involvement of the cooperative in Magis, a sustainability project promoted by BayerCrop Science, which promotes low-impact wine production. We identified Ripasso as an excellence-seeking cooperative comprising 106 firms, using Gabzdylova *et al.*'s (2009) matrix that classifies firms according to their extent of corporate social responsibility (CSR) and drivers of CSR.

Extent of corporate social responsibility (CSR)	Enhanced	Reputation seeking	Excellence seeking
	Limited	Minimalist	Value driven
		Compliance	Volunteerism
		Drivers of CSR	

Figure 6. *Matrix of sustainability orientation, adapted from Gabzdylova et al. (2009).*

Gabzdylova *et al.* (2009) categorize the four main groups of firms as minimalist, value driven, reputation seeking, and excellence seeking. The firms classified as minimalist consider sustainability issues only in relation to compliance with the standards sector or national or regional laws, and they do not invest in sustainability improvement beyond the legal requirements. The value-driven firms are partially involved in sustainable practices, but their actions are driven by volunteerism and expression of a champion that consider sustainability processes important but are limited by scant financial and economic resources. Companies considered as reputation seeking believe that sustainable efforts are an

easy way to improve their reputation, which means enhancing their value as perceived by the hosting social and economic environment, as well as increase their products' prices. To reach a high level of reputation, companies employ signs, logos, and statements, such as sustainability reports and brands. Finally, the excellence-seeking firms consider sustainability both as part of their business and the philosophy of their operations, making high investments to improve cost efficiency and ensure green production. In this case, the higher price paid by the consumer is justified by a product with a high quality of raw materials and an environmentally sensitive way of production.

Gabzdylowa *et al.*'s (2009) study is based on the New Zealand context, with the country's close attention to sustainable issues. Due to Italy's limited experiences in such issues, Ripasso was selected among a group of firms considered sustainability sensible and involved in the Magis project. This particular case was chosen because of its position in the matrix as an excellence-seeking enterprise. As shown in the findings, this cooperative winery considered the acquisition of a sustainable brand and related certification as an effort driven by the importance of its entry to this particular market and its strong belief that to act for sustainability is the correct decision.

Magis is an Italian initiative on sustainability in wineries and internationally recognized by *Organisation Internationale de la Vigne et du Vin* (OIV), an intergovernmental organization with scientific and technical objectives concerning the winery sector. The project aims to develop the sustainability and quality of Italian wine in an effective and transparent way, involving wine producers, the scientific community, oenologists, and the industry. In view of the lack of techniques on how to improve sustainability practices, Magis is an example of how an external initiative can improve the protocols and knowledge on this issue. Despite the entrepreneurs' belief and their will to act for sustainability, there is often a lack of understanding on how complex its implementation process can be. Through a protocol adapted to different geographic areas and farming styles, wineries record results by using a computerized platform. This system permits monitoring the data collected, with the aim of improving sustainable production.

Between September and November 2014, we conducted semi-structured interviews with key informants at the farm (oenologist, general manager, accountant, and agronomist) who were involved in the introduction and development of the Magis project. We also held a meeting with the geographic area responsible for the project.

The framework of the semi-structured interviews was carefully adapted to the specific issues to be explored with the various professionals, providing both different points of view on the same topic and important notes on particular aspects (Miles *et al.*, 2014). The open questions of the questionnaire

enabled interviewees to respond in their own words, and because the interviews were held at the farm, the comfortable environment helped them carry on a natural conversation. We taped the interviews and coded the written transcriptions by using computer-assisted, qualitative data analysis software (Atlas.ti), which was helpful for organizing data (Bryman and Bell, 2011). After the first round of open coding, we refined the coding labels through a discussion among the authors and summarized the data by using main concepts, such as sustainability drivers, barriers, and measurement tools. Field notes and other documents provided by the cooperative and the Magis protocols were included in the hermeneutic unit and subjected to the process of analysis.

RIPASSO AND SUSTAINABILITY IMPLEMENTATION IN PROCESSES

Ripasso is a cooperative winery with more than 100 partners among the best wine makers within the zone of analysis, using about 150,000 tons of grapes yearly for the production of white, red, and rosé wines, highly recognized by Italian certifications of quality.

Ripasso considered participation in the Magis project from the beginning of its implementation. Since the first years of the 21st century, Ripasso has demonstrated the application of sustainable principles in the management of the vineyard. Through the project, this attention was expanded to the entire production, increasing the application of sustainable principles to the other parts of the chain, such as the canteen. Initially, the process was applied only to one type of wine, with the aim of extending the implementation to the entire production.

Because as a cooperative (see for example Begalli and Capitello, 2015; Warner, 2007), Ripasso engages in the production of many wineries, the interviewees emphasized how the approach to the protocol could differ, depending on the dimensions of a firm. The common improvement has focused on precision in vineyard management, which is usually easier in small farms with a limited number of plants. The protocol to be followed issues the rules to maintain the practices in a range of actions that are considered “sustainable.” In this regard, from the soil treatment to the harvesting phase, the framework is built to monitor the production through a particular software, which also allows Magis to have a broad view of the implementation level at each firm involved in the process and to identify areas for further improvement.

From the respondents’ opinions, it is clear that one of the main drivers that led to the introduction of the protocol was consumers’ increasing attention to environment-friendly products and brands linked with firms that considered the impacts of their production. Regarding the market position of winemakers interviewed, it means long-term returns in terms of a higher price per bottle, in accordance with brands or labels that certify the sustainability of the wine or the winery.

The key informants had not observed vast changes in their daily work, and they stressed that main efforts would have been made at the vineyard level in terms of fertilizer use, water management, and the care of plants. In different ways, the interviewees provided evidence of the importance of knowledge development on sustainability, which had been disseminated among other farmers, thanks to the cooperative nature of the canteen, that have worked as a network (Marshall *et al.*, 2005). As noted by Warner (2007), also in this case the drivers that guide the implementation of sustainable production have a general need to increase the sustainable techniques and quality level of vineyard management as a common starting point. In practice, this means contributing to improving the quality of both the grapes harvested, which are healthier with the reduction of chemical fertilizers, and the work environment. All the interviewees stated that in their opinion, the protocol application had resulted in cost reduction in terms of higher production efficiency. Similarly to Forbes and De Silva (2012), despite the perception of the people interviewed, no evidence from the data collected proved that the cost reduction is directly linked with sustainable improvements. In accordance with Hughey *et al.* (2005), the adoption of a more sustainable process in itself provides not clear improvements in environmental performance.

Notwithstanding several positive effects on Ripasso firms by the implementation of sustainability practices in the wine production, numerous barriers were reported by the respondents. On one hand, the lack of measurement prevented performance monitoring; on the other hand, implementing the protocol meant increasing the amount of data to be measured. As observed about the cost reduction that was perceived but not recorded, similarly, the general opinion that the implementation of sustainable protocols increased the value of sales was not demonstrated by precise accounting. This lack of proof was also common in the supposed improvement of the biodiversity quality in the vineyard.

CONCLUSIONS

According to Renton *et al.*, (2002), sustainability issues in the winery sector have been driven by consumers' expectations and increasing attention to more sustainable production in terms of economic, social, and environmental aspects. Despite the stronger focus on this topic, knowledge remains limited regarding the drivers that enhance the process of development and the measurement of these aspects. In view of this literature gap, this study contributes in shedding light on the drivers of sustainability implementation and the barriers to the path that Italian wineries should take. Moving from the demonstrated attention to the Magis project, we selected the Ripasso cooperative for its best practices in sustainability initiatives, highlighting problems and levers to be considered in introducing sustainable aspects to wine production.

In accordance with Marshall *et al.* (2005), the introduction to a sustainable process is usually driven by the research on the higher quality of grapes harvested, management's attitudes to sustainable issues, and a personal desire of the entrepreneur (Tee *et al.*, 2007) also for the benefit of customers who are more interested in sustainable production. At the same time, participating in a sustainability project means sharing knowledge among farmers, researchers, and project developers.

According to previous studies on sustainability implementation in wineries (Ohmart, 2008a; Forbes and De Silva, 2012), it is difficult to measure the level of adoption in sustainable farming operations because sustainable agriculture addresses all aspects of farming and encompasses a broad range of practices across the continuum of sustainability. The respondents' perception on cost efficiency and effectiveness is probably connected with the rationalization of processes due to the protocol boundaries. Despite this positive feeling demonstrated in the Ripasso environment, it is important to remember that enhancing sustainability also means the ability to measure these practices' effects on performance.

This study has some limitations. The case study analysis is limited to the cooperative canteen rather than to consider all the farmers involved in the sustainability implementation process. Furthermore the analysis focused on Magis project strongly link the results with the features on the related protocol. Further studies are needed to gain a better understanding of these last issues and also to better appreciate the measurements in terms of cost efficiency and performance related to the sustainability implementation.

GAINING LEGITIMACY IN NON-PROFIT GOVERNANCE. THE ROLE OF STAKEHOLDER ENGAGEMENT

Moggi, Sara¹; Zardini, Alessandro¹; Leardini, Chiara¹; Rossi, Gina²

¹University of Verona, Verona, Italy

²University of Udine, Udine, Italy

ABSTRACT

The growing importance of non-profit organizations (NPOs) in raising the social and economic development of a local community has increased the number of research studies related to NPO governance mechanism features to understand territorial needs. In this sense, the representation of the local community within boards is a governance tool that allows NPOs to increase legitimacy. Moving from Guo and Musso (2007) and Rossi *et al.* (2015), our research explores how governance dimensions affect representational legitimacy. This paper analyzes among Italian Bank Foundations—organizations where the representation of community within boards is provided by law—the case study “Sigma.” An in-depth analysis of this organization’s practices provides insights from a well-balanced representational mix, in which different local stakeholders have different weights in appointing board members. This paper improves the understanding of governance representational dimensions, describing levers that can contribute to gaining trust and increasing the ability to act in the interests of the local community.

Keywords: *local stakeholder, representation, Italian Bank Foundations, governance, stakeholder engagement, case study, Italy.*

INTRODUCTION

The growing role of non-profit organizations (NPOs) in fostering the social and economic development of a territory has increased the number of studies focused on their governance mechanisms and board capabilities to understand local community needs. In this sense, a good governance acts to better plan actions in light of the local communities’ interests and of gaining stakeholder trust. Among the studies on governance mechanisms, some authors have focused attention on the representation of the local community within boards to increase NPO legitimacy (Pitkin, 1967, 1969; Cnaan, 1991).

As representation is a controversial and multi-faceted concept (Pitkin, 1967), models that analyzed this issue in NPOs highlighted several dimensions of representation corresponding to several mechanisms for representing stakeholders' interests in decision-making processes (Guo and Musso, 2007; Guo and Zhang, 2013; Rossi *et al.*, 2015). While these models illustrated how different dimensions of representation influence the representational legitimacy of an NPO, they did not explain why this happens.

Due to a lack of studies on this topic, our research explores how and why some governance mechanisms could affect the representational legitimacy of Italian Bank Foundations (IBF), a kind of NPO where the representation of the local community within boards is provided by law.

IBFs originated in the early 1990s under the so-called Amato Law (Law No. 218 of 30 July 1990), which led to the privatization of community-owned public savings banks with a strong vocation of solidarity toward the territory in which they operated. The law separated philanthropic undertakings from lending activities and created 88 community-owned IBFs (Jassaud, 2014). In light of their aim, IBFs must use the income derived from the management of their endowments exclusively for the development of the territories in which they are rooted (Anheier, 2001). In this way, the law defines general matters of governance, and statutes must consider deeply how to represent community interests in decision-making processes. Each bank foundation is called to describe in its own statute the mechanisms that allow the board to engage community representatives in determining objectives, priorities, and long-term plans for both asset management and grant-making activities.

The link between an IBF and its local community is strengthened by the mechanisms through which board members are appointed that aim to balance several stakeholders' claims. As highlighted by Rossi *et al.* (2015), four groups of stakeholders are representative of the interests of the local community (public sector entities; cultural, educational, and research organizations; trade and professional associations; civil society associations). These groups of stakeholders have the power to designate IBF's board members or to propose lists of candidates from which the expiring board chooses new members.

Moving from the frameworks proposed by Guo and Musso (2007) and Rossi *et al.* (2015), an explorative case study is presented to identify the features of representational dimensions found in a large-sized IBF (Sigma). This particular case was selected according to asset dimensions and the well-balanced representation in board composition in terms of the four stakeholder groups.

This paper is organized as follows. In the next section, we present a summary of the existing literature on representation within boards by considering the main models developed for analyzing this issue in NPOs. The methodology section describes the selection criteria for choosing the case study Sigma, as

well as how data collection was carried out. Then, we present and discuss the main findings from the case study in terms of representation dimension features and tools implemented in this context. At the end, we provide final issues identified through the case study analysis, as well as further suggestions and limitations to solve in future studies.

THE DIMENSIONS OF REPRESENTATIONAL LEGITIMACY IN NPO BOARDS

While there is a general scholarly agreement that NPOs should embody community interests in their boards, little is known about the mechanisms to effectively achieve this goal. Scholars emphasized the role of participation as a mechanism for engaging the community in decision-making processes and making non-profit boards more responsive to community needs (Brown, 2002; Checkoway & Zimmerman, 1992; Freiwirth, 2007; Harrison & Mort, 1998; LeRoux, 2009; Saxton, 2005). More recently, a recent area of research in the NPOs field focused on engaging local community through representation on boards (Guo and Musso, 2007; Guo and Zhang, 2013; Rossi *et al.*, 2015).

Most of the models that analyzed the issue of representation in NPOs are based on Pitkin's (1967) work, 'The Concept of Representation'. In her study, Pitkin (1967) defined 'representation' by identifying four dimensions: substantive, symbolic, formal, and descriptive. Substantive representation occurs when board members act in the interests of the represented community. Symbolic representation occurs when the community trusts an organization as its legitimate representative. Formal representation is based on formal mechanisms that establish the way board members are selected and stay in charge. Finally, descriptive representation is concerned with a board whose members have socio-economic and demographic characteristics similar to those of the organization's constituencies.

Starting from Pitkin's models (1967; 1969) and Rothschild and Russell's study (1986), Cnaan (1991) summarized ten criteria for analyzing the level of representativeness of NPOs: free open elections, member participation, informed membership, accountability to constituents, due process, level of similarity, similarity in perceived needs, *cui bono*, successful advocacy, and competition among NPOs.

More recently, Guo and Musso (2007), by considering participation and representation to be interconnected in the context of non-profit governance, proposed a comprehensive conceptual framework to understand specific sorts of representation in NPOs. Starting from Pitkin's (1967) idea, these authors proposed a five-dimensional model by adding to Pitkin's (1967) conceptualization another dimension called "participatory representation." This new dimension occurs when there is direct and active involvement of the community in organizational activities. The authors applied their conceptual framework to two community-based organizations to demonstrate the complexity of representational mixes in NPOs. Specifically, as illustrative case studies, they considered a charitable

service provider, whose primary goal was to deliver services to constituents, and the Los Angeles' neighborhood councils, whose primary goal was to engage in external representational activities. The findings showed that a uniform 'gold standard' does not exist and the organizational type influences the extent to which NPOs are representative of the different dimensions. In particular, formal representation was lacking in the charitable service provider, while the participatory mechanisms were relevant; conversely, the neighborhood councils paid less attention to the participatory mechanisms and placed a particular emphasis on formal procedures to pursue substantive and symbolic representations.

In developing their framework, Guo and Musso (2007) highlighted features and bonds among the five representational dimensions. Substantive and symbolic representations are outcome measures of the organization's "representational legitimacy" (Guo and Musso, 2007, p. 311), while formal, descriptive, and participatory representations are capacity measures of the representational legitimacy that contributes to achieve substantive and symbolic representations. The authors called for more in-depth studies to clarify the extent to which formal, descriptive, and participatory arrangements can promote the capacity of NPOs to act (substantive representation) and stand (symbolic representation) for the interests of their communities.

Rossi *et al.* (2015) integrated this model detailing more in depth the broad categories suggested by Guo and Musso (2007) for describing capacity measures. In light of this, they identified new formal and descriptive mechanisms of representation that NPOs may adopt to achieve a more representative governance. Compared with prior literature, they enriched the governance mechanisms for representing communities' interests within boards and highlighted that a pivotal role in gaining representational legitimacy might be played by:

- other formal arrangements for selecting board members aside from elections (e.g., direct designation by stakeholders, lists of candidates proposed by stakeholders among whom the outgoing board of trustees chooses its new members, appointment by the outgoing board of trustees);
- the groups of stakeholders called to appoint the board members that, in accordance with Leardini *et al.* (2014), are distinguished in public sector entities, culture education and research, trade and professional associations, and civil society associations;
- and, finally, the residence of board members within the same territory in which the NPO operates.

Moving from Guo and Musso's (2007) study, Guo and Zhang (2013) provided a validation of their framework within the Chinese context. By investigating how formal, descriptive, and participatory arrangements are linked with substantive and symbolic representations, they confirmed a positive relationship between capacity and outcome measures, with the exception of formal representation. To better analyze these relationships, Guo and Zhang (2013) identified a set of measures for representational capacity dimensions. In particular, formal representation was identified by the presence of formal arrangements for board elections and recalls. Descriptive representation was analyzed by considering the composition of the board of directors and by surveying the perceptions of the executives on the congruence between leadership and constituent demographics. Finally, participatory representation was measured by asking respondents to evaluate the quality and extent of the communications between NPOs and their key organizational constituents. In so doing, Guo and Zhang (2013) confirmed the importance of operationalizing in a detailed and clear way the representational capacity measures for exploring their relationships with substantive and symbolic representations.

Moving from the frameworks presented by Guo and Musso (2007) and Rossi *et al.* (2015), the aim of our study is to develop a new model of stakeholder representation within governance, presenting an in-depth analysis of a case study with a high level of legitimacy and well-balanced representation in board composition in terms of the four stakeholder groups. Our model considers Rossi *et al.* (2015) for input dimensions (capacity measures) and Guo and Musso (2007) for output dimensions (outcome measures), investigating how governance mechanisms could affect the representational legitimacy in this particular context.

METHODOLOGY

With the aim to analyze features of representational dimensions in the particular context of IBFs, Sigma was selected according to their large asset dimensions and balanced representation of stakeholders in governance composition. To achieve the research objectives, we selected a particular case study (Patton, 2002) that could offer insights into participatory governance mechanisms and several stakeholder engagement tools. This large-sized IBF provides wide information on its 'representational mix' (Guo and Musso, 2007), where different groups of local stakeholders have different weights in appointing board members (Rossi *et al.*, 2015). Furthermore, in accordance with Suchman (2005), this foundation is hosted by a context that recognizes its high level of legitimacy.

The data collection was carried out from January to March 2014 through four semi-structured interviews with key informants of the organization (e.g., president, two members of the board, and an

executive) that have a thorough knowledge of governance mechanisms that could affect the representational legitimacy of the foundation. Interviews had open-ended questions, lasted 45 minutes on average, and were audio-recorded, transcribed, and coded. To improve the reliability of our findings, we combined and compared information from different sources through a data triangulation approach (Eisenhardt, 1991) by integrating the interviews results with an analysis of the available documents (statute, code of ethics, board regulation, reports, other institutional documents) and the institutional web site.

SIGMA FEATURES OF COMMUNITY REPRESENTATION

Sigma is a large-sized foundation with the aim to support the social, cultural, and economic needs of the local community, focusing its attention on the specific territorial zone that hosted the organization, in particular, on five areas of interest: 1) research; 2) education; 3) art, cultural heritage, and environment; 4) healthcare sector; and 5) charity.

Since the first analysis of the documents, formal representation was highly granted by the statute's disposals regarding board composition. The "expiring board" chooses new members by selecting among a list of candidates proposed by local stakeholder groups and only three members are appointed directly from the expiring board. According to Rossi *et al.* (2015), no arrangements are proposed from the statute on the socio-demographic characteristics of the board members, while there is a specific article on the interest that these subjects must represent on the board. The 12 members remain in charge for five years and must be qualified to carry out their tasks in foundation management and hold professional knowledge and experience within the bank foundation's areas of action. Skills must be acquired through executive and control positions on boards or committees of private or public organizations or through the fulfilment of educational, research, or religious functions. In addition, experiences in entrepreneurship and consultancy are appreciated in the candidate's comparative evaluation.

In addition to the professional features of members, the descriptive dimension is also comprehensive of a specific statute's disposal in terms of stakeholders that must propose the range of candidates. In Sigma, the percentages of proposal defined by the statute are: 33.33% from public sector entities, 16.7% from trade and professional associations, 16.7% from civil society associations, 8.3% from culture, education and research, and 25% from the expiring board. Despite this specific disposal, looking into the actual composition of the board, it can be seen how these percentages are quite different, namely: 25% from public sector entities, 25% from trade and professional associations, 16.7% from civil society associations, 8.3% from culture, education and research, and 25% from the expiring board, involving

professors, businesspeople, professionals and non-profits leaders. In this sense, on the one hand, people interviewed underlined the importance of maintaining a balance among different represented interests of the local community on the board with a well-balanced representation. On the other hand, these subjects stated that the composition is not a guarantee of the personal quality of each person appointed, because everyone is mirror of her/his own experiences, skills, and values. Finally, the statute establishes that all members of the board must be residents within the same territory in which the NPO operates.

The participatory representation can be considered in terms of annual meetings that total at least six per year, representing a high frequency compared to the average of 3.7% (Rossi *et al.*, 2015). In addition, great attention is dedicated to commissions and committees involving the local community both in the definition of Sigma's funding priority and in projecting actions in particular areas of interests.

This engagement of stakeholders can be carried out through a number of direct and indirect channels. In developing projects, Sigma usually organizes round tables and focus groups during the period of the entire process, involving experts of the topic of intervention and the beneficiaries of funds (substantive representation). Because of cut funds of public administration, NPOs try to satisfy part of the need not covered by the welfare system. In light of this and of the large variety of sectors of intervention, the respondents underlined the importance of local community engagement to understand the priority in terms of disbursements (substantive representation).

Ex post each project is also evaluated using a framework that provides a scale in terms of goals reached using the fund devolved by the foundation. This method is also helpful in the evaluation of long-term and complex strategies composed of several actions that involve numerous subjects from the local community. The implementation of this framework was also driven by the need to increase the transparency and consequently the trust in the foundation using an objective tool in the project evaluation (substantive representation).

Symbolic representation is clearly shown through one-way communication events. The primary one is an entire day dedicated to foundation activities and the presentation of the annual report disclosing the main actions of the previous year. During this meeting, the document is presented to the main local stakeholders of the community without asking for any feedback on the effectiveness or usefulness of this accounting tool.

Sigma also appears active by using social networks, such as Facebook, and one of the interviewees evidenced the role of the foundation website as an important and clear communication tool, easy to reach, and preferred by stakeholders.

DISCUSSION AND CONCLUSIONS

Because of a lack of studies on governance mechanisms and representational legitimacy in NPOs, our research explores in which ways governance features have declined and how this could affect the representational legitimacy in the particular context of IBFs, in which the representation of the local community within boards is ensured by law. In doing so, we consider as a framework of analysis Rossi *et al.* (2015) for input dimensions and Guo and Musso (2007) for output dimensions.

From the case study of Sigma, it is possible to note that, despite a disposal by law of the representation of the local community on the board, it is up to single NPO to define the terms that determine this aspect. In our case study, the statute is an important formal tool that clearly states the rules to follow in appointing board members, considering a well-balanced coexistence of local stakeholders' claims. However, personal features, experiences, and values of new members are variables that can only be partially managed in appointing these subjects.

The case analysis suggests several improvements must be made in terms of governance mechanisms that enhance to reach or maintain the trust of the local community. Committees, commissions, round tables, and focus groups are organized as stakeholder engagement tools with the aim to act for the community in the transparent reading of their needs. On the contrary, the annual report is just a communication tool rather than an accountability mean, and lacking is the feedback from stakeholders regarding the foundation's performance. According to Moggi *et al.* (2015), reports and stakeholder engagement in reporting are not considered priorities for governance that employs media as a symbol of the foundation's legitimacy.

According to Guo and Musso (2007) and Guo and Zhang (2013), these results highlight that governance mechanisms could influence in different ways the legitimacy of NPOs in terms of their capabilities to respond to local community needs and the influence of local stakeholders in appointing board members. In accordance with Rossi *et al.* (2015), the case also showed how stakeholders have an impact on Sigma decisions through the employment of several engagement tools.

Insight from this research improves the understanding of governance representation mechanisms, describing the levers that can contribute to gaining trust and increasing the ability to act in the interest of the local community. These results will increase the capability of NPOs managers, practitioners and policy makers to shape the effective actions in meeting local community needs.

TEACHING BUSINESS ETHICS FROM A CHRISTIAN SOCIAL ETHICS PERSPECTIVE - STUDENT PERCEPTIONS

Nicolaides, Angelo

Graduate School of Business Leadership, University of South Africa, Midrand, South Africa

ABSTRACT

The highly competitive global business environment is increasingly devoid of ethical behaviour and tends to focus mainly on shareholders rather than all stakeholders. Business schools should seek to maximize the impact of ethics education on modern businesses so as to allow them to gain a sustainable competitive advantage. The perceptions and consciousness of management students concerning business ethics are generally flawed, as is evidenced by the often highly questionable unethical behaviour of many current business leaders. Do students reflect adequately on values and modes of thinking and acting ethically? What are the main issues in Business Ethics education? Is the ethical gnosis of students at business schools enhanced for a better business world which impacts positively on society?

The goal of this paper was to use an exploratory qualitative research study. It consisted of an interdisciplinary literature review and purposive sampling of fifty respondents who completed self-administered questionnaires on five point Likert Scales. These allowed the researcher to unpack perceptions as to the worth of Business Ethics education at a top African management school. This research will be used together with a survey of students currently engaged in a Business Ethics course in order to examine the likely impact of Business Ethics education on them personally and how likely ethics education is to influence their future business dealings. How credible is Business Ethics teaching perceived to be and is it valuable if at all? Are students as future managers and employees likely to be dependent and reliant on only material gains or will their Business Ethics education connect them to the world of business in a deeper sense?

Keywords: *Business Ethics, Christian Social Ethics, management, leadership, education, students, globalization*

INTRODUCTION

In order to effectively teach business ethics necessitates a deep comprehension of what ethics entails on the part of both academics and students. While it is largely valid to argue that employees learn their values and build their ethical conceptual frameworks primarily at home, school and church, the reality of the work environment poses fundamental ethical challenges for employees at all levels of organizational hierarchy on a regular basis. When faced with a myriad of ethical dilemmas and moral mazes, the issue of doing the right thing becomes highly problematic and employees may battle to make and take decisions that are ethical in nature. This is particularly the case in organizations in which the ethos that pervades the workplace is devoid of a moral corporate culture. In such workplaces, some managers force employees to engage in unethical and highly questionable behaviour. This is despite such organizations purporting to adhere to strict codes of ethics and conduct. In organizations that are truly ethical, business conduct becomes more transparent and societal welfare is promoted. Where carefully crafted codes of ethics and conduct are employed in an honest fashion, and where organizations comply with corporate governance regulations and requirements, sustainability is more likely. Where ethical leadership is evident and leaders are also trusted and have integrity, success and sustainability are almost certain to follow.

It is the lack of ethical conduct which to a greater extent resulted in the global financial crises which have plagued global society in the last decade and which continue to pose a huge threat to economic stability. The often highly questionable actions of employees relating to ethical issues, has undoubtedly created a huge lack of trust on the part of many stakeholders and resulted in businesses losing reputations that were, in many cases, painstakingly created by them over many years in the service of society.

It is thus important for business school per se, to tackle business ethics as an important area of study and provide especially future business leaders with a solid foundation for understanding how it is that they can only succeed in business by adopting ethical strategies, processes and indeed day-to-day issues. The sustainability of an organization is thus largely dependent on the ethical stance that it adopts and the extent to which ethics is ingrained into its operational DNA. Consequently, business school in particular, are focusing more on promoting ethical business practices through the incorporation of ethics and values based education in their course offerings. The lack of congruence between the notions of wealth accumulation at all costs, and the enhanced bottom-line, and honest modalities of operation in business which focus on a triple-bottom-line approach, makes life difficult for students about to embark on careers in the business world. Business ethics is not a new concept. Indeed in ancient civilizations such as Classical Greece in about 350 BC, the notion of *arête*, loosely

translated to mean excellence, was taught by Aristotle (384 – 322 BC). In Aristotle's view, ethics was a highly practical rather than theoretical study. He maintained that one should strive to become good and wrote various treatises on ethics, including the mega-work, *Nicomachean Ethics* (Burger, 2008).

Aristotle taught his students, including Alexander the Great, that virtue includes the proper function (*ergon*) of a thing. He also articulated the notion that humans have a purpose which is specific to them. this purpose must be an activity of the *psychē* (usually translated as soul) in accordance with reason (*logos*). Aristotle also identified this most advantageous activity of the soul to be the aspiration of all human conscious action, *eudaimonia*, generally translated as "happiness" or "well-being". If humans wish to be happy in their lives they require a good character (*ēthikē*) and must also possess virtue (*aretē*) in their dealings with others. *Aretē* is generally translated as being moral, ethical and virtuous (Bartlett and Collins, 2011).

He discussed with his students how commerce in general should be conducted in an honorable manner and taught on wealth accumulation, the use of money and its value for society. He frowned upon usury as indeed did Adam Smith, who in his *Wealth of Nations*, had a great deal to say about business ethics.

Societies in the global arena are trying to address many issues related to ethics and the law. Organizations are also desirous of complying with regulatory issues so as to better serve the public interest. However, many negative issues still arise. In a study conducted by Pomeroy (2007) in the United States of America, seventy three percent of employees claimed they had been witness to unethical conduct in the workplace. A wide range of misdemeanors exist in business including inter alia time theft, where employees abuse work time for personal issues, using company resources for private use, theft of equipment at work, fear to blow the whistle on transgressors of ethical conduct codes, deception by false marketing etc. (Luna-Arocas and Tang, 2004).

There are unfortunately many daily examples of unethical conduct in business operations globally, in which especially business 'leaders' have abused their authority and for example, stolen billions of dollars. It is imperative that especially the senior managers set an ethical tone for their business as this tends to create an ethical ambience and also clarifies roles and tends to engender advances towards ethical decision-making. When business leaders create a culture that considers all stakeholders and value a team orientation and are transparent in their dealings in particularly their internal communications, they set the groundwork for improved financial performance (Maignan et al, 2011). Various major international corporations state that their business can only be sustainable and successful through their ethical behaviour (Veiga, 2004). The result is that organizations by and large strive to create an ethical culture which espouses the values and norms that are accepted as appropriate

behavior on their part. In this regard, senior managers have a huge role to play as they serve as role-models and create shared values while simultaneously promoting ethical decision-making.

According to other recent research, if leaders are seen to be conscientious, and also to the liking of stakeholders, especially their employees, they are invariably linked to the notion of ethical leadership which bodes well for sustainability (Kalshoven, Den Hartog, & De Hoogh, 2011). Academics such as Carroll (2004) and Vitell (2003) have also carefully considered the state of global business ethics. They have painstakingly argued about the many challenges that business ethics is facing and is likely to face faces in the years ahead. Vitell, for example, has scrutinized a wide range of conceptual and empirical works with the objective of promoting research in the consumer ethics domain. Carroll's (2004) research has tended to focus on a range of ethical issues that face stakeholders of organizations globally. Unfortunately it is evident that numerous business leaders adopt a strategy which is market orientated and they concern themselves only with shareholders and customers. They consequently fail to understand the critical importance of all stakeholders and this often leads to disaster and generally unsustainable business operations. According to Tarí (2011), it is essential to determine what stakeholders require in terms of ethics, social responsibility and quality management. Stakeholder concerns and interests must be identified by organizations so that the latter are able to effectively respond to them. With these ideas in mind, there is no doubt that business ethics has assumed a very important role in the global business conscience (Freyne, 2009; Gilmartin, 2008). "Leading businesses no longer debate the legitimacy of the role and importance of ethics, rather, they are forging ahead, finding new ways to put ethics into practice" (Krehmeyer, 2007).

Research into business ethics as such gained momentum during the 1960s and 1970s, and business ethics has been a principal issue in Church rationality on business issues in general for most of the last 1900s (Bowie 2000). De George (1987) has sketched the initial development of the business ethics field and maintains that business ethics has undergone five distinct stages of development from the 1960s up to the 1990s. Since that time there have been numerous other quantitative and qualitative research studies. Business ethics is now clearly in the spotlight as many organizations across the globe, both big and small, now recognize the importance of ethics in the workplace and in business conduct. It is now more common than ever to find organizations with officially trained "ethics officers" and with elaborate "codes of conduct/ethics" which are expected to be observed by all employees.

Christian Social Ethics is a useful means of promoting a Christian cultural value-based education, since it is eminently suited to the needs of contemporary business leadership education. The Christian Churches have often articulated that capitalism is problematic in that it promotes materialism and excesses in society and that this often leads to the exploitation of the working classes (Pope Leo XIII,

1891). In this context, Christian Social Ethics which has been operational for centuries, is a useful approach in seeking to resolve the dilemma between maximization of profits and an emphasis on shareholders as the only stakeholders of worth, and ethical business practices which are aligned with a total stakeholder approach. It is evident in what is offered in many courses viewed on the internet that many lecturers serving in business schools have restricted experience in dealing with business ethics as a subject of great worth to society in general (Sims & Sims, 1991). This is where Christian Social Ethics can present a structure to aid in the educational offerings of business schools.

The Church has been intensely interested in the social questions such as concern for stakeholders because of the religious and moral aspects involved. It supports the notion that the State as an institution has the obligation, right and responsibility to intervene on behalf of justice for employees and other stakeholders' social well-being. Employers and their workforces should also create mutually beneficial associations to protect their rights. The Church also maintains that in terms of Christian Social Ethics, it is imperative that organizations move away from a purely market driven capitalistic model and embrace one that promotes human dignity and worth and which is clearly conscious of all stakeholders.

Business ethics as a discipline is currently assuming greater importance than ever before in the offerings of especially business schools (Freeman, 2000). Business Ethics is generally defined as the moral guiding principles which preside over the expected good behavior of individuals in their business conduct. When employees behave ethically what this means is that they are acting within certain moral boundaries. To behave ethically in business is in any event an important way of promoting the sustainability of an organization. According to Magner (1989: 31) an awareness of what ethics entails in business, prevents one from doing something unethical and makes one reconsider one's actions and thus helps promote ethical conduct.

Given the changing globalized world in which businesses operate, it is vital that the ethics discipline has increased in importance and is to all intents and purposes a fully-fledged part of business management education. A myriad of ethical theories, both ancient and modern, are used to promote ethical conduct in the workplace and the perception of business ethics as a course of value has grown immensely. It has to all intents and purposes become fully integrated into management education. The business issues that are impacted upon by ethical thinking and action are indeed often highly complex thus necessitating greater engagement by students with the discipline. Enderle (1996) asserts that business ethics is now perceived as a unique discipline.

The global economic and financial crises since the turn of the millennium have obliged higher education institutions such as business schools, political leaders and captains of industry and also employees at all levels of organizations to carefully think about the ethical and moral values they embrace and how these can be consciously propagated in the capitalistic market economy. The idea is to create 'conscious' model of capitalism which considers stakeholder needs while still promoting organizational sustainability in triple bottom line approach which is cognizant of people, planet and profit. Consequently, renowned scholars such as Freeman et al. (2009) and Harris (2008) have made a concerted attempt to inculcate in business students, especially at MBA and MBL levels, the critical importance of a synergistic relationship between a business and the society in which it operates. Gentile (2010) has utilized research from both social psychology and decision-making processes to guide students and employees to more clearly appreciate the value of ethical conduct and honesty in business dealings.

QUALITY ISSUES AND TEACHING BUSINESS ETHICS

Teaching management students Business Ethics, promotes the maintenance of ethical conduct in dealings with a wide range of stakeholders and also to an extent, allows organizations to mitigate concerns relating to ethical problems which may adversely affect quality service provision. Such education also serves to protect consumers and improve service while minimizing costly litigation which negatively impacts the 'bottom-line'. Ethics courses provide future managers and employees with the tools for dealing with moral complexity in business which affects quality. In any event business decisions should have an ethical component. Quality issues impacted on by ethics education include the defining of appropriate behavior in business conduct, the establishment of organizational values, leadership and oversight matters, considering stakeholders, developing accountability and responsibility and especially in organizational auditing and improvement initiatives. The key features of quality business conduct include the principles of honesty, trust and integrity, openness, performance orientation, responsibility and accountability, mutual respect, and commitment to the organization. The control of quality in organizations is now all-pervading and prevalent, mainly as a result of the ever-increasing awareness of the high cost of a lack of quality which is concomitant to ethics. Quality is thus essentially a normative, prescriptive approach to the ways in which to transact with stakeholders. Quality, is not merely a necessary formal attribute of an organization, but also serves as the 'creed' of its employees. It is through the quality concept coupled with ethical practices, that quality contributes to the development of intangible resources which are inexorably linked to employees, including for example commitment, responsibility, expertise and trust. Quality is no longer only an operational practice, but is a non-negotiable strategic option which provides an organization

with a strategic competitive advantage. When ethically focused it engenders a virtuous progression of organizational learning which enhances the immaterial resources of an organization. Quality initiatives in any business need to be viewed as coordinating ethical practice in employees and in the products and services provided so as to achieve organizational goals. The ethics codes in organizations invariably deal with the domain of moral judgments as to what is right and wrong in terms of employee behaviors. Quality driven ethics codes in organizations apply to business questions of what to do from an ethical perspective and how it should be done, concerning a product or service, and how the organization interacts with all its varied stakeholders.

ETHICAL THEORIES

Anthropological research by McDonald (1999) suggests that ethical philosophies and the values espoused by those in positions of authority have a huge impact on the ethical choices and behaviours of the employees they oversee. According to Lewis and Gilman (2005) ethics involves thinking systematically about morals and conduct and includes the making of moral choices and thus stating or doing right and wrong. Hursthouse (2010) views ethics as the conscience between what is moral and immoral and right and wrong. When one acts ethically this is usually considered behaviour that aligns with accepted moral codes and this is proper conduct. Gustafson (2001) views ethical behaviour as something that is based on the assumption that employees act in what is considered the right way in each and every situation and this is generally recognized and expected by both public servants and the public at large. Personal moral values are learned from one's religion, family and school, but these are often inadequate for effectively handling the ethical aspects of complex business dealings.

Boylan (2000), states that "Ethics is the science concerning the "right" and "wrong" of human action". He refers to judgments, which are usually apportioned to people or to actions according to some moral and ethical basis. Ethical theories may be either teleological or deontological. The most conspicuous examples of teleological and deontological ethical theory are notably utilitarianism and the ethical theory of Immanuel Kant. Aristotle's ethics approach is another important theory founded on the notion of virtue (Boatright, 2000). Philosophers now tend to divide ethical theories into three main areas namely meta-ethics, normative ethics and applied ethics. Meta-ethics deals with the nature of moral judgement and essentially unpacks at the origins and meaning of ethical principles. Normative ethics on the other hand is concerned with the content of moral judgements and the benchmark for what is deemed to be right or wrong. Applied ethics looks at controversial topics like for example war and animal rights. (http://www.bbc.co.uk/ethics/introduction/intro_1.shtml#h2) Teleological theories propose that the rightness of one's actions is determined exclusively by the amount of good consequences or the extent to which an outcome produces certain actions. This implies that all actions

are justified on teleological theories by virtue of the end they tend to achieve, rather than some or other aspect of the actions themselves. Utilitarianism is reflected upon as being a teleological or consequentialist theory and maintains that an individual's obligation, or duty, in any situation is to perform the action that will result in the greatest possible balance of good over evil (Boatright, 2000). If a person realises that it would be morally good to do something then it would be highly irrational for that person not to do it. Business ethics thus provides future employers and employees with a moral map, a framework that they can use to navigate their way through complex ethical issues in the workplace.

Deontologists state that some actions are right not because of some benefit to oneself or others but because of the nature of these actions or the rules from which they follow. In this context, bribery and corruption are wrong irrespective of the consequences of these actions. Thus, bribery is wrong, some say, by its very nature, regardless of the consequences" (Boatright, 2000). There are also arguments grounded on principles such as the Golden Rule ('do unto others as you would have them do unto you'). Boatright (2000) agrees: "Obligation, or duty, is the fundamental moral category in deontological theories, and goodness and other concepts are to be defined in terms of obligation, or duty".

Very often, the faculty in graduate business schools inadvertently teach their students to base their ethical decision-making solely on an 'ends justifies the means' economic point of view. From a cost-benefit analysis perspective, business decisions are evaluated in terms of their return to investors. However, "Companies usually calculate the anticipated costs and benefits only for themselves, whereas legislators, social planners, regulators, and other users of cost-benefit analysis generally ask what the costs and benefits are for everyone who is affected" (Boatright, 2000). A cost-benefit analysis is thus a non-moral approach and is used mainly as a means for making major investment decisions. Given the various approaches, it is vital for students to be taught how to apply ethics in business and that their decision-making be tuned in to ethical practices. Their personal values and those of the organization are easier to determine and align. Studying business ethics empowers students to identify ethical issues when they manifest themselves. They are also guided in decision-making processes and how to drive ethics in the workplace.

THE NEED TO TEACH BUSINESS ETHICS

It is essential that future leaders be able to make decisions within the internal and external environments of their organizations. Business does not operate in isolation but rather with many stakeholders that leaders must take into consideration. This is especially the case given that a bad ethical decision can adversely affect the whole of society. Business ethics basically interrogates whether

or not certain businesses are acceptable in today's business environment. By teaching business ethics to future employers and employees, they are more able to recognize and effectively resolve ethical issues that may arise within the organization in which they work. When employees are unethical because of their inability to handle individual moral dilemmas their conduct invariably adversely affects the entire organization in some way or other. A person may be 'good' but if they are not adequately educated to meet ethical challenges that will arise, disaster will ensue. While some virtues are self-evident such as honesty, transparency and just action, when it comes to business strategy, these may prove to be elusive in what are often complex scenarios. The result is that a law may be broken.

Since personal values are vitally important to promote success in business, the fundamentally important issue for organizations is to recruit ethical employees that possess strong personal moral values and seek to further develop their ethical business approach. Organizations need to support employees ethical attitudes and reinforce ethical conduct. Ideally, the employees, especially the future leaders, should be coming to the workplace with a good idea of what ethics entails. In this regard it is imperative that employees come to understand how they in fact belong to the organization in which they are working (Ferrell & Ferrell, 2011). While it is true that an individual's ethics are inculcated from youth by, for example, parents, peers and churches, ethics can still be taught. From Classical Greece times, the ancient Greek philosophers understood to well what is required in leaders. Socrates for one, believed that virtue was a matter of understanding. When one comprehends what is good and what is evil, they are cautious, self-controlled, are brave and possess a spirit of justice. Aristotle on the other hand debated that while virtue has an intellectual component, it also encapsulates a virtue of character that is gradually developed by education. Hursthouse (2010) asserts that there is a very strong notion of moral motivation in Aristotle's approach, but he also stresses that the virtuous person is far better equipped to meet the demands of acting from a sense of moral and ethical duty.

Socrates debated the question of ethics and his stance was unequivocal. Ethics consists of knowing what we should do in any given situation. He was of the belief that such knowledge could be taught. In any event, according to his teachings the best way for people to live was to focus on the pursuit of virtue and doing the right thing at all times, rather than the pursuit, for example, of material wealth at all costs. He promoted the notion of a sense of community, as this was deemed to be the best way for human beings to grow together (Nichols, 1987). Recent research also suggests that a person's behaviour is greatly influenced by their moral perception and moral judgments and these are based on learning (Velasquez, et al., 1987). Consequently, as students expand their insight and understanding of the business ethics field during their studies, they are more likely to take an informed approach and have a rounded understanding of what ethics entails. They are also well placed to tackle the challenges that

may manifest in the workplace in the form of ethical dilemmas and moral mazes they must face on a daily basis. To intentionally expose students to business ethics in the course of their studies and develop their basic problem-solving approaches concerning ethical issues, will undoubtedly influence their awareness of moral issues. It will also impact their judgement when it comes to making important decisions.

A descriptive approach may be utilised which describes how things are currently being done in business, or a normative approach which describes a more idealistic view of what ought to be happening in business. Ethics is not that straightforward for many students since different cultures approach certain matters in different ways. For example, in certain Asian and African nations, it is customary in business to offer a potential customer a 'gift' which would be frowned upon in many western nations. It is essential then to focus in education on business ethics on issues relating to diverse moral philosophies and to examine many case studies, thus looking at personal approaches to making ethical decisions in the workplace.

In this regards Forsyth's Taxonomy (1980) on ethics would be very useful for academics to employ. This includes:

- (1) Situationism: which promotes a contextual analysis of morally questionable actions;
 - (2) Absolutism; which uses unchanged, universal moral principles to formulate moral judgments;
 - (3) Subjectivism: which argues that moral judgments should depend primarily on one's own personal values;
 - (4) Exceptionism: which concedes that exceptions must sometimes be made to moral absolutes.
- (Forsyth, 1980)

By understanding these different ethical perspectives, students can develop individual critical thinking skills and better understand how values and principles should be part and parcel of all ethical decision-making. Students as future leaders and employees must be able to use their personal moral compass to make careful ethical decisions. Tseng and Fan (2011), state that an organizational ethical climate influences employee attitudes toward ethics and also how they participate in activities. This is essential for students to note as they will be involved at some stage of their careers, as leaders, in co-creating codes of conduct/ethics with their employees. If they and their employees are involved in the creation of the code, they are more likely to observe it.

Business ethics needs to address all possible ethical risks facing an organization and industry. Business schools need to provide future executives with ethics education that is of lasting value. It is also critical to collect feedback on business ethics education from the most important stakeholders—from MBL students themselves, which is what this research has sought to do. Business ethics courses need to teach students about the importance of codes of ethics and how to create these, compliance requirements issues, adherence to the laws and regulations and general conduct in business practices via case studies on topics such as, inter alia, environmental issues, cultural diversity, stakeholder engagement, corruption, developing an effective ethical organizational culture, workplace health and safety, employee education, sustainability issues, employee rights and marketing and recruitment of employees. What is thus sought are well rounded students who can traverse ethical conflicts, moral mazes and ethical dilemmas in the workplace. There is evidence, according to Treviño et al. (2004) that suggests that if an organization employs ethical employees, this in itself limits unethical conduct. This is ideal when the workplace culture is also ethical in orientation and where doing the right thing is exuded in the ambience of the workplace (Treviño, Brown, & Wall, 2004).

A CHRISTIAN SOCIAL ETHICS APPROACH

It is an indictment on certain academics at business schools that ethical values and business understanding are viewed as two distinct domains. Very often the business understanding includes profit maximization and ethical dilemmas while the ethical aspects such as honesty and moral action are viewed as a world apart. A Christian Social Ethics approach will serve to integrate these domains and guide a business to sustainability. In such an approach, theological and ethical reflection are linked to teachings of holy scriptures on matters such as employee moral duties and the often tricky relationships between employers and employees. This approach also highlights the notion that good will between people can only come about as the result of respecting the rights of others. Moral duty and the moral 'ought' as used in deontological ethics originate from religious reasoning and theological Christian Social Ethics, where God as the higher being, is the definitive source of morality. In terms of this notion, people have to obey God's commands. Clearly then moral duty and a moral 'ought' are apposite. In this approach, there is a great need to protect the environment while also affording employees their basic human and labour rights in terms of the laws and regulations in a society. Social and economic justice are paramount issues as the common good is sought. In addition to this, love and truth should pervade the workplace and organizations need to be partners of the state in seeking solutions to a myriad of social and economic issues. The welfare of all stakeholders is sought in a spirit of justice, sustainability and solidarity with all fellow human beings. Christian churches teaches that man is indeed a very unique creation and should have a special dignity as one of a larger global

community. Man thus has a dual anthropological purpose to serve himself and seek the just welfare of humanity in a sustainable fashion. Many individuals frequently hold others to a higher standard of conduct and rationalize what they do or simply fail to see their own ethical lapses (Bazerman & Tenbrunsel, 2011). This is why a business course is important, as it highlights what is acceptable and not acceptable in business dealings.

Christian Social Ethics stresses that people should thus seek to understand and reflect ethically on all their actions in their processes and in their institutions. They should carefully weigh up their actions and the implications thereof and constantly strive to seek opportunities to uplift society. Business applying Christian Social Ethics should apply a moral system of values, norms and expectations in their strategies and integrate ethics in all their dealings. All employees and other stakeholders must be treated humanely and business leaders should be morally committed servants of society and manage their employees and all stakeholders with the utmost respect. The church can and does play an important role as an agent of promoting responsible business operation, not by suggesting policies, but rather by aiding leaders to set a moral compass. Such a compass can also be promoted by academics who provide a measure of competence and empower their students. Ethical leadership, supported by Christian Social Ethics, will empower employees from diverse backgrounds and with different individual ethical values to obtain a mutual comprehension of what ethical behavior is. They will thus be more able to establish an ethical organizational culture.

To guide students to appreciate these underlying forces in business ethics, changes are required in the way business ethics courses are taught in some institutions and also in the manner in which society embraces the development and implementation of business ethics in business matters. Efforts is required to bring about important pedagogical changes in both business schools and organizations in today's global business economy (Williams and Dewett, 2005).

PURPOSE OF THE STUDY

The primary purpose of this exploratory qualitative research study was to unpack the extent to which, and in what way a leading business school in South Africa offers Business Ethics as a course which is designed to enhance the critical thinking on ethics issues and ethics decision-making in general, for its graduates. A number of questions were unpacked in the research. Firstly, what ethics course was on offer in a Master of Business Leadership degree? Secondly, was the course an elective or a compulsory offering? Thirdly, what ethical knowledge and competencies are addressed in the ethics course? Fourthly, based on student responses, how likely is the impact of Business Ethics education to be on them and influence their future business dealings? Fifth, was the course deemed to be credible and the

teaching perceived to be valuable if at all? Sixth, on inspection of responses to questionnaires are students as future managers and employees likely to be dependent and reliant on only material gains or will their Business Ethics education connect them to the world of business in a deeper sense? Seven, to what extent can Christian Social Ethics improve the Business Ethics course?

METHODOLOGY

The population in this study is the summation of students in the second year of an MBL course and which had an interest in the research issues from which inferences could be made. The population size was 437. The sample size for this study was however a total of 50 respondents. The selection criteria used was the purposive sampling targeted group. Purposive sampling was applied because the selected members were chosen for a specific purpose as they had specific insights on data that was being sought. The study ensured the content and length of the questionnaire was appropriate for the level of the respondent sample so that respondents were not inconvenienced with a tedious questionnaire. The time taken to fill the questionnaire was timed to not exceed 10 minutes. The questions in both the questionnaires were of a structured format to ensure research objectives were achieved.

The researcher ensured confidentiality and anonymity of the research instruments and responses. Self-administered questionnaires were completed by the respondents free of the supervision of the researcher. It allowed the respondents to complete the questionnaire at their own pace and without being influenced by the researcher in their responses. Wegner (1999) mentions that design of a questionnaire is essential to ensure that relevant data to answer the research questions is extracted. Two sets of questionnaires were prepared which were to be administered to the fifty respondents. One questionnaire comprising ten items on a five-point Likert scale, related to the respondents indicating the importance to both them and society of Business Ethics. They were required to indicate their respondent type (see Appendix).

The second questionnaire also used a five-point Likert scale requiring strong agreement or disagreement with issues on whether the respondents would find what they had learned useful from a compulsory core Ethics module taken during the second year of a three year degree Master of Business Leadership (MBL). The programme was based on a combination of theoretical and applied content. The respondents had to have met prior admission requirements including at least three years' managerial experience so as to ensure they could contribute meaningfully to group discussions at the study schools. Respondents had to have done prescribed reading and recommended reading and contributed to group assignments and individual assignments and would write an examination later in the year.

The questionnaires were distributed personally to respondents who volunteered to answer them. An elaborate explanation of the relevance of the study was provided. The researcher collected the questionnaires from the respondents once they were completed at the end of a lecture session.

According to Leedy and Ormond (2010) research disciplines involving human beings who have potential to think, feel and experience physical or psychological distress, therefore it is imperative to consider the ethical implications of the researcher intentions. The study took into account the right to privacy and disclosure policy, honesty and informed consent as well as protection from harm for the respondents. There were no financial enticements or other forms of inducements given to respondents to encourage participation. Participants not interested to take part were not forced to do so and were free to decline. Participants were informed about the general nature of the study which was to ascertain what could be improved in the course. The researcher made sure to communicate to the respondents that all results will be treated with confidentiality and that they would remain anonymous.

The respondents could reflect broadly on the issues in the questionnaire and had the opportunity to make 'additional comments' as well. The response rate was 100% for both questionnaires and thus aided the reliability of the research as these were within the prescribed normative minimum of 50% (Leedy and Ormrod, 2010).

FINDINGS

Respondents	Population	Sample size	Non - Response	Responses	Response rate
Students on Ethics Course	437	50	0	50	100.0%

Table 3. Questionnaire two: What I have learned from this Ethics module will be useful for/in...

The research discovered and unveiled some interesting findings. On analysing the survey questionnaire responses and the additional comments of students, it became clear to the researcher that significant learning gains are made from the Business Ethics course offering at the institution in question. Many students felt that what they learned will have a far-reaching impact on their ethical stances at work. While many believe they are ethically inclined, some discovered they were not entirely ethical in their possible actions as per various case studies. The largest number of respondents, 70% (35), stated that the course made them very aware of corruption issues and also made them think twice about doing something which may have been unethical. The next largest number 64% (32) felt they learned a great deal from the course on the value of promoting the sustainability of available resources. Thirty one respondents (62%) felt that what they learned would promote a better caring planet and also inculcate ethical behaviour in them and thus in the workplace. Sixty percent (30) stated that they found the course useful for human resource issues, employee rights, environmental care and finance in business. Only 2% of respondents believed the course would not help with finance issues in the workplace or marketing and sales issues.

Students identified number of aspects of the course knowledge that were important to them as per questionnaires 1 and 2. They valued and enjoyed the range of case studies which dealt with ethical misdemeanours big and small and which related to a range of issues including corruption, employee education at work product safety, marketing/sales issues, quality service, globalisation matters, information dissemination, environmental care issues, promoting sustainability of resources, bribery, promoting a better caring planet, employee rights issues, whistle-blowing, workplace safety issues,

finance in business, shareholder disclosures, personal research issues and also reinforcing of ethical attitudes. The latter was considered to be the most important issue.

The course presentations, case studies, videos and group work sessions stirred the consciousness of most of the respondents. Most of the group felt that they were allowed to internalise ethical values and make them part of their thinking and decision-making on ethical behaviour issues. A key concept that numerous students commented on is that they learned that they may have problems in striving to making the correct ethical decisions. This was based on the recognition that many conflicts of interest, for example, may be present in a given situation. According to the respondents, ethics should be an integral part of every management programme and cannot be taught in isolation from any of the other subjects on offer.

A limitation of the study was the small sample size of only fifty respondents which was also from only one institution. This undoubtedly restricted the researcher making broader generalisations on the outcome of the Business Ethics course. The data collected was also only based on student perceptions and it is not clear how they would in fact act in a real work situation should an ethical issue arise. This research study is important because it builds upon and contributes to the body of knowledge that currently exists on teaching of Business Ethics at postgraduate levels.

CONCLUSIONS

The conclusive view of the researcher is that given the huge ethical crimes in the contemporary global business environment, there is no doubt whatsoever that executive/leadership education must include business ethics education. The business ethics discipline directly affects how management is taught in business schools. It guides leaders in their decision-making processes and also helps them to critically evaluate their actions and failure to act and how what they do or fail to do impacts on society in general. Business ethics courses sensitize students to moral business conduct and moral judgement that impacts stakeholders and ultimately promotes moral action. The research makes an original contribution in that it demonstrates that business ethics is in fact more important than most business schools in South Africa tend to imagine it to be. It led to unique insights on what students believe it's worth to be for them in the context of their workplace, albeit from one institution, that will serve to enhance the course offering.

A comprehension of what organizational ethics entails is critical in the development of ethical leadership. Each employee's personal values and moral philosophy are only one aspect in the decision-making process that can lead to legal problems. Students need to understand how they should be applying the rules and principles of ethical behaviour in their work environments. They cannot simply

consider themselves to ethical and they may not be able to deal with ethical dilemmas and moral mazes that arise in the workplace. Students are simply told to do the 'right thing' and strive to be ethical in whatever they undertake. However without some legal and ethics education, how can they possibly know what is right or wrong in a work situation? They need to fully understand what is at stake in a given situation and critically evaluate the ethical sensitivity issues. This should be followed by selecting decisions based on an ethical perspectives as well as legal considerations which are carefully thrashed out and motivated. The ethical decision is then made and its impact on the stakeholders is considered since it impacts upon sustainability.

Many students approached the researcher after the course and requested that they be allowed to undertake some ethics research in their third year. The research that students may undertake in their Research Report module, has the potential to make a significant contribution to ethics in the workplace as it provides a framework for the business ethics academic community to have an enhanced understanding of the most pressing ethical challenges plaguing our society today.

There is certainly a far greater interest in the relationship between business and society today than there was some decades ago and business ethics education is now a credible course. The positive comments on Corporate Social Responsibility aspects of the course in the additional comments section indicate that the respondents have a good understanding of the need for the Capitalistic market driven economy to become a 'Conscious Capitalism' which supports government in its drive to uplift society after years of deprivation on the part of the masses. Issues such as xenophobia and *Ubuntu* and cultural diversity promotion in the workplace were also evident in respondent comments.

The researcher, as the academic teaching Business Ethics clearly sees the need to focus on fine-tuning students' skills even further and teaching them how and why they need to avoid ethical hazards. Some respondents commented that the course was their best so far. While this is flattering, there is no doubt that through even more carefully designed learning modules and innovative teaching methods, the Business Ethics course can improve even more. It is also clear that the students are better equipped to handle ethics in the workplace than they would have been without the course. Their ethical decision-making skills have been enhanced. The group work discussions and feedback sessions on various case studies have also provided them with an in depth insight on issues at hand from a variety of cultural perspectives.

The researcher will employ a wider range of pedagogies and will in future course offerings include a combination of discussion, case studies, videos, lecture, and group work and students will also learn greater cultural diversity from the cultural backgrounds of their fellow students. This would also be

very important for students emanating from other African nations and cultural groupings. Business ethics is an indispensable part of the curriculum of the business school and should be for all business schools grooming future business leaders. Courses such as Business Ethics, furnish students with vital ethical business tools that they should utilise in the increasingly unethical global business environment. Ethics education must be viewed as strategic leadership and organizational change education. The case study method used provides students with concrete examples of many ethical issues and dilemmas. It enables them develop greater ethical insight through engaging with fellow students and the lecturer and through the resultant analysis.

RECOMMENDATIONS

References Considering the rampant corruption in South African society, the researcher suggests that ethics education be the cornerstone of all business leadership education. It should also include action learning and more inter-domain examples. No business school can hope to remain competitive without creating greater value through business ethics offerings. Students must be confident in their ability to consider the classroom inputs in terms of their own experiences and to face up to new ideas with their own often flawed beliefs, either individually, or in their designated study school groups. The pervasive and deeply rooted ethical issues facing both corporate South Africa as well as the Government demand urgent action from business schools as they develop future leaders.

Christian Social Ethics could play a greater role in and thus have an influence on what is taught business ethics. The theories as well as social aspects could assist in providing even greater critical evaluation of the role of business in society. Such a discourse could also impact very positively on budding entrepreneurs who will in the near future become the backbone of the South African and regional economy. The role of business in Corporate Social Responsibility initiatives and the creation of policies and codes of conduct/ethics can all be enhanced by inclusion of Christian Social Ethics notions. The latter must be integrated into business ethics curricula followed by critique and deeper discussion on ethics issues. Business ethics has a role to play in developing and authentic South African community which promotes the human dignity of all who live in the country. Christian Social Ethics also highlights human rights issues including labour issues (such as for example, fair wages and good work conditions), e-commerce, poverty, profits, free markets, social justice, diverse cultures, the use of science and technology, organizational learning and a sustainable society. A major emphasis is on humanity as a custodian of the natural environment and the desire of third-world nations to be involved in the globalised economy on a fair basis. The Church can provide the moral principles which should underpin the conceptual framework upon which business ethics is driven and offered.

Christian Social Ethics creates normative points of reference for ethics education and can help business schools in seeking to apply them into a wider discussion of desirable societal outcomes. If students reflect on ethical issues and the institutions in which they function and the structures of these institutions, and if they embrace the opportunities to improve society, business ethics would have arrived at its destination. When students comprehend how business ethics decisions should be arrived at in an organization, and embrace their unique roles as leaders in this regard, and also as critical decision-makers, then there is hope for ethical business and society at large.

INVESTMENT POLICY AND ECONOMIC PERFORMANCE: THE CASE OF ITALIAN LISTED COMPANIES

Ossola, Giovanni; Giovando, Guido; Crovini, Chiara

School of Management, University of Turin, Turin, Italy

ABSTRACT

This study focuses on the investment policy of companies listed on the Italian Stock Exchange in the period between 2007 and 2013.

In particular this research concentrates on the industrial and technological sectors, which have deep differences in terms of internal structure and business strategy. In fact industrial companies are likely to have a rigid structure, while the technological ones are more elastic and dynamic. This element directly influences the overall strategic focus, because technology requires firms to adapt more easily and quickly to the needs of consumers and to the aggressive policy of competitors. These views lead to different kinds of investments. In fact this research starts with the hypothesis that in the industrial sector tangible elements are much more relevant, while in the technological system intangibles are prevalent.

As a consequence, there emerged the curiosity to investigate if the specific type of investments have an impact on the economic performance, in terms of operating margin (EBIT).

This study bases its analysis on trends and relationships between tangibles, intangibles and operating income and they were tested empirically by analyzing the financial data extracted from consolidated balance sheets of all companies of the period between 2007 and 2013 provided by a database, called AIDA.

Using the Pearson correlation ratio, the authors aimed at finding evidence of a hypothetical correlation between tangible and intangible investments and EBIT, in order to verify if they are a direct or an indirect cause affecting the trend of the economic performance.

Keywords: *investments, tangible, intangible, assets, EBIT, listed companies, technological, industrial.*

INTRODUCTION

Intangible and tangible investments do not have the same importance from one industry to another.

The choice of the business in which a company operates is the key that determines its organization and capital structure (Pisoni, Brusa et. al., 1996).

In particular, it means having a clear idea of the product or service to realize, of the market in which a firm wants to compete, of techniques and instruments to be used and of the way strategies are put into practice.

This is the reason why we have decided to focus on Italian listed companies belonging to the industrial and technological sectors, in fact we want to compare and contrast two different situations and understand their investment policy and the related impact on the economic performance.

By starting with the main hypothesis that industrial companies invest more in tangible assets and technological ones in intangibles, our first aim is to study the trend of the two types of investments in the period between 2007 and 2013 in order to monitor if the economic crisis affected these two sectors.

In addition, our research concentrates on the economic margin, related to the core activities of the companies considered.

The third step is to combine these two elements, investments and operating income (EBIT, Earnings Before Interests and Taxes), in order to evaluate if there is a correlation between the two. In particular, this purpose can be demonstrated by the Pearson correlation ratio.

As a consequence the final part of this empirical research is based on the study of the impact of the specific investment policy on the operating income.

The remainder of this study is organized as follows. In Paragraph 1, we provide the theoretical background of the topic presented. The methodology and the definition of the sample of companies is described in Paragraph 2. In this section, we also include the presentation of the research questions and of the phases of analysis. Our results are presented in Paragraph 3 and conclusions in the last part of the research.

1. LITERATURE

The discipline of Business Administration defines the company as a system, composed of many elements which are interrelated (Santesso, 2010; Pisoni, Brusa et al., 1995; Ferrero, 1987). It is a unique system because every single company is an independent entity, with its own internal structure (Amit and Schoemaker, 1993).

As we mentioned in the foreword, defining the specific business in which every firm operates means developing distinctive competences and creating a strategy that allows the company to be competitive on the market (Myers, 2013; Franco and Bourne, 2004).

Several authors based their research on studying the capital structure of companies in order to monitor their impact in terms of competitiveness, value and performance (Lombardi, Manfredi et.al., 2014; Mezentceva and Mezentceva, 2014; Bobillo, Rodriguez-Sanz and Tejerina-Gaite, 2006; Hall, 2001; Dierickx and Cool, 1989).

Other studies decided to concentrate on intangible assets and on the related benefit for a company investing in them (Denicolai, Zucchella and Strange, 2014; Cohen and Vlismas, 2013; Chiucchi, 2013; Heiens, Leach and McGrath, 2007; Casta, Escaffre and Ramond, 2005; Hand and Lev, 2004; Megna and Mueller, 1991; Grabowski and Mueller, 1978). Some researchers decided to analyze the different role of tangible and intangible assets as resources (Galbreath, 2005) and some others concentrated on one sector in particular and to monitor the impact of a specific investment policy (Makris, 2008).

Our analysis fits into this framework but the purposes are different. In fact it is aimed at comparing and contrasting two different situations: the first one represented by technological companies, oriented to an intangible investment policy, and the second one represented by industrial firms, which mostly own tangible assets.

After this first phase, our study goes deeply into the evaluation of the impact of these investments on the economic performance. In this case the economic performance is represented by the operating income (EBIT, Earning Before Interests and Taxes), which is the margin deriving from the company core business activities.

As a consequence our research represents a sort of extension of previous studies above-mentioned because firstly we concentrate on two important sectors in Italy and secondly this study covers a very long period, from 2007 to 2013.

Moreover we also concentrate on tangibles and by making this comparison between the two sectors and consequently between two different kinds of investment policies, we want to monitor the economic results of companies pursuing one policy or another.

Thanks to this analysis and the results obtained, we may consider the opportunities of growth and development of these companies included in the sample. We may notice the differences emerging after deciding to make a particular investment.

2. METHODOLOGY

2.1 The sample and methods

This analysis focuses on two different groups of companies listed on the Italian Stock Exchange.

In particular, we have chosen those listed on the sectoral index called FTSE All-share Industrials, and those listed in another sectoral index called FTSE All-share Technology. The first index includes firms operating in the industrial field, while the second one refer to companies working in the technological sector.

We have decided to concentrate on these two groups because they are extremely different in their structure and in the policy of investments. This difference may help us analyse the trend of the related

investments over the period between 2007 and 2013. Moreover these typical characteristics can help us study if the dynamic of investments can influence the economic performance of these firms.

Data were extracted from AIDA, which is a database containing comprehensive information on companies in Italy.

We used the consolidated balance sheets of all companies and we focused on information about tangible and intangible assets and EBIT (Earnings Before Interest and Taxes).

We want to specify that data provided in our figures all refer to the mean of the single element analyzed for the specific sector.

AIDA provided data of 90 companies out of 93. We had to exclude three firms: Stmicroelectronics, belonging to the technological sector, Cerved Information Solutions and Gruppo Ceramiche Ricchetti, both industrial companies.

Table 1 shows all the Italian limited companies linked to the technological field.

2.2 Research questions and phases of analysis

The present research is based on the following main hypothesis: companies listed on the sectoral index called FTSE All-share Industrials, invested more in tangible assets, while those listed in the sectoral index called FTSE All-share Technology, focused their business on intangibles.

To reach the goals of this study, we need to formulate two research questions:

- RQ1: what are the trends of the specific type of investments in the industrial and in the technological sectors? And what about the EBIT?

- RQ2: Is there a correlation between the specific investment policy followed by each sector, and the related operating income?

The research methodology follows three phases:

a) Phase 1: Definition of the items monitored. As we analyse the annual financial reporting of a group of Italian listed companies, we refer to the IAS-IFRS principles (Dezzani, F., Biancone, P.P. and Busso, D., 2014), and in particular to IAS 1, *Presentation of Financial Statement*, IAS 16, *Property, Plant and Equipment*, IAS 38, *Intangible Assets*, and IAS 40, *Investment Property*;

b) Phase 2: Empirical analysis and findings. It involves an analysis of the information derived from the sample. The research methodology only uses the information provided in the consolidated financial statements because it is sufficient to answer the research questions.

With reference to *RQ1*, we firstly want to demonstrate that the main hypothesis is true. As a consequence, we have to consider the mean of the investments of the specific sector in order to understand what kind of policy is followed by the two groups. Secondly, we monitor the trend of the investments and the EBIT between 2007 and 2013 to underline which group suffered less from the economic crisis. Then we compare the two situations in order to introduce the second research question.

With reference to *RQ2*, for each group of companies, we firstly calculate the Pearson correlation ratio between the tangible investments and EBIT, as regards the industrial field, and between the intangibles and the operating income, for the technological companies. Thanks to this ratio, we can analyse the impact of investments on the overall operating result in order to evaluate the effects of a specific investment policy. The analysis of the correlation between tangible assets and EBIT on one hand, and intangibles and EBIT on the other aims at discovering if there is a strict link between them and, if it is confirmed, how strongly the two are connected.

As mentioned above, the Pearson correlation ratio (p) is used to identify a positive or negative correlation between the specific investments and the EBIT. For this, it is necessary to underline the following conditions:

- if $p > 0$ there is a direct correlation;
- if $p = 0$ there is no correlation;
- if $p < 0$ there is a indirect correlation;
- if $0 < p < 0.3$ the correlation is weak;
- if $0.3 < p < 0.7$ the correlation is moderate;
- if $p > 0.7$ the correlation is strong.

c) Phase 3: Conclusions and limitations of the research.

3. FINDINGS

First of all, before analyzing the data obtained, we want to give further details and definitions.

IAS 38 states that an *intangible asset* is an identifiable non-monetary asset without physical substance. Intangible assets are initially measured at cost, subsequently measured at cost or using the revaluation model, and amortised on a systematic basis over their useful lives, unless the asset has an indefinite useful life, in which case it is not amortised.

The three critical attributes of an intangible asset are:

- identifiability;
- control: power to obtain benefits from the asset;
- future economic benefits, in terms of revenues or fewer future costs.

As regards tangible assets, AIDA provides overall information concerning both investment property and property, plants and equipment. Unfortunately, there is no distinction between the two categories.

Phase 2 concerns the stages of our research and the related comments.

Starting with the RQ 1, figure 1 underlines what kind of investments were made by technological companies during the period between 2007 and 2013. The data refer to the mean of the sector for each year.

Figure 1. *Investments in Italian companies listed on the Technology sectoral Index*

Figure 2 instead shows what kind of investments were made by industrial companies during the same period. The data refer to the mean of the sector for each year.

Figure 2. *Investments in Italian companies listed on the Industry sectoral Index*

The two figures demonstrate that the initial main hypothesis is true. In fact companies listed in the Italian Stock Exchange and belonging to the technological sector invest the majority of their capital in intangible assets, while listed firms related to the Industry index have the tendency to invest in tangible assets.

After individuating the specific policy of investments, we want to focus on the trend of these elements and on the operating income in order to understand first of all if they have the same evolution during the period analyzed.

Figure 3. *The trend of intangible assets and EBIT of companies listed on the Italian Stock Exchange*

Figure 4 instead shows the trend of tangible assets and EBIT during the period between 2007 and 2013 of firms listed on the Italian FTSE All-Share Industrials.

Figure 4. The trend of tangible assets and EBIT of companies listed on the Italian Stock Exchange

As we can see in the two figures, EBIT seems to follow the trend of investments in the technological sector. In graph 3, the only year in which the two items considered diverge is 2010. In fact in technological companies, if the amount of intangible investments remained stable, the operating income decreased considerably.

On the contrary, in industrial companies tangible assets and the operating income do not have the same trend, except in the first two years. In fact, in 2010 tangible assets declined significantly while the operating earnings rose. Moreover in the period between 2010 and 2013 there was the opposite tendency: the investments slightly increased in 2011 and in the last years they decreased, while EBIT first went down and then it recovered slowly.

After a brief comment on the graphs, it is needed to calculate mathematically if there is a correlation between specific investments and EBIT in order to give a statistical explanation to the figures above. We decided to use the Pearson correlation ratio (p) for each sector in the period between 2007 and 2013.

Table 3 shows the ratio in the technological field and the data used are related to the eighteen listed companies of the sectoral index FTSE All-share Technology.

Table 3		The Pearson correlation ratio between intangible investments and EBIT in the technological sector						
		EBIT 2007	EBIT 2008	EBIT 2009	EBIT 2010	EBIT 2011	EBIT 2012	EBIT 2013
	Intangibles 2007	0,16596						
	Intangibles 2008		0,38029					
	Intangibles 2009			0,56367				
	Intangibles 2010				0,27570			
	Intangibles 2011					0,53191		
	Intangibles 2012						0,51307	
	Intangibles 2013							0,66109

Table 3. *The correlation between intangibles and the operating income of the listed companies of the technological sample*

The present table confirms the previous comment on the related two trends of the technological companies. There was a slight correlation in 2010, but also in 2007. In this last case, the result was probably influenced by previous economic strategies, that we do not consider in this analysis. In the other years instead we can notice a moderate correlation, which grew in the last three years.

Table 4, instead, shows the results coming from the combination of tangible assets and the operating earnings of the listed firms, belonging to the sample related to the FTSE All-Share Industrials.

Table 4	The Pearson correlation ratio between tangible investments and EBIT in the industrial sector							
		EBIT 2007	EBIT 2008	EBIT 2009	EBIT 2010	EBIT 2011	EBIT 2012	EBIT 2013
	Tangibles 2007	0,37904						
	Tangibles 2008		0,20474					
	Tangibles 2009			0,22288				
	Tangibles 2010				0,35711			
	Tangibles 2011					0,23780		
	Tangibles 2012						0,15531	
	Tangibles 2013							0,23805

Table 4. *The correlation between tangibles and the operating income of the listed companies of the industrial sample*

Even in this case, the Pearson correlation ratio of each year confirms what we have just commented before. In the industrial field there is no correlation between the investment policy in tangible property and the operating income. Tangible assets did not have a strong impact on the economic result, referring to the core competencies of the sample monitored for the research.

In conclusion, thanks to these data and analysis, we might affirm that in the Italian companies listed on the FTSE All-Share Index intangibles had an impact on the operating margin and consequently on the economic performance, whilst in the companies related to the FTSE All-Share Industrials there was no correlation between tangible investments and EBIT.

Trying to give an explanation to this phenomenon, the operating income can be influenced not only by operating investments, but also by revenues and annual costs (Pisoni and Devalle, 2013; Bragg, 2007; Gibson, 2008).

As a consequence, it is possible that property, plants and equipment may influence indirectly the operating margin through the amount of sales of products or services and the correlated revenues or through a specific cost policy. In this case direct effects are on the output of the specific company. Tangibles are instruments through which, according to the Business Administration theories, the process of industrial transformation "input-output" can be set up (Potito et. al., 2014; Aryasri, 2008).

In addition there is the problem that the data of tangible investments, provided by AIDA, do not distinguish the amount of tangibles classified as property, plants and equipment, which can be used in the production, or as investment property, not related to the core business.

On the contrary, intangibles seem to have a direct impact on the economic result because they can be very valuable for a firm and can be crucial to its long-term success or failure.

4. CONCLUSIONS

Our research with its results confirms what many previous studies stated before: intangibles have achieved a growing importance since the 1990s (Kaplan and Norton, 2004). Nowadays focusing investments on intangible assets means creating a distinctive and sustainable value and being much more competitive on the market because corporate intellectual property, such as patents, trademarks, copyrights, business methodologies, goodwill and brand recognition can directly drive global sales year after year (Amin and Hasan, 2014; Warren, 2000; Zahra, 1999; Winter, 1987; Porter, 1985). In addition sometimes customers do not focus on the product or service, but on the brand: the more popular the brand, the more successful the company. The impact can either lead a company to success or failure.

Thanks to our study we have realized that even in Italy companies belonging to the industrial sector did not have the same good economic performance of the technological ones, nor the same perspective of growth and development. It is much more difficult to create value in a long-term period with only tangible investments. As a consequence, if industrial companies enhance and align intangible assets, they would probably improve their overall performance, satisfying customers' needs and the shareholders' interest in the company.

This last element can help us introduce all the limits of this research. First of all, this study represents the first step of a far deeper analysis that can consider other variables, financial indicators and margins. In addition, the same analysis can be extended to all Italian listed companies, not only to the industrial and technological ones.

It could be interesting to compare and contrast the Italian situation with the one of other European countries, such as France and Germany.

Moreover, as we mentioned before, the database used to extract the financial data of the companies of the sample (AIDA) did not provide information for all the companies.

Another limit is represented by the fact that, as regards tangible assets, AIDA did not give further information about the specific classification of this item. We could not divide property, plants and equipment from investment property. Consequently, we used the comprehensive data without considering which part regards operating investments.

BANKS' GROSS LOANS LISTED ON THE ITALIAN STOCK EXCHANGE

Ossola, Giovanni; Giovando, Guido; Crovini, Chiara

School of Management, University of Turin, Turin, Italy

ABSTRACT

This study focuses on the groups of banks listed on the Italian Stock Exchange.

In particular, we have chosen those listed on the sectoral index called FTSE Banks.

In this group of banks, we focused on the analysis of the Gross loans and the related Reserves for impaired loans in the period between 2005 and 2013. Moreover this study can help us understand the context and the main business in which banks operate.

Data were extracted from a database, called Bankscope, which is a database containing comprehensive information on financial companies (banks and insurance companies) in Italy.

The aim of this study is to monitor the role of Net loans for banks in terms of impact on total assets and, consequently, the trend of the reserves for impaired loans. Then in this research we would investigate also the correlation between the credits and their related Reserves of impaired loans. The Pearson correlation ratio is used in order to find a correlation between the two quantities.

Our research reveals that reserves for impaired loans will be one of the most strategic items of bank balance sheets.

Under these provisions, administrators will influence the income statement of the bank.

Our findings raise important issues on one hand on necessary policy supervision of the banking system and on the other a concern regarding gross loans with a steady increase in impaired loans and ultimately the possibility of mergers between banks for more efficiency policy risk.

Key-words: gross loans, assets, reserves, impairment, banks, Italian Stock Exchange

INTRODUCTION

Banks, like any other business, have been changing continuously with the surrounding environment. In fact, there are several inputs coming from the surrounding environment, such as production factors, constraints and conditions that, through a process of transformation, generate a series of outputs (Ferrero, 1987). Along with insurance, financial intermediaries, banks are part of the so-called

"financial system" (Giovando and Venuti, 2014). The financial system connects the entire economic system through the financial reports (Onado, 2000).

The financial statements of banks presents peculiarities of composition, exposure and content that make it suitable for the specific type of business (Bocchino, 2013).

Indeed the bank balance follows an order of presentation of the items, essentially based on a policy of decreasing liquidity, with cash and cash equivalents reported as the first entry (Giovando and Venuti 2014).

Our research focuses on the analysis of loans. In fact the loans are an essential item of the balance sheet of banks, as being one of the most representative items heavily influencing both stability and profitability of this system.

Periodically, the loans are subjected to verification for possible quality deterioration (impairment), which is understood as a possible loss of value. The reasons and the circumstances in which that may lead to an impairment of the financial asset are indicated by IAS 39 (Busso, 2014).

The procedure of "impairment" requires, therefore, in accordance with the provisions laid down by the supervisory board and in line with the IAS / IFRS, to divide the credits into two large groups: exposures (the so-called "non-performing loans") and those who have not brought individually to objective evidence of impairment (performing loans or "performing").

In this connection there is a specific provision for doubtful accounts in order to show a true and fair view of the same.

Finally, to define the adjustment and the associated loss of value, we proceed by deleting the receivables for which the impairment is considered complete and definitive or devaluing (individually or collectively, depending on the method applied) claims for which it is made necessary rectification.

For these reasons, we want to analyze the amount of loans to customers and their allowances for doubtful accounts of a sample of banks listed on the stock market. The sample chosen is that of all the banks listed on the Italian stock market in the period between 2005 and 2013.

For this reason we have formulated two different hypotheses and in order to analyze the results we used the Pearson correlation ratio.

Finally we explain our conclusions. This research differs from previous studies proposed in the literature in terms of empirical analysis. First of all, the current sample is particularly representative as it includes all the companies of the bank sector, listed on the Italian stock market. In addition, the study was conducted on a part of the financial statements of the banks of the sample and analyzed over a very long period of time.

This analysis allowed us to see the changes in balance sheet items considered and let us follow the evolution that occurred in the external environment in that period. Moreover, in those years there was

a deep global crisis that has particularly affected the financial sector and consequently those companies operating in our market.

There are some limits in this research: first of all we should underline that it is the first phase of a far deeper analysis on the banking system. Moreover Bankscope, the database from which we took the data, did not provide all the information required. This is the reason why we decided to use the mean of each item.

1. LITERATURE

Many studies have been conducted to study the bank in its entirety (Koch, T. and S. MacDonald, 2007; Ossola, 2005; Giovando, 1999; Giovando, 1996). Over the years many scholars have studied the bank account (Bocchino et al 2013; Ossola, 2005) and his performance (Barros et al 2007; Berger, Allen N., 2005; Boubakri et al., 2005) and its financial analysis (Hartvigsen, G., 1992). Some researchers have analyzed the performance of the banks belonging to individual countries (Faisal et al 2015; J. Iqbal, and Raza, G., 2009; Ali, A. and Ansari, I, 2007; Barros Ferreira, and Williams, J., 2007). Recent studies have analyzed the bank in terms of international accounting standards (Dezzani et al 2014) and other specific studies are focused on a thorough analysis of the assets and liabilities of the balance transfer.

In addition other researchers have recently analyzed the impacts of the new capital requirements under Basel III on bank lending rates and loan growth. As a result higher capital requirements, raising the marginal cost of bank funding, have been leading to higher rates (Cosimano, et al., 2011; Elliott, 2009; Laeven, L. and F. Valencia, 2008).

Some studies address the banking entities have faced this moment of global crisis (Crowley, 2015; Costa N.M. and Aaron T., 2013; Avdjie et al 2012; Caprio et al, 2011). Many studies have focused on this period of financial crisis, highlighting the crucial role played by the liquidity risk in the stability of a bank, and more generally in the financial system. Some have tried to locate the perimeter within which identify the financial risk and study of methods for good management, in accordance with the requirements of the Basel (Álvarez, Víctor Adrián, and Adrián Fernando Rossignolo 2015; Angelini, et al. 2011,).

A major study found that the systemically important banks Eurozone during the period 2007 and 2013 are well capitalized with respect to market risks, but what about the risks undercapitalized credit and counterparty (Kahlert et al, 2015).

The accumulation of reserves in the banking system of the United States during the financial crisis has increased concerns that the policies of the Federal Reserve may have failed to stimulate the flow of credit to the economy: banks, apparently, are accumulating funds instead of loan out (Keister and McAndrews, 2009).

Although credit risk is an important factor that financial institutions must cope with the determinants of bank problem, loans have been little studied.

A smaller proportion of studies focused on loans in the bank balance. In particular some scholars employ Granger-causality techniques to test four hypotheses regarding the relationships among loan quality, cost efficiency, and bank capital (Berger and De Young (1997). Other studies analyzed the trade-off between (loan portfolio) focus and diversification using a unique data set that is able to identify individual bank loan exposures to different industries, to different sectors, and to different geographical regions (Acharya et al, 2003). Some studies have analyzed the types of loans to customers and the different types of credit between different regions (Salas and Saurina, 2002).

Important studies has deepened as loan growth affect the riskiness of individual banks in many countries (Foos et al, 2010; Bushman and Williams 2012). The study notes that the loan growth leads to an increase in provisions for credit losses over the next three years, to a decrease in interest income related, and lower capital ratios. Further analysis shows that lending growth has also a negative impact on net interest income risk-adjusted. All this leads to the conclusion that the growth of loans is an important driver of the riskiness of banks.

However, none of these types of analysis was performed to Italian banking firms in the period considered. More specifically, our research considers the period between 2005 and 2013, a very long period that allows to overcome the cyclical trends in the short term, on a large sample of Italian banks, generating incremental results than existing literature from an empirical point of view. Consequently, the results provide a "snapshot" of the economic situation of the banks.

2. METHODOLOGY

The following paragraphs describe the sample and the methodology followed to conduct our research.

2.1 The sample and methods

This analysis focuses on the groups of banks listed on the Italian Stock Exchange.

In particular, we have chosen those listed on the sectoral index called FTSE Banks.

In this group of banks, we focused on the analysis of the Gross loans and the related Reserves for impaired loans in the period between 2005 and 2013. Moreover this study can help us understand the context and the main business in which banks operate.

Data were extracted from Bankscope, which is a database containing comprehensive information on financial companies (banks and insurance companies) in Italy.

We used the consolidated balance sheets of all companies and we focused on information about Gross loans, Reserves for impaired loans and Total Assets of the balance sheet of the groups of banks companies.

We want to specify that data provided in our figures all refer to the mean of the single element analyzed for the specific sector.

Table 1 shows all the Italian banks of the sample analyzed.

2.2 Research questions and phases of analysis

The present research is based on the following main hypothesis: the assets of banks listed on the sectoral index called FTSE banks are mainly represented by loans.

To reach the goals of this study, we need to formulate two research questions:

- RQ1: What is the role of Net loans for banks in terms of impact on total assets? And, consequently, what is the trend of the reserves for impaired loans?

- RQ2: Is there a correlation between the credits and their related Reserves of impaired loans?

The research methodology follows *three phases*:

a) *Phase 1*: Definition of the items monitored. As we analyse the annual financial reporting of a group of Italian listed companies, we refer to the IAS-IFRS principles (Dezzani et al, 2014), and in particular to IAS 1, *Presentation of Financial Statement*.

b) *Phase 2*: Empirical analysis and findings. It involves an analysis of the information derived from the sample. The research methodology only uses the information provided in the consolidated financial statements because it is sufficient to answer the research questions.

With reference to RQ1, we firstly want to demonstrate that the amount of net loans is particularly significant in bank balance sheets. Afterwards we want to monitor their evolution and make a comparison with the percentage of Reserves of impaired loans to the total gross loans in the period considered.

With reference to RQ2, we firstly calculate the Pearson correlation ratio between the Gross Loans and Reserves for impaired loans. Thanks to this ratio, we can analyse the impact of gross loans on the reserves for impaired loans in order to evaluate the effects of a specific gross loans policy.

As mentioned above, the Pearson correlation ratio (p) is used to identify a positive or negative correlation between the gross loans and the reserves for impaired loans. For this, it is necessary to underline the following conditions:

- if $p > 0$ there is a direct correlation;
- if $p = 0$ there is no correlation;
- if $p < 0$ there is a indirect correlation;
- if $0 < p < 0.3$ the correlation is weak;
- if $0.3 < p < 0.7$ the correlation is moderate;
- if $p > 0.7$ the correlation is strong.

c) *Phase 3*: Conclusions and limitations of the research.

3. FINDINGS

First of all, before analyzing the data obtained, we want to give further details and definitions.

The gross loans includes loans, finance leases, factoring transactions, debt securities, the variation margins with clearing in front of derivative transactions and operating receivables associated with the provision of financial services.

The gross loans are initially recognized at fair value which corresponds to the amount disbursed, or subscription price, plus any transaction costs and revenues directly attributable.

At the end of each accounting an assessment is made of the loss of value of the entire loan portfolio.

The amount of the loss is recognized in the income statement.

The evaluation of the impairment loss on the entire loan portfolio is made taking into account these distinctions:

- Non-performing loans (non-performing): this category includes the suffering, substandard loans, restructured loans, loans past due / overdue (Past due), as defined by the applicable regulatory reporting;
- Performing loans (or performing): as for non-performing loans (Excluding past due) assessment, analytically attributed to each individual position, is performed, for loans that exceed the threshold of significance, determining the expected cash flows and the relative timing of receipts.

Phase 2 concerns the stages of our research and the related comments.

Starting with the *RQ 1*, Figure 1 emphasizes the weight of net loans to total assets of bank balance sheets in the period between 2005 and 2013. The data refer to the average of the sample for each year.

Figure 4. *The impact of net loans to total assets*

The figure confirms our main hypothesis, therefore, in the sample of banking firms considered, it can

be noted that the gross loans were a significant part of the total assets.

Moreover there was a direct correlation between the two. In fact when gross loans went up, total assets increased too.

Obviously, the trend of total assets was also influenced by other items such as financial assets, classified as AFS (Available for Sale) or HFT (Held for Trading).

Moreover, despite the crisis in the period between 2007 and 2009, the sample of Italian banks increased its gross loans, in opposition contrary to what happened on the sample of American banks (Keister and McAndrews, 2009).

Figure 2 instead shows the trend of gross loans and reserves for impaired loans during the same period. The data refer to the mean of the sector for each year.

The trend of gross loans and reserves for impaired loans

The two figures demonstrate that the initial main hypothesis is true. In addition, it is important to understand the relationship in the balance sheets of banks between credits and the reserves.

This graph lets us introduce the answer to RQ2. In fact, by analyzing their evolution, we can affirm that the two items were interrelated in the period considered.

We can notice that the reserves gradually increased between 2005 and 2013, while credits did not have the same plain growth. In 2009 the development stopped and then started increasing again, but in 2011 the amount of gross loans began decreasing.

It is therefore clear that in a period of crisis, such as the one that we have been through, banks have increased their reserves for impaired loans and have decided to reduce their risks.

Table 2 shows the percentage of impaired loans to gross loans, referring to the sample analyzed. As we can see, the amount of reserves has increased over the years. In fact it passed from 2.6% in 2005 to 6.4% in 2013.

In particular, in 2008 there was a peak, clearly determined by the general situation of crisis of that year.

Table 2	The percentage of reserves for impaired loans to gross loans									
		2005	2006	2007	2008	2009	2010	2011	2012	2013
	Reserves of impaired loans	2,6%	2,5%	3,3%	4,4%	3,1%	3,4%	3,9%	4,9%	6,4%

Table 2. *The percentage of reserves for impaired loans to gross loans of the banks of the sample*

As mentioned in the previous paragraph, in order to demonstrate the hypothetical correlation between gross loans and their related reserves, we decided to use the Pearson correlation ratio (p) in the period between 2005 and 2013.

Table 3 shows the results deriving from the correlation between gross loans and reserves for impaired loans.

Table 3	The Pearson correlation ratio between gross loans and reserves for impaired loans										
	Gross Loans	Reserves for impaired loans									
			2005	2006	2007	2008	2009	2010	2011	2012	2013
		2005	0,94								
		2006		0,93							
		2007			0,96						
		2008				0,98					
		2009					0,99				
		2010						0,99			
		2011							0,98		
		2012								0,99	
		2013									0,98

Table 3. *The correlation ratio between gross loans and reserves for impaired loans of the banks of the sample*

The present table confirms there is a strong correlation between the two variables. Every year the correlation overcomes 0.9, rising from 0.94 in 2005 to 0.98 in 2013.

Even in this case, the Pearson correlation ratio of each year confirms what we have just commented before.

On one hand the average of the allocations increases over the years and on the other the correlation is very strong.

4. CONCLUSIONS

Our research and its results confirm what many previous studies have stated before: the gross loans are an essential item of the balance sheet reaching in some years a percentage on average more than 50 percent of total assets (Keister and McAndrews, 2012).

Nowadays the balance sheet of banks is formed mainly by that item. But precisely for these reasons reserves for impaired loans have had an increasing importance.

Indeed provisions to reserves for impaired loans reveals that they will be one of the most strategic items of bank balance sheets.

Under these provisions, administrators will influence the income statement of the bank.

Our findings raise important bank supervisory policy issues: the use of bank level variables as early warning indicators.

Thanks to our study, we realized that in Italy in the period between 2005 and 2013 the gross loans of the group of banks considered increased. Moreover the related reserves for impaired loans had the same trend.

As a consequence the crisis of recent years has generated strong concerns regarding gross loans.

This system thus brought to an increase of provisions to reserves for impaired loans.

We have also noticed that the Pearson correlation ratio underlines that the growth of gross loans is strongly correlated to the increase reserves for impaired loans.

The overall situation has also an impact on the topic of bank mergers. Business combination would bring benefits in terms of aggregate credit risk and its management.

What we have analyzed also let us introduce all the limitations of this research. First of all, this study represents the first step of a much deeper analysis that can consider other variables, financial indicators and margins. Moreover, the same analysis can be extended to all European listed banks.

It might be interesting to compare and contrast the Italian situation with that of other European countries, such as England, France and Germany.

Also, it may be useful to understand the impact of the annual provision to reserves for impaired loans on the operating result. This might help better understand the balance sheets of banks throughout this period and how performance in the sector have been influenced by the policy linked to these provisions.

VALUE CO-CREATION AND VALUE CO-DESTRUCTION IN THE PATIENT-PROVIDER RELATIONSHIP. THE CONTRIBUTION OF THE “HEALTH LITERACY” PERSPECTIVE

Palumbo, Rocco

Dept. of Management & Information Technology, University of Salerno, Italy

ABSTRACT

Patient empowerment, patient engagement, patient involvement, and patient-centered care are popular buzzwords in the fields of health policy and health care management. However, in spite of their topicality, still little is known about the issues which concern the involvement of patients as co-producers of health care services and co-creators of value. Besides, most of the scholars are inclined to focus their attention on the intrinsic value-added ascribed to health care co-production, thus overlooking the possibility of value co-destruction which is associated with the engagement of patients in the provision of health care. This paper is aimed at conceptually exploring the ideas of value co-creation and value co-destruction in the health care service system, pointing out a link between the “health literacy” concept and the co-production of health care services. This topic is approached according to a theoretical perspective, with the eventual purposes of shedding light on two important determinants of value co-destruction and inspiring further efforts of research. In particular, value co-destruction is conceived as a two-way street, where both health care providers and patients are involved. Indeed, both of them could accidentally or intentionally contribute in the process of value destruction, undermining the positive outcomes which are usually ascribed to patient engagement. Individual health literacy and organizational health literacy are understood as two crucial tools to enhance the involvement of patients as co-creators of value and reduce the risks of value co-destruction. Adopting this point of view, conceptual and practical implications are drawn, which pave the way for further developments.

Keywords: *Health literacy; Organizational health literacy; Co-production; Value co-creation; Value co-destruction*

INTRODUCTION: THE OPTIMISTIC IDEA OF PATIENT ENGAGEMENT

Patient engagement and patient involvement are generally understood as both crucial policy goals and key managerial priorities to enhance the quality of health services and to improve the

sustainability of the health care system (Durand, et al., 2014; Coulter, 2006). Moreover, the process of patient empowerment is assumed to be imperative to revisit the traditional bio-medical approach to care. Actually, it promotes the reconceptualization of the patient as a co-producer of value, rather than as a consumer of health care services who relies on the support of health care professionals to deal with health-related problems (Fumagalli, et al., 2015). Even though patient engagement is generally described by scholars and practitioners as a multi-faceted concept, which assumes a lot of challenging definitions (Gallivan, et al., 2012), it could be ultimately understood as a process of activation, by virtue of which the patients develop an increasing awareness of the actions they have to take “*to obtain the greatest benefit from the health care services available to them*” (Gruman, et al., 2010, p. 351).

Such an interpretation of patient engagement is consistent with the assumption that health care professionals are only one part of the health care service system. Actually, patients themselves are deeply involved in all the types of activities which concern the protection and the promotion of the health status, thus playing the role of critical “*co-producers of health*” (Coulter, 2012, p. 80). From this point of view – and in line with what Grönroos (2008) has argued dealing with services in general – the process nature of health care provision is emphasized. Consequently, health care professionals are called to perform two complementary functions dealing with the patients. On the one hand, they operate as enablers who have to facilitate the activation of the patients in the provision of health services with the eventual purpose of achieving patient-centered care (Michie, et al., 2003). On the other hand, they serve as catalysts, encouraging the willingness of patients to be involved in the process of health care provision (Thompson & McCabe, 2012).

To the knowledge of the Author, still little is known about the effects of patient engagement on health outcomes, as well as on cost savings. However, several scholars agree in claiming that the involvement of patients in the provision of health care services allows the achievement of significant results, including: the establishment of a safer healthcare environment (Sharp, et al., 2014), the enhancement of the relationships between the health care professionals and the patients (Roseman, et al., 2013), the improvement of the patients’ preference for collaborative decision making (Durand, et al., 2014), the encouragement of patients’ self-management of care (Simmons, et al., 2014; Jordan, et al., 2008), and – last but not least – the advancement of patients’ satisfaction (Manary, et al., 2013).

In spite of the prevailing optimism about the effects associated with the engagement of users as active partners of providers, in the field of service marketing Plé and Cáceres (2010) have argued that the enhanced interaction between them may also result in a process of value co-destruction, which in turn paves the way for a decline of the well-being of those who are directly or indirectly involved in the relationship. Going more into details, co-destruction of value is likely to happen when users and providers participate in the process of service provision adopting different perspectives, bringing

incongruent inputs, and aiming at the achievement of diverging ends (Smith, 2013). In other words, co-destruction of value implies a misuse of the available resources by the providers, the users, or both of them, which could be either accidental or intentional. In the former case, users and providers are not aware that the clash of their interests and/or activities undermines the service value. Alternatively, in the latter case they deliberately struggle to achieve personal advantages.

The risk of value co-destruction is especially high when the provision of health care services is concerned. In fact, the patients usually lack the knowledge, the skills, the experience, and the understanding to be effectively involved in a co-creating partnership with the health care professionals (Teunissen, et al., 2013). In addition, most of the patients are unwilling to be engaged in the provision of health care, due to the condition of physical and psychological weakness which is associated with the illness (Palumbo, 2014). Lastly, patient engagement could produce ethical tensions, since it leads to increased inequity in the access to health care services (Thomson, et al., 2005). At the same time, health care professionals may play a significant role in co-destroying value when they are urged to embrace a patient-centered approach to care. In particular, they could be interested in limiting the involvement of patients in the process of health care provision, in order to avoid their potential loss of control on clinical decisions (Owens & Cribb, 2012). Indeed, most of health care professionals are still loyal to a purely bio-medical approach to care, which is illness-centered and neglects the patients' contribution in the creation of value (Wood, 2012).

This paper is aimed at conceptually exploring the idea of value co-destruction in the provision of health care in the light of a mainly theoretical perspective. For this purpose, a conceptual association between value co-creation, value co-destruction, and health literacy is suggested. It is assumed that the enhancement of individual and organizational health literacy is crucial to implement patient engagement and to achieve health care co-production. Otherwise, when appropriate levels of individual and organizational health literacy are lacking, the involvement of patients in the provision of health care may result in value co-destruction, which negatively affects the well-being of both the users and the providers of health services.

The article is organized as follows. The next section depicts the health literacy concept and distinguishes individual from organizational health literacy. Besides, it points out the role played by both individual and organizational health literacy in enhancing the involvement of patients in the provision of health care. Drawing from these considerations, the third section includes a theoretical framework, which depicts how limited individual and organizational health literacy pave the way for value co-destruction in the health care setting. The fourth section discusses several practical implications: in particular, it identifies the interventions which could help to avoid value co-destruction and to encourage the engagement of patients in the provision of care. In the concluding section some

stimulating insights are worked out, which inspire further conceptual and practical developments.

HEALTH LITERACY AS A REQUISITE FOR HEALTH CARE CO-PRODUCTION

Health literacy is mainly understood as a purely individual trait. In fact, the health literacy concept was originally conceived in terms of “*functional health literacy*” (Parker et al., 1995), which indicates the basic personal abilities to collect and comprehend written and verbal health information (literacy) and to process the numerical data included in the latter (numeracy). Nutbeam (2008) expanded this restricted definition, claiming that health literacy includes both interactive and critical skills. The former consist of the capacity to build familiar and comfortable relationships with the health care professionals, which allow to improve the quality of patient-provider communications and – consequently – to enhance the interpersonal exchange of information. On the other hand, critical competencies include the ability to identify and appreciate the different alternatives available for the purposes of health protection and promotion, which in turn enhances the achievable health outcomes due to increased effectiveness and appropriateness of care.

Blending these perspectives, health literacy has been ultimately depicted as “*the degree to which individuals have the capacity to obtain, process, and understand basic health information and services needed to make appropriate health decisions*” (Baker, 2006, p.878). In the light of this definition, it is evident that individual health literacy is a crucial requisite to engage the patients in a co-creating partnership with the health care professionals, thus encouraging the co-production of health care services. In fact, the scientific literature has widely shown that the individual health literacy skills predict: the patients’ predisposition to the self-management of care (Macabasco-O’Connell, et al., 2011), the adoption of health seeking behaviors (Bourne, et al., 2010), the proper knowledge of the disease (Gazmararian, et al., 2003), the readiness to use preventive services (Scott, et al., 2002), and the appropriate understanding of health information (Chugh, et al., 2009). Therefore, limited individual health literacy hinders the enactment of collaborative relationships between the health care professionals and the patients. People living with poor health literacy skills are unwilling to be engaged in a co-creating partnership with the providers of care, delegating to the latter most of the decisions which concern the protection and the promotion of the health status.

Both scholars and practitioners have paid an increasing attention to the issues associated with individual health literacy. Alternatively, organizational health literacy is a widely overlooked topic (Parker & Hernandez, 2012), whose effects on patient engagement and on the achievement of enhanced health outcomes is poorly discussed (Palumbo & Annarumma, 2014). This circumstance is quite surprising, since the health care organizations host most of the interactions between health care providers and patients, thus serving as the main context for the implementation of health care co-

production. From this point of view, organizational health literacy could be conceived as the ability of health care organizations to *“make it easier for people to navigate, understand, and use information and services to take care of their health”* (Brach, et al., 2014, p. 213). Sticking to this definition, organizational health literacy implies an evolution in the role of health care organizations from relievers – that is to say self-reliant and specialized solvers of ill health status – to enablers – that is to say facilitators of patient activation and involvement in the provision of care.

Brach and Colleagues (2012) suggested ten attributes which are considered to affect the health literacy of health care organizations, thus emphasizing the complexity of the organizational health literacy concept. Going more into details, health literate health care organizations are assumed: 1) to contemplate health literacy into organizational planning and quality improvement; 2) to encourage a leadership which recognizes the importance of health literacy to organizational mission and values; 3) to engage the served population in the design of both information and health services in a perspective of continuous health literacy improvement; 4) to create proper organizational conditions to overcome the stigma associated with limited health literacy; 5) to improve the ability of health care professionals to handle health literacy issues; 6) to consider the needs of individual living with poor health literacy at all points of contact between patients and providers; 7) to provide patients with easy access to health information; 8) to design and distribute easy to understand written, audio, and visual materials, which are tailored to the needs of poor health literate individuals; 9) to improve inter-organizational relationships with the purpose of enhancing the capacity to address health literacy in high-risk situations; and 10) to clearly communicate to poor literate patients the mechanism of health care services' co-payment.

In line with this theoretical framework, Willis and Co-Authors (2014, p. 518) argued that three different types of interventions are key to enhance organizational health literacy: 1) government and policy actions; 2) organizational/practitioner actions; and 3) partnership actions. The first category falls outside the purposes of this article, since it does not concern the immediate interaction between patients and health care providers, while focusing on the interdependencies between the health literacy concept, the health system, the educational system, and other relevant social and cultural systems. Otherwise, both organizational actions and partnership actions are imperative to facilitate the establishment of a co-creating environment within health care organizations. In particular, the former involve: the development of a shared organizational vision about health literacy, the inclusion of a specific health literacy concern in the main policies of the organization, the identification of health literacy champions to foster the organizational commitment to meet the needs of poor health literate patients, and the engagement of health care professionals in the initiatives aimed at the enhancement of organizational health literacy through improved educational initiatives and the reconceptualization

of the traditional bio-medical approach to care. On the other hand, partnership actions include the establishment of collaborative and cooperative relationships between the entities which operate within the health system, to encourage a systemic effort toward health literacy and improve the access to community-based health literacy resources.

Drawing from these considerations, it could be argued that health care co-production is a two-way street. On the one hand, it deeply relies on the willingness and ability of patients to be engaged in the provision of health care as active partners of regular providers; on the other hand, co-production of care requires favourable organizational conditions, which are vital to the establishment of a co-creating environment in traditional health care settings. When either individual health literacy, organizational health literacy, or both of them are missing, the ambition to involve the patient in the process of health care provision is undermined. Actually, in these circumstances the relationship between the health care providers and the patients is biased, paving the way for value co-destruction rather than value co-creation.

Value co-creation and co-destruction in health care provision

The risk of value co-destruction is especially significant within the health care service system, where the process of service provision is the result of the interaction of agents who bring different perspectives when dealing with health-related phenomena. In fact, patients adopt a first person perspective, since they immediately perceive the fall of the psychic and physical well-being associated with the illness. Alternatively, health care professionals are likely to endorse a third person perspective, appreciating health issues in technical and reductionist terms. Therefore, patients and health care professionals may express diverging ends and conflicting beliefs, which in turn hinder the establishment of a co-creating partnership.

When conflicts between them arise and disagreements are not properly handled, patients and health care providers are likely to co-destroy value, undermining both the effectiveness and the appropriateness of care. Drawing from the conceptual framework arranged by Plé and Cáceres (2010), patients and health care providers are understood as two complementary service systems, which interact and share material and non-material resources for the purpose of service provision. Obviously, the misuse of available resources by either patients, health care providers, or both of them undermines value co-creation, paving the way for the achievement of deficient health outcomes and impoverished well-being. According to what has been shown above, inadequate individual and organizational health literacy are important determinants of resource misuse, engendering a process of value co-destruction.

Patients living with marginal health literacy skills are likely to not properly use their own resources, as well as the assets of health care organizations, thus deeply affecting the appropriateness of health

care. In fact, inadequate functional health literacy jeopardizes the patients' understanding of diagnoses and treatments suggested by health care professionals. As a consequence, it hampers medication adherence, undermines patients' compliance, and discourages the convenient utilization of health care resources (with regards to these particular issues, see among the others: Franzen, et al., 2014; von Wagner, et al., 2007; Institute of Medicine, 2004; Williams, et al., 1995). Besides, poor interactive health literacy prevents the opportunity to fill the cognitive gaps which are produced by inadequate functional skills by leveraging on the establishment of clear relationships with health care providers. In fact, impaired interactional health literacy restrains the individual ability to extract meaningful health information from the multiple communications they establish with health care providers or other sources of health information, thus frustrating the individual ability to navigate the health system (Devraj, et al., 2015; Dalrymple, et al., 2004). Lastly, limited critical health literacy involves patients' poor awareness about health-related phenomena, concurring to reinforce their unwillingness to participate in critical dialogue with health care professionals and to become involved in decision making for health in line with a patient-centered model of care (Heijmans, et al., 2015; Sykes, et al., 2013).

In sum, limited individual health literacy sets the condition for a biased relationship between health care providers and patients. In these circumstances, the involvement of the patient in the provision of health care paves the way for unexpected consequences, including the exacerbation of the patients' health conditions and the related increase in the demand for care. Actually, poor health literate patients are not able to navigate the health system, thus being exposed to higher risks of inappropriateness. Therefore, the process of value co-destruction engendered by limited individual health literacy does not solely concern the fall in the individual well-being. It also implies increased health care costs, with subsequent drawbacks on the sustainability of the health care system. This process of value co-destruction is mainly accidental, since it is produced by the impaired capacity of patients to handle complex health related phenomena and to adequately interact with the providers of care (for the sake of the argument, see Robertson and Colleagues, 2014). Besides, several scholars have argued that the engagement of patients with poor health literacy skills increases their dependency from the support of providers, turning out to be counter-productive (Schulz & Nakamoto, 2013).

However, in most of the cases value co-destruction in the health care service system is produced by inadequate organizational health literacy. In fact, health care organizations are usually unable to establish an environment which empowers patients and enables them to operate as co-producers of health, since the traditional bio-medical model of care is still prevailing. It emphasizes the role played by providers in dealing with the biological determinants of health, thus overlooking the contribution of patients in the success of health care provision. Poor health literate health care organizations neglect

that the patients need the establishment of a friendly and comfortable environment to be effectively involved in the provision of health care. As a consequence, when the enhancement of organizational health literacy is missing, patient engagement turns out to be harmful for both patients and health care professionals. On the one hand, the former may suffer from an increased dependence on the latter, since health care professionals maintain their control on health information, while patients are not able to handle the complex issues which arise in the health care setting. On the other hand, organizational and time constraints hinder a patient-centered approach to care by health care providers, who maintain a bio-medical slant (Légaré & Witteman, 2013).

The poorer the levels of organizational health literacy, the higher the risks of value co-destruction in the health care service system. Limited organizational health literacy implies the arrangement of a hostile environment, where information are not easy to understand and inadequate attention is paid to the information needs of people living with low functional, interactional, and critical health literacy skills. From this point of view, poor organizational health literacy could be understood an intentional determinant of value co-destruction in the health care service system. Actually, the lack of organizational efforts aimed at enhancing the capacity of patients to properly handle the available health resources and at encouraging health care professionals to engage patients in the provision of health care is the result of a voluntary managerial approach, which favours the traditional bio-medical model of care and prevents the transition toward the empowerment of patients as critical co-producers of health.

Figure 1 provides a graphical synthesis of what has been discussed above. Health care co-production entails a revisited relationship between health care professionals and patients, which emphasizes the role played by both of them in the success of health care provision and in the achievement of the desired health outcomes. It rejects the still prevailing bio-medical approach to care, which maintains that health care professionals are the sole relevant agents in the process of health care design and delivery, identifying the patients as mere consumers of health care who are not able to affect the way the service provision is implemented. Quite the opposite, patients are assumed to have a lot of dormant assets, which are generally disregarded in the health care setting. Hence, the lack of co-production implies the inability to benefit from these sleeping resources, negatively affecting value creation.

The engagement of patients in the provision of health care is eventually aimed at activating these sleeping resources, allowing them to participate in the decisions and initiatives which concern health protection and promotion in a perspective of enhanced value co-creation. However, in most of the cases the attention is focused on the institutional conditions which paves the way for patients' empowerment, while the practical requisites of patient involvement are neglected. As it could be

figured out from the above discourse, individual and organizational health literacy are two key determinants of patients engagement. On the one hand, individual health literacy affects the ability of the patients to collect, process, and understand health information, thus influencing their capacity to navigate the health system. On the other hand, organizational health literacy could be understood as an enabling factor: it involves the establishment of a favourable environment to patient involvement, inciting recipients of care to actively take part in the process of value co-creation.

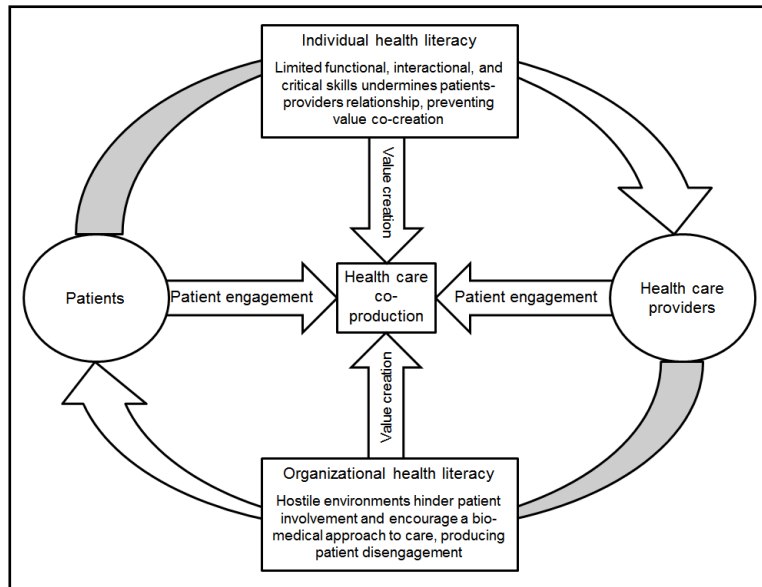

Figure 1. *The process of health care co-production.*

Inadequate individual health literacy undermines value co-creation and produces poor self-management of care and low self-efficacy perception, which in turn frustrate the establishment of collaborative relationships between the patients and the providers of care. Besides, a poor health literate health care setting impairs the ability of the patients to handle complex health-related phenomena and produces increased risks of misuse of the available resources. Therefore, limited individual and organizational health literacy set the conditions for value co-destruction in the health care setting. On the one hand, marginal individual health literacy prevents the ability of the patients to effectively communicate with the health care professionals and to achieve self-management of care. On the other hand, inadequate organizational health literacy hinders a co-creating partnership between the patients and the providers of care, even when the latter have adequate functional, interactive, and critical skills. In fact, it implies the establishment of a hostile environment, which discourages patient engagement. Besides, the mix of adequate organizational health literacy and poor individual health literacy may be harmful: it paves the way for significant risks of resources misuse, due to the inadequate understanding of health information by poor health literate patients.

AVOIDING VALUE CO-DESTRUCTION IN HEALTH CARE SETTINGS

Individual and organizational health literacy are conjoined twins: both of them are required to realize patient engagement and to enhance the value which is generated through the involvement of users in the design and delivery of health care services. As it could be argued from the theoretical framework which has been depicted in the previous section, the disregard of either individual health literacy, organizational health literacy, or both of them in promoting the establishment of a co-creating partnership between the patients and the providers of health care produces momentous drawbacks. It impairs the contribution of patients in the process of health care provision and incites health care professionals to reiterate the traditional bio-medical approach to care, which is illness-centered and considers patients as mere consumers of health care services. As a consequence, it could be assumed that the lack of efforts aimed at addressing individual and organizational health literacy paves the way for value co-destruction, undermining the well-being of the entities involved in the provision of care and jeopardizing the sustainability of the health care system.

In spite of these considerations, scholars and practitioners are used to deal with individual and organizational health literacy as unrelated issues, thus neglecting the significant interdependencies which exist among them. Therefore, still little is known about the overall impacts of inadequate health literacy on both the health outcomes and the sustainability of the health care system. As well, most of the evidences which support the effectiveness of the interventions aimed at improving individual health literacy may be considered unreliable, since they do not appreciate the role played by organizational health literacy in affecting, on the one hand, the engagement of the patients in the provision of health care and, on the other hand, the willingness of health care professionals to perform as enablers of the patients' sleeping resources, thus dismissing their traditional role of healers and illness relievers.

To achieve enhanced conditions of value co-creation within the health care service system, individual health literacy and organizational health literacy should be jointly managed and harmonized each other. With regards to individual health literacy, the ability of patients to understand health information and to properly navigate the health system is crucial to the effective establishment of a co-creating partnership in the health care setting. In fact, poor health literate patients are not able to deal with complex health-related phenomena, are not willing to set up a fair and unbiased relationship with the health care professionals, and are not proficient in discriminating between the *pros* and *cons* of different health treatments available. Hence, specific interventions aimed at educating patients in health-related issues and enhancing their self-efficacy perception are imperative to encourage patient involvement and to realize the value-added which is apparently associated with the co-production of health care. In these words, the patient-provider relationship turns out to be a contact between two

experts, where both of them contribute in the success of the health care provision.

Notwithstanding, the improvement of individual health literacy could be trivial if not supported by the advancement of organizational health literacy. Actually, when the importance of health literacy to organizational mission and values is overlooked and health literacy concerns are not contemplated into organizational plans and goals, health care professionals are not incited to promote patient engagement in the provision of care, thus preserving their loyalty to the traditional bio-medical approach to care. Therefore, within poor health literate health care organizations, the functional, interactive, and critical health literacy skills of patients are sterilized. Although health literate patients are able to participate in the process of value creation, they are restrained to do so due to a hostile environment, which fosters a “fix-it” approach to care and hinders the involvement of patients in the provision of health services. When these circumstances prevail, there is a high risk that value is co-destroyed: the disengagement of the patients implies impaired medication adherence and increased disagreements with the health care providers, which in turn engender the misuse of the available resources and the achievement of meager health outcomes.

From this point of view, the enhancement of organizational health literacy is a crucial part of the initiatives aimed at the engagement of patients, requiring both strategic and managerial changes. First of all, health literacy should be contemplated within organizational planning, being conceived as one of the main strategic concerns of health care organizations. As well, appropriate measures to check the levels of organizational health literacy should be arranged and monitored, informing corrective actions when patients are found to be not able to navigate the health care service system, because of the complexity of health information and the hostility of the health environment. Particular attention should be also paid to the encouragement of inter-organizational relationships within the health care system, with the purpose of improving the access of both patients and health care professionals to community-based health literacy resources, which in turn allow to reduce the risks of misuse of available assets. Last but not least, the sensitivity to health literacy of health care professionals should be aroused, making them more willing to engage and empower the patients.

CONCLUSION AND FURTHER DEVELOPMENTS

Dealing with health care co-production, individual and organizational health literacy are the two faces of the same coin. Both of them affect the relationship between the patients and the providers of care, setting the conditions for the establishment of a co-creating partnership in the health care environment. Nonetheless, dealing with patient engagement, the scientific and the professional literatures have widely overlooked the role played by organizational health literacy, mainly focusing on the individual ability of patients to collect, process, and understand health information in order to

properly navigate the health care system. In addition, even though the awareness of the scholarship about the characteristics and the effects of organizational health literacy is currently arising, still little is known about its impacts on patient empowerment and health care co-production.

The theoretical framework suggested by this paper is aimed at nourishing the debate about this important issue, conceiving individual and organizational health literacy as conjoined twins and emphasizing the interdependencies between them. They are assumed to be crucial to the implementation of health care co-production. The missing of either individual or organizational health literacy paves the way for a biased relationship between the health care providers and the patients, thus preventing the establishment of a co-creating partnership and engendering increased risks of value co-destruction. Further conceptual and empirical developments are needed to figure out the complex interdependencies existing between individual health literacy, organizational health literacy, and health care co-production, clarifying how they interact enhancing value co-creation or provoking value co-destruction.

WILL NEW TECHNOLOGIES CHANGE THE SHOPPING EXPERIENCE AS SOCIAL ACTIVITY?

Pantano, Eleonora¹; Verteramo, Saverino²

¹Department of Marketing, Tourism and Branding, Middlesex University London, UK

²Department of Mechanical, Energy and Management Engineering, University of Calabria, Italy

ABSTRACT

This paper focuses on the effect of the disruptive innovations held by the advanced technologies introduced into the points of sale. In particular, it investigates the new sense of sociality elicited by the integration of advanced technologies and social networks, with emphasis on the sense of sociality and on the quality of social interactions while shopping. The study is based on a quantitative analysis involving 331 young consumers, investigated through the Structural Equation Model. Findings show the extent to which these technological innovations are able to replace the traditional face-to-face interactions (including consumer-to-consumer and consumer-to-vendor ones).

Keywords: *retailing, consumer behaviour, social experience, shopping experience, technology management.*

INTRODUCTION

In recent years, a huge number of advanced systems have been introduced into the physical points of sale for improving retail process (Pantano, 2014). These innovative technologies provide novel, interactive, and entertaining interfaces for displaying products and advertisements (i.e. promotions, manufacturing process, location, etc.), enhancing self-services (i.e. especially grocery stores introduced automatic cash desks to shorten lines), etc., by changing the way for asking and accessing information, achieving and delivering services (i.e. automatic payment based on consumer's own mobile), creating value, purchasing products, etc. (Demirkan and Spohrer, 2014). These innovations might also have a disruptive aspect in terms of consumer-to-consumer and consumer-to-vendor relationships. In fact, they might change/replace/substitute the role of the vendor, since they do not require any direct employees' assistance. Similarly, the growing interest in social networks as informative source shows the extent to which consumers are willing to gather information without physical contacts with others (Godes and Mayzlin, 2004; Pantano and Migliarese, 2014).

Hence, the advanced systems offer a new computer (technology)-mediated retail environment, which integrates interpersonal interactions (consumer-to-consumer and consumer-to-vendor interactions) and machine-based interactions (human-to-computer interactions). Since frontline salespersons determine the first impression consumers have of the retailer (in terms of both brand and firm) in consumers' mind and the consumers start relationships with vendors for achieving benefits (social, psychological, economic and others emerging from the customized relationship) while reducing the risk involved in the purchase process, the sense of sociality involved in the in-store shopping experience might change due to the new benefits, impressions and functionalities provided by these technologies. Although past studies underlined the ability of vendors to persuade people to buy, and the difficulty for a technology to perform adaptive selling like a (real) salesperson (Sharma, 2001; Pantano and Migliarese, 2014), the current systems offer new consumer-to-vendor computer-mediated interactive relationships, where the vendor may be replaced by a virtual system with the main functionality of recommending products on the basis of past purchases and accessed information.

For these reasons, we believe that it is an apt time to revisit the sense of sociality involved in shopping experience for a nuanced study of how the sense of sociality involved in the traditional shopping experience can be dramatically modified by these technologies, with emphasis on the social interactions between consumers and (physical) vendor and consumers and other (physical) consumers. Hence, the aim of this research is to investigate to what extent computer-mediated relationships may replace the traditional human interactions in the physical points of sale, by focusing on a quantitative analysis involving 331 youth (between 20 and 30 years old).

THEORETICAL BACKGROUND

While analysing in-store consumers' behaviour, attention should be paid also to social interactions. Past studies recognized the interpersonal interactions between clients and vendors as determinant of clients' satisfaction, loyalty and subsequent purchasing behaviour (Yang, 2013; Drollinger & Comer, 2013). Hence, consumer-to-vendor relationships play a critical role for the successful of sales, by forcing scholars and practitioners to investigate the ripple effects of advanced technologies on these relationships.

Some preliminary researches in this direction investigated how the self-service systems mediate the traditional communication between consumer and seller (Williams et al., 2012), by showing to what extent building (strong) relationships with consumers becomes more difficult if consumers exploit the self-service technologies, with negative consequences for the quantity and frequency of interpersonal contacts with vendors (Tang et al., 2001; Pantano and Migliarese, 2014). Hence, consumers' preference

to ask physical vendors to ask support might affect their attitude towards the usage of advanced technologies, which may substitute some tasks usually executed by humans (Yang, 2013; Drollinger & Comer, 2013; Pantano and Migliarese, 2014). Thus, if consumers choose technology as supporting tool for shopping, they may perceive as useless the presence of a real vendor.

For these reasons, we hypothesize:

H1: Consumer's relationship with (real) vendor influences his/her attitude towards the usage of a certain technology as supporting tool while shopping.

Moreover, consumers' shopping experience has been largely recognized as an activity that strongly includes the social dimension, by considering all the social interactions (i.e. with both sales personnel and other shoppers) (Gilboa and Vilnai-Yavetz, 2013; Kim and Kim, 2012). The social factors involved in the shopping activity are some of the most important elements related to the in-store store experience (Kourouthanassis et al., 2007; Kim and Kim, 2012). For this reason, one key aspect of the points of sale lays on their ability to offer also a social experience (Gilboa and Vilnai-Yavetz, 2013). The social dimension related to the face-to-face interactions with others, according to Maslow's (1954) definition of the social need of belonging that includes the desire to be accepted by others and meet others' expectations, explains the need to interact with others during the purchase decision. In fact, during the shopping activity, the consumer might buy items for being accepted by the social reference group, where the purchasing of a good consists of the acquisition of a status or a certain identity (Reinstaller and Sanditov, 2005). Thus, he/she is prompted to ask suggestions and opinions for making a better choice, concerning both the technical characteristics of the products and the related social value (Reinstaller and Sanditov, 2005; Li, 2013). The request for recommendations might consist of face-to-face questions, which includes the physical presence of other consumers (e.g. friends/relatives/partners/etc.) in the store, or it might exploit the digital media, which includes an interaction mediated by Internet (i.e. request via social media like Facebook). The ability of vendors to satisfy consumers' requests, suggest product, and support their buying decision might limit their need to be supported by others while shopping (including their need of friends' physical presence).

Therefore, we hypothesize:

H2: Consumer's relationship with (real) vendor influences his/her need of friends' (physical) presence

H3: Consumer's need of friends' (physical) presence affects their attitude towards the usage of advanced technologies while shopping

In this scenario, word-of-mouth (WOM) communication plays an important role for generating awareness and interest towards a certain product, as well as for supporting the subsequent effective purchase (Litvin et al., 2008; Lim and Chung, 2011). WOM is an informal and low cost way of communication, largely used by consumers for achieving and sharing information, as well as for communicating past experiences (Lim and Chung, 2011; Hornik et al., 2015). Thus, it can be seen as a form of information search, which may take place while consumers search for information from others before choosing (Gilly et al., 1998). Information emerging from this interaction adds new knowledge to what consumer already believes on certain features of products and services (Lim and Chung, 2011). Hence, opinions of others impact the individual decision-making process, negatively or positively, by reducing or increasing the perceived credibility of the product/firm according these judgements (Hornik et al., 2015). Managers may exploit this kind of communication for understanding the products/firm's success from the related word-of-mouth that it generated (Godes and Mayzlin, 20014). While WOM takes place between individuals with a sort of pre-existing personal relationship, the electronic channels and social networks overcome this limit by offering a free and always available space where people can interact each other without a previous relationship, access to others' past experience concerning a certain product or firm, ask for information and recommendations, etc., by developing a new form of WOM mediated by the electronic channel, the electronic WOM (or eWOM) (Litvin et al., 2008; Di Pietro et al., 2012). From a marketing perspective, eWOM allows firms to disseminate products, interact with consumers and understand market trends, acceptance and popularity. This acquires importance due to the consumers' perception of eWOM messages as trustworthy sources (Tran et al., 2012). In the choice of unknown product this element is even more evident, when consumers feel motivated to ask suggestions through social networks, like Facebook, for reducing the risks involved in the purchasing process. For this reason, previous authors consider the function of eWOM as a sort of informational social influence (Di Pietro et al., 2012).

The reason for extensive usage of social networks, like Facebook, might also place on the need of social interactions (relationships-oriented motivation) (Cao et al., 2013). Since eWOM keeps in touch past and potential consumers, by advising them and influencing their purchasing decision, with impact on product sales (Di Pietro et al., 2012), and the ways people are linked each other through social networks are several (i.e. for maintaining existing social ties, to be part of an interest group, etc.), eWOM includes accepting suggestions and opinions (either negative or positive) from also individual(s) who may not have been met before without further investigations.

The relationships with vendor may further discourage consumers to ask more information through Internet, by considering the ones provided by the salesperson as enough for the choice. Similarly, the

large exploitation of online advices (eWOM) might affect consumers' attitude in using advanced technologies from the store for achieving suggestions and information from friends.

Therefore, we hypothesize:

H4: Consumer's relationship with (real) vendor influences his/her need to use eWOM for achieving more information and suggestions

H5: Consumers' need to use eWOM for achieving more information and suggestions has a direct influence on their attitude towards attitude towards the usage of advanced technologies while shopping

Consumers need to perceive the collected information as trustworthy to take them into account while choosing. For this reason, trust has attracted researchers' attention and has been frequently integrated into the Technology Acceptance Model (Davis, 1989) as predictor of consumers' acceptance of a certain technology (Pavlou and Fygermson, 2006; Perea y Monsuwé et al., 2004). In fact, trust plays a critical role under conditions of uncertainty and risk, such as during the purchasing of not familiar (or unknown) products (Perea y Monsuwé et al., 2004; Park et al., 2012). In traditional (offline) stores, the most important source of trust is the vendor, by including his/her experience, expertise, honesty, benevolence, confidence, and communication skills (Perea y Monsuwé et al., 2004). The value of trust is fundamental for the stability and duration of consumer-vendor relationships. Although previous studies stated trust as a generalized expectancy from an individual to another (Perea y Monsuwé et al., 2004), in technology-mediated environments where the salesperson is replaced by a system the trust in technology acquires critical importance for the commercial transaction to be successful. In fact, if the technology is trustworthy, consumers may are not willing to ask others' support while choosing.

For these reasons, we hypothesize:

H6: Trust in the technology affects consumers' need to use eWOM for achieving more information and suggestions

H7: Trust in the technology has a direct impact on consumer's relationship with (real) vendor

H8: Trust in the technology influences consumer's need of friends' (physical) presence while shopping in the store

H9: Trust in the technology affects consumers' attitude towards the usage of a certain technology as supporting tool while shopping.

In spite of the huge amount of studies on the role of eWOM and trust for influencing consumer's decision-making process (Bhattacharya and Saha, 2004; Di Pietro et al., 2012; Rafiq et al., 2013), there is

still a limited number of research on the combined role of these factors (relationship with vendors, eWOM, need of friend's presence, trust in technology and attitude) into the emerging technology-enriched retail environment. Thus, this new environment raises new questions that need to be addressed: (i) to what extent do these technologies reduce the face-to-face interactions (both consumer-to-vendor and consumer-to consumer ones)? and (ii) to what extent do the identified factors push this replacing?

The aim of the paper is to provide new insights for answering to these incipient critical issues.

RESEARCH METHODOLOGY

Research model

The variables arising from the literature analysis are the relationship with vendors, electronic word-of-mouth communication (eWOM), need of friends' (physical) presence while shopping, trust in technology, and attitude (towards the use of technologies emerging from integration of social networks within physical points of sale); while the hypothesized research model is presented in Figure 1:

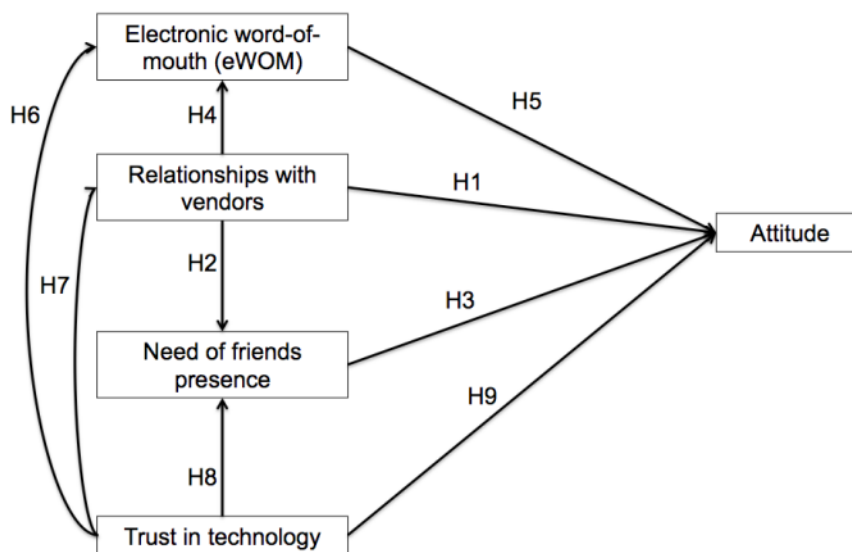

Figure 5. *Research model.*

Sample and procedure

A questionnaire was developed based upon the literature review. The final questionnaire includes 19 items, 14 items on relationships with vendors, electronic word-of-mouth (e-recommendations by friends), (physical) need of friend's presence while shopping, trust in technologies, such as social networks and Facebook, and attitude towards the use of new communication technology emerging from integration between social networks and physical points of sale, which were measured through a

five-point Likert scale (from 1= strongly disagree to 5= strongly agree); and 5 items on consumers' demographics including gender, ownership of a smartphone (including iPhone, etc.), experience on Facebook, frequency of connecting to Facebook, and frequency of connection to Facebook from the (physical) point of sale.

The current research involves the structural equation model (SEM) for testing the research the hypothesized relationships through a confirmatory analytical technique, while both hypotheses test and the factor analysis are valuated in the same analysis through the LISREL statistical software for the covariance-based SEM.

A total of 331 respondents have been recruited in few stores in Southern Italy between December 2014 and February 2015, when they were invited to fill the questionnaire. These participants were volunteers and were between 20 and 30 years old.

Table 1 shows the sample characteristics.

Measure	Item	Percentage
Gender	Male	30%
	Female	70%
Ownership of smartphone	Yes	70%
	No	30%
Experience on Facebook	Less than 1 month	6%
	Till 1 year	7%
	From 1 to 3 years	26%
	More than 3 years	60%
	<i>missing</i>	1%
Frequency of connecting to Facebook	Never	7%
	Once per week	7%
	2-3 times per week	16%
	At least once per day	70%
Frequency of connecting to Facebook from a (physical) point of sale	Never	70%
	At least once	18%
	Often	9%
	Always	2%
	<i>missing</i>	1%

Table 4. *Sample characteristics.*

Although the majority of respondents has a smartphone (70%) and has huge experience on Facebook (26% has a profile from more than 1 year and the 60% from more than 3 years, while the 16% connects

to the social networks 2-3 times per week and the 70% at least once per day), the majority of respondents (70%) never connected to a social network from a physical point of sale (only 18% connected at least once from the store, 9% connected often, while 2% connected always). Hence, consumers make a large use of Facebook, but not actually from the point of sale. A justification might lay in their still limited usage of Internet for asking suggestions to friends in real-time (whereas it is largely used for asking opinions from home).

Main findings

Each variable has been investigated through the Cronbach's α statistical analysis. Since each measure overcomes the suggested value (Cronbach and Shavelson, 2004), the proposed model achieved acceptable construct reliabilities (Table 2).

Constructs	Cronbach's α
relationship with vendors	.820
electronic word-of-mouth communication (eWOM)	.809
(physical) need of friends' presence while shopping	.811
trust in technology	.778
attitude	.847

Table 5. Cronbach's α values for the constructs of the research model.

The statistical validity of the constructs and their relationships have been further investigated by evaluating the fit indexes assessing the quality of the results. In particular, the following goodness-of-fit statistics values emerge from the analysis: $\chi^2/\text{degrees of freedom} = 1.21$, $p = .00$, GFI (goodness-of-fit-index) = .963, AGFI (adjusted goodness-of-fit-index) = .941, NFI (normed fit index) = .962, CFI (comparative fit index) = .992, and RMSEA (root mean square error of approximation) = .026. Since each fitness measure overcomes the ones suggested by literature (Bagozzi and Yi, 1988), the model yields a suitable fit. Subsequently, the hypotheses test has been performed through the analysis of the path coefficient, t-value and R^2 value. The results support all the hypothesized relationships among the research variables, as summarized in Figure 2. Also these findings confirm the good fit of the model.

Figure 6. Structural equation analysis results.

An important trait of our model concerns the main role of trust in technology and the subsequent consumers' attitude towards the usage of the system. While the results show also the moderating role of relationships with vendors on attitude and eWOM, and of eWOM on the trust in technology; the trust in technology has only a limited impact on the need of friends' (physical) presence while shopping. As a consequence, the relationships with the vendor are able to influence both the usage of technology and the need of being with friends while shopping for achieving more information and opinion before purchasing.

Hypothesized relationships	Path coefficient *	t-value*	Test result
H1 Relationships with vendor → Attitude	.32	5.05	Supported
H2 Relationships with vendor → Need of friends presence	.21	5.05	Supported
H3 Need of friends presence → Attitude	.20	2.98	Supported
H4 Relationships with vendor → eWOM	.33	5.13	Supported
H5 eWOM → Attitude	.28	4.45	Supported
H6 Trust in technology → eWOM	.32	5.00	Supported
H7 Trust in technology → Relationships with vendor	.21	3.12	Supported
H8 Trust in technology → Need of friend presence	.13	2.83	Supported
H9 Trust in technology → Attitude	.60	11.55	Supported

Table 6. Tested hypotheses results ($p < .00$).

DISCUSSION AND IMPLICATIONS

Our findings underline the validity of the hypothesized model and of the involved relationships among variables. In particular, it investigates the role of consumers' relationships with vendors and friends while shopping, while new technologies mediate the traditional human interactions. It extends the previous studies on the effects of advanced technologies on consumer-vendor relationships (Sharma,

2001; Tang et al., 2001; Williams et al., 2012; Pantano and Migliarese, 2014), by considering simultaneously all the social relationships (including consumer-to-consumer interactions).

In particular, results underline the role of the relationships with vendor, and the trust in technology on the need of friends' (physical) presence while shopping, as it permits potential clients to achieve suggestions and recommendations able to support their purchasing decision. Hypothesis H1, which states a causal positive relationship between the interaction with vendor and the attitude towards the usage of this new technology is strongly supported, with a standardized coefficient of .32 and t -value = 5.05, while the high value of R^2 indicates that at least 0.631 of variance is explained, by excluding the presence other latent variables. Similarly H2 and H4, which assume a positive causal relationship between interaction with vendor and need of friends' (physical) presence while shopping, and on eWOM are supported with a standardized coefficient of .21 and t -value=5.05, and .33 and t -value= 5.13 respectively. The need of (physical) friends' presence while shopping has also a direct impact on the attitude, with a standardized path coefficient of .20 and t -value= 2.98, while $R^2 = .42.77$ explains most of the variance and excludes the presence of other external variables. EWOM has also a direct impact on the attitude (H5), with path coefficient of .28 and t -value= 4.45. This construct is further supported by the value R^2 , which explains the 23.44% of the variance. Similarly, H6, H7, H8 and H9, which assume a direct casual relationships between trust in technology and eWOM (H6), and relationship with vendor (H7), and need of friend' presence (H8), and attitude (H9), are supported with a standardized coefficient of .31 and t -value= 5.00, .21 and t -value= 3.12, .13 and t -value= 2.83, and .60 and t -value=11.55 respectively, while while $R^2 = .26.59$.

The results show the greatest impact of the trust in technology on the attitude towards its usage, in accordance with past studies (Pavlou and Fygermson, 2006; Perea y Monsuwé et al., 2004; Ha and Stoel, 2009), whereas the trust in technology has only a limited impact on the need of friends' physical presence while shopping.

Findings show the extent to which these technologies might replace the traditional face-to-face interaction between consumers and vendor, and consumers and other consumers. Shopping is a complex, collaborative and social activity (Gilboa and Vilnai-Yavetz, 2013), by requiring a strong effort in consumers' decision making-process. Hence, new technologies based on the integration of social networks into the physical points of sale affect consumers' interaction with both vendors and friends, by giving consumers the possibility to be in touch with all friends and asking their opinion concerning the possible purchase in real-time without a direct face-to-face assistance. In this way, they do not need to ask for vendors' opinions. Similarly, they do not need the physical presence of friends for suggestions. Although the number of consumers who actually access social networks for asking

suggestions directly from the point of sale is still limited (70% never connected to a social network from a physical point of sale, 18% connected at least once, 9% connected often, while 2% connected always), the usage of social network from home is high, as well as the diffusion of smartphone among youth. Hence, the spread of free Internet access from stores would provide consumers the possibility to exploit eWOM directly from the store, by substituting the support of physical vendor or physical friends. As a consequence, the trend is to shift the face-to-face interactions to a computer-mediated interaction, where consumers interact each other through mobile devices without the direct vendor assistance. In this emerging scenario, the technological innovations tend to limit the influence of the real vendor in the decision-making process, who is not allowed to longer influence the purchase of certain products. Furthermore, consumers will diffuse the products throughout the social networks directly from the point of sale by increasing their popularity, with negative consequences, if consumers will share negative comments (Hornik et al., 2015), which the retailer will be not able to immediately check and manage properly.

The consequences for the sense of sociality involved in shopping experience lay in the human-computer interaction, which will link the shopping to social networks, eWOM and computer-mediated communication, by shifting this activity to the virtual scenario.

CONCLUSIONS AND FUTURE WORKS

The present study shows the effects of advanced technologies introduction on the in-store shopping experience as a social activity. In particular, findings underline the moderating role of the relationship with vendors, electronic word-of-mouth communication (eWOM), trust in technology emerging in the new computer-mediated (technology-enriched) retail environment in the consumers attitude towards the usage of new technologies for asking suggestions and recommendations while shopping.

Our results show how the sense of sociality, usually part of the shopping experience, changes due to the introduction of particular innovative technologies. In fact, these systems modify the relationships with both vendors and other clients, by shifting the traditionally face-to-face interaction to the online channel, as consequences of the extensive usage of self-service technologies. Hence, vendors need to increase their selling ability for maintaining their role in the transactions and avoiding the risk of being totally replaced by a technology or becoming only a sort of e-intermediary. To achieve this goal, they would enhance their capability to achieve, collect and manage consumers' information useful for the development of novel and customized selling strategies or successful novel services.

Furthermore, our research shows the extent to which consumers still need the physical presence of friends (other consumers) while shopping, but also the possibility to substitute this real presence with a

virtual one provided by social networks. In fact, asking suggestions is part of their shopping experience and it is usually perceived as a social experience, but the social interactions shift in the digital context. As it appears in our findings, although the substitution of physical interactions (with vendors and other consumers) is realisable because of the increasing using of social networks for asking suggestions from anywhere, consumers' preference for physical vendors' suggestions and friends support continues being part of the shopping, but it could be soon replaced by the virtual scenario.

Although this study offers interesting insights, there are some limitations that should be taken into account. The first one is related to a particular part of population considered as sample (individuals between 20 and 30 years old), which may partially reduce the general validity of the research. Future studies may also focus on the effects of different demographics (in addition to the gender and age factors, such as the education or monthly income), as well as on the exploitation of TAM (Davis, 1989) and on the investigation of consumers' response towards the actual use of the technology.

THE GREEN AND SMART FURNITURE (GSF) RESEARCH PROJECT: A BEST PRACTICE IN INTEGRATED R&D-BASED INNOVATION

Papadopoulos, Ioannis¹; Karagouni, Glykeria¹; Trigkas, Marios²

¹Technological Educational Institute of Thessaly, Department of Wood & Furniture Design and Technology, Greece

²Aristotle University of Thessaloniki, Department of Forestry & Natural Environment, Lab. of Forest Economics

ABSTRACT

The present paper describes the Green and Smart (GSF) project developed by the Laboratory of Applied Marketing, Management and Economic of the Wood and Furniture Design and Technology Department of TEI of Thessaly Greece. The project was implemented under the lens of open innovation and industry-university approach and following the theoretical principles of new product development management. The emerging innovation and the way of its achievement is suggested to constitute best practice at sectoral level and a basis for theoretical research on the specificities of academia-based innovation and its application by low-tech industries to relevant global markets. A novelty of the project was the fact that whether projects of its kind result in a physical innovative object or touch upon purely theoretical areas such as hypotheses based on field research or existing case studies, GSF combined the two approaches by producing physical innovation and at the same time by studying the phenomenon by its own evolving case study.

Keywords: *Green and Smart Furniture, open innovation, industry-university relationships, new product development management, low-tech industries, furniture industry, entrance furniture.*

1. INTRODUCTION

Furniture manufacturing constitutes a significant sector in the E.U. with a strong presence globally, mainly because of the high quality standards in technical and aesthetical level (UEA, 2005). European Union is still one of the biggest manufacturers, traders and consumers of wooden products in the world (European Commission, 2013). During the period 2000-2007, furniture industry has known significant growth; however, the crisis of 2008 and a series of global rearrangements of the sectoral players with Asian producers to take the lead and big players to change the rules of the game. Furthermore, the continuing severe crisis in Greece intensifies the rather negative and risky efforts of Greek furniture manufacturers to survive.

A number of studies (Petrakis et al., 2015; Trigkas et al., 2014, Kumar et al., 2013; Gibson and Naquin, 2013; Castellacci, 2008; Cooke and Wills, 1999;) indicate innovation and differentiation together with the development of extroversion as the only ways for these firms to stay active in the national and global markets. Companies need to develop specific capabilities and sense emerging opportunities which can be market or technology driven.

An emerging field for innovation regards the growing concern related to the environmental consequences either in regard of production and transportation or raw materials and the use and disposal of produced goods during their lifecycle (Fankhauser et al., 2013; Costantini and Mazzanti, 2012; Papadopoulos et al., 2010; Lin et al., 2011; Van Kleef et al., 2007; Humphrey and Schmitz, 2001). Furthermore, technological advances and ICT applications offer the potential of novel concepts regarding comfort, usability and even production (Ollo-López and Muneta, 2012; Wu and Zhong, 2009). On the other hand, markets and consumers provide opportunities for differentiation and the creation of niche and sub-niche markets (Trigkas et al., 2014). Therefore, furniture firms cannot afford to stay introvert and traditional; on the contrary the survivors will be the ones that will de-learn old habits and invest in knowledge, market and technology sensing as well as in co-operation with knowledge providers.

The GSF research project was based on this very gap and opportunity; i.e. the intersection of ecology, ICT and the tacit and existing needs of a specific consumers' group, i.e. aging population. Research focused on the development and market introduction of technologically supported care service solutions to foster the elderly's self-determined living in their homes.

The present paper describes the GSF project under the lens of open innovation and industry-university approach and following the theoretical principles of new product development management. The emerging innovation and the way of its achievement may constitute best practice at sectoral level and a basis for theoretical research on the specificities of academia-based innovation and its application by low-tech industries to relevant global markets.

2. BACKGROUND OF THE RESEARCH PROJECT

2.1. The furniture sector in Greece

The furniture sector is mature, highly fragmented and labor intensive with many firms operating in a 'craft' production mode to cover domestic demand, while exports are rather insignificant. Changes were rather slow till the end of the previous century; combined with the prosperity of the sector till 2007, an illusion of stability did not allow Greek Furniture firms to prepare and confront the oncoming multilevel crisis. Well protected and stable, the industry faced during 90s the increase of imports. Yet, furniture production recorded an average annual growth of 6.8% in nominal terms, thanks to the

positive economic activity in Greece in recent years. However, after 2008 the sector was dramatically hit by the crisis, while it had already become vulnerable due to decreasing production in absolute numbers, as well as the increasing number of mainly trendy products from Italy¹ and Spain, cheaper products from Turkey, China and India and different approaches such as of IKEA.

Moderately paced changes at technologies, products, market development and competition combined to pressures for environmental sustainability by EU regulations, government and groups had spurred both product and process innovation with no great success however. Greek firms were mainly followers with production methods restructuring based on advanced CIM systems. Unfortunately, even in this area, the Greek furniture sector has no reputation being overwhelmed by Italian, Spanish or Scandinavian design. Easier transport, competitors with lower prices (economies of scale), faster deliveries (advanced logistics) and established design threat to share the Greek market pie while export numbers show major weaknesses of Greek producers. Nowadays, environment is far from stable, especially when considering the Greek economic recession and its effects on furniture as durable goods and the collapse of building activity.

2.2. Innovation and Furniture Product Development for Aging Users

Aging populations are a major challenge for industries and firms, since they offer opportunities in regard of technical and social innovation and the emergence of niche markets. Innovative approach of the specific target group can turn apparent crises into opportunities (Kohlbacher & Herstatt, 2008) exploiting expectations and demands (Clark, Ogawa, Kondo, & Matsukura, 2010). Furniture industry may adopt other industrial knowledge such as gero(n)technologies and information communication and technologies (ICT) and blend it with design in order to create novel and differentiated product categories (Filippetti, 2011; Gregor, 2009; Goodacre, McCreddie, Flanagan, & Lansley, 2007; Candi, 2006). The E.U. is also giving special attention in the development of smart furniture for the third age through the funding of the WIDER project (2014), in order to give the opportunity to furniture industries across Europe to innovate and differentiate from the competition and to produce this kind of products.

The furniture industry can either adapt some of its existing products or create new ones to meet elderly people's changed sensory, perceptual, cognitive, and psychomotoric capabilities (Rogers and Fisk, 2010; Schäfer, Huxhold, & Lindenberger, 2006). Therefore, user-centered approaches can be transferred to furniture-centered ones enhancing the relationship between producers and users in the

¹ Since 2001 Italy is however losing share in favour of imports originating in China. Chinese made furniture destined for the Greek market registered in 2007 an increase of 78%, almost doubling its value, and an average annual growth rate of 55% between 2002 and 2007.

specific markets. Two major areas of innovation in furniture design in general have been recorded to be:

Green furniture: Eco-furniture or “green” furniture is broadly defined as a product of furniture designed to minimize the environmental impact during its whole life-cycle (Albino *et al.*, 2009; Baumann *et al.*, 2002) and thus; as furniture with characteristics of environmental compatibility, taking into consideration all the stages in furniture life-cycle (Alhola 2008; Progetto Life, 2005). According to recent research (Sakai *et al.* 2004, Mantanis and Ntalos, 2007, Mantanis, 2007) normal home furniture and structural material of timber usually emit toxic and damaging gases and influence more or less human health. *Formaldehyde* emission, emissions of organic solvents, biocide, volatile organic compounds (VOC's), adhesive substances etc can cause serious diseases, such as genetic abnormalities and cancer. Several measures have tried to eliminate the negative features of wood-based products. Moreover, an emerging stream of research focuses on environmental friendliness of wood-based products and their production. For example, The ‘Life Environmental Eco-friendly furniture project’, launched in Italy during 2001, aspired to develop furniture prototypes regarding environmental protection at all the stages of a furniture life cycle (Progetto Life, 2005). However, to the best of our knowledge, eco-design has not been directly related to the specific group of aging population.

Smart furniture: Smart or intelligent furniture is a quite novel approach to furniture innovation moving from transformable pieces of furniture to interactive furniture (Tokuda *et al.*, 2003; Zongdeng and Wenjin, 2010). Utilizing ICT solutions, a smart furniture product has the capability to alter a conventional space into an intelligent spot that includes computing systems (Ito *et al.*, 2003). For example, Ubiquitous Computing (UmpiComp) environments (Wuliji, 2009) have been developed to apply computing systems to our everyday living environment, making them at the same time “invisible” to the user (Weiser, 1993). There is a growing number of ICT-based smart furniture such as the *Dietary-Aware Dining Table*, developed by a research team of the National University of Taiwan (Chang *et al.*, 2006) or the *Drift Table* and the *Key Table* developed during the project for *residential technologies of Equator IRC* (Gaver *et al.*, 2004; Boucher *et al.*, 2006). Contrary to eco-furniture, smart furniture for elderly is a fast emerging field in both academic and practical level (Guennoun, and El-Khatib, 2009).

2.3. Project concept and objectives

The aim of the research project under the name “GSF - Green and Smart Furniture ” was the development of intelligent and purely ecological furniture that would provide a better experience of house life without overloading the users with technology and the pilot production of at least one of the product ideas and concepts.

Following the general principles of NPD management, the focus was on the improvement of in-house activities and operation regarding the furniture. The solution would turn to the utilization of modern technologies not only for the manufacturing and material and final product traceability, but also at the furniture's use. At the same time this very furniture should provide the sustenance or even the vivification of the natural way of life and manageability by all possible users (elderly, children, people with special needs etc.)

Besides the creation of a physical innovative, R&D based product, the project aspired to cover various areas at multiple levels, such as:

- The creation of a path to innovative niche markets and the cultivation of innovative and collaborative culture to the extremely traditional and introvert furniture industry in order to support the survival and recovery of the sector.
- The promotion of ecological innovation (eco-innovation) and its incorporation in the productive network of Greece as a main factor of growth and competitiveness.
- The encouragement of the networking to high tech industries and the shift to intelligent furniture (technological innovation)
- The further support of environmental protection and the rational management of forestal wealth (wooden furniture)

A core aim of the project was the provision of best practices and new innovative strategic directions for the traditional sector of furniture, considering the fact that the sector is in a severe decline, due to the economic crisis and it faces serious problems of survival.

The project was, to our best of knowledge, among the first worldwide to attempt the manufacture of a complete innovative furniture product which would be both smart and ecological. To our knowledge, efforts have focused in the exploitation of leading edge technologies in practical applications (home, office, class) parts of which are also the various pieces of furniture. A consequence of these research efforts is the treatment of furniture as dependent parts of "intelligent" multiuse spaces (smart home, Philips' Ambient Intelligence, Microsoft's eHome, HP's CoolTown Project, iHOME in Australia, MIT's House_n, SSLab smart classroom project etc) which answer the challenge of information technology systems development. This concept however overlooks the basic furniture design principles (ergonomics, aesthetics etc), disregards timber as an unfriendly material to adapt the multiple digital elements and is indifferent to the ecologic character of the products it creates.

In order to create a holistic best practice for the innovative process and in order to produce effective and applicable results, the WFDT team established collaborations with the Economic

University of Athens, the University of Cyprus, the Department of Business Administration and the Department of Electrical Engineering (both of TEI of Thessaly), an ICT company and a furniture manufacturer.

The research team was further committed to follow the structured methodology of new product development as provided by Ulrich and Eppinger (2000) and transfer the knowledge of the integrated R&D-based, open-innovation process to stakeholders of the industry as a deliverable of the project. The project included six (6) Work packages and namely:

(i) the delineation of the GSF Product Development process, (ii) the determination of GSF market in Greece and its tendencies (Targeting and trend analysis), (iii) the design of eco-logical - GS furniture, (iv) the production Technology of eco-logical GS furniture, (v) economic analyses and (vi) promotion and communication of the innovative product .

It should be mentioned that the Economic University of Athens was involved mainly in the phase of the economic analyses, while the University of Cyprus and the Department of Business Administration collaborated with the core research team mainly in the first, second and last step.

(i) The delineation of the GSF Product Development process: The project was based on two pillars: the increasing number of environmentally sensitive consumers worldwide who constitute a very important target group and the knowledge pool of the Department of Wood and Furniture Design and Technology regarding ecology, such as the use of timber from sustainable managing forests, use of natural glues without chemical additives, use of natural dyes, use of timber from remains of treatment and cultivation of forests and recent empirical research in the Department's laboratories. However, the team contacted a thorough literature review regarding theoretical and empirical research on issues regarding ecological furniture, smart furniture, relevant market segmentation, legislation and regulation as well as all relevant research efforts in Universities and Research centers. Furthermore, literature review would direct the team towards the groups most likely to be chosen as target market.

Following Ulrich and Eppinger (2000), the research team prepared:

- The Design Brief which included the vision and the purposes of the project, its milestones, the stakeholders, the new product development planning (time planning and processes), the establishment of the target group, criteria, limitations and hypotheses, product lists and timetables
- A delineation of the market research of consumers for their intention to buy eco-smart furniture, and furniture manufacturers regarding their intention to manufacture and promote innovative furniture, since such a strategy is not to be taken for granted.

(ii) *The determination of GSF-market in Greece and its tendencies:* The literature review and initial stakeholders; meetings indicated vulnerable groups such as children and elderly people. A second round confirmed the choice of aging populations. Consumer-centered research was then contacted to produce knowledge on the development of products and services that deliver real benefits to elderly people, form their preference profiles, thereby to build an understanding of their specific requirements, needs and desires, which would allow the creation of a framework to work within (Papadopoulos et al., 2014). Traditional research has perceived aging consumers as passive recipients (von Hippel, 1988) that belong to the pre-ICT generation. However, aging consumers can be healthy and active seniors relatively secure financially, ICT-lovers and independent. This aged user subgroup, known as “silver users” or the “silver market” (Herstatt, et al., 2011) is further eco-sensible and aware of design.

The market research provided a framework and the empirical evidence to the team member to recommend types of innovation, to indicate strengths and weaknesses and (later) to propose ways to diffuse the innovation in national and global aging markets. This resulted in best practice recommendations for furniture manufacturers including potential benefits from the challenges of aged markets.

(iii) *Design of eco-logical - GS Furniture:* Addressing the existing and tacit needs and requirements that were derived by the market research and the meetings with the Department’s designers required complementary competencies. For this reason, in this phase of the project, the Department’s research team combined their expertise and knowledge with the ICT and automation company, the department of electrical engineering and the furniture manufacturer. Thus, the GSF project combined competencies from wood technology, ICT technology, furniture technology, design, electronics, NPD and innovation management, marketing, and all necessary research methodologies to design and later produce the innovative eco-smart piece of furniture.

Designers gave a number of ideas in sketches. Braining-storming and several controls for the satisfaction of the core criteria lead to the final choice of three different pieces of furniture with distinctive characteristics that seemed to satisfy the majority of the initial targets of the team. The three pieces were then presented in 2-D and 3-D designs as analytical as they could be. Another round of meetings with all stakeholders led to the final selection of a main entrance furniture which would also serve as an information provider.

The contribution of the stakeholders was once again of critical importance. The experts of the ICT Company co-operated with the designers to solve difficulties of turning common furniture pieces in sources of interaction. Indicatively, the mirror was turned to a face recognizer and a provider of information; i.e. regarding the weather it would remind the person who used it to take the umbrella

for the rain or for the sun. The first version of the innovative furniture was further designed to provide store rooms and relevant information on position of small objects such as keys, glasses, wallet and purse and pills and to remind the user to take them if needed. The product provided further the potential to add or remove parts, it could adapt to specific individual needs and it could also co-operate with other smart devices in a smart environment; i.e. inform on security issues. Furthermore, the research team worked together with the furniture company members on novel eco-based materials such as natural wood, recycled or recyclable materials that would better suit the object and could be manufactured in energy and water-saving ways. At the same time the ICT company members had to indicate eco-based material and the best ways to incorporate the electronic staff in the furniture; i.e. to make it invisible.

(iv) The production Technology of eco-smart GS furniture: Once again expertise and knowledge of all three parts was needed to produce the pilot furniture product. There were certain difficulties in the challenge of implementing intelligence solutions in a sustainable furniture system; this actually included material, design and production. The team managed to overcome difficulties with a significant number of try-and-error efforts at all three laboratories. It should be mentioned that it was a highly iterative process since many of the initial suggestions had to be reconsidered due to limitations mainly imposed by the combination of intelligence and ecology issues. The assembly of the parts was realized in the firm's plant to simulate real conditions of manufacturing. Test of functionality however took place in different places. Quality controls took place in the WFDT Department's laboratories with the assistance of the ICT Company as well.

The relevant know-how was then written down as a basis for the preparation of a manufacturing handbook for mass production or mass customization production. However, this phase is not yet possible, since there was only one prototype manufactured, while a pilot production is still pending. Yet, the general framework of the production technology and assembly has been delineated, while there is a range of natural wood species and eco-based supplementary material selected to be included in the relevant handbook of eco-smart furniture manufacturing suggestions.

The final technical and manufacturing drawing plans were submitted to Industry Property Organization (IPO) to be granted a certificate of registration as industrial designs and be patented.

(v) Economic analyses: Innovative activities face at least two types of uncertainty: technological and market. Technological uncertainty refers to the uncertainty of transforming a research idea into a technically viable industrial project. In the GSF case this obstacle was overcome by the fruitful application of open innovation including major partners to areas relevant to the research problem imposed. Market uncertainty, on the other hand, refers to the existence of potential buyers of the innovation; besides the market research this is rarely guaranteed at the moment of an R&D project

choice (Hall et al., 2010). This uncertainty is often the most difficult to overcome, and impact in major ways the commercial performance of the innovation.

Economic analyses were a major working package of the Laboratory of Applied Marketing, Business and Economics of WFDT Department supported by the other stakeholders too, in regard of specificities such as costs of electronic and wages. The aim was the estimation of the manufacturing and production costs per unit, potential profits and prices and the economic evaluation of the related investments, based on the inputs and outputs and the expected cash flows of the products life cycle. The objectives were based on the development and application of modern cost accounting methods specially designed for innovative products and through the analysis of the inflow efficiency for the manufacturing of the specific product. The team would also provide a business plan for the specific innovative activity.

(vi) Promotion and communication of the innovative product: Nowadays, with an impressive number of new products conceived every year, it is quite difficult to break into the market and turn a novelty into a consumer staple convincing people that they are in need of something that did not exist before. Moreover, promotion methods have to focus on your target group but have an appeal in other consumer groups as well. It then becomes a matter of making aging consumers think out of the box; this implies find adequate promotions methods, the perfect words or aspiring traditional forms.

The research team worked on the issue, keeping in mind that, in such cases, “you have to build consumer understanding from nothing” (Gannon, 2011).

The prepared marketing plan a) stressed the benefits of the innovative product; b) delineated the main target groups and other potential users; c) discussed the messages to send to the market and ways to communicate them (e.g. media) d) estimated the percentage of target market groups that would adopt the innovative product in Greece in the context of the severe crisis. The final report included suggestions for branding since it plays a significant role in the success of new products.

2.4. Project evaluation

The touchable result was the manufacture of the first European ecological and at the same time intelligent furniture product supported by its handbook of production guidelines.

The overall results justified the initial vision of the research team as well as the selection of the collaborative partners. More specifically, the project resulted in: a) the acquisition of specific know-how on the ecological and the intelligent furniture, b) the dissemination of know-how in the furniture enterprises at the region of Thessaly, c) the creation of a database of all relative legislation on ecological furniture, d) the creation of a model Product Mission Statement available to the furniture manufacturers in Greece who seek differentiation e) information on aging

populations which constitute a significant target group for furniture manufacturers at global level, f) records on determining factors (in favour of and/or constraints) for the ecological furniture market growth g) an integrated design study of ecological-smart furniture, h) patented industrial design of a specific model furniture, i) codified experience and learning material for excelling designing skills and capabilities, R&D collaboration, networking and NPD in the furniture education, training and industry in general, g) a marketing and branding plan which can be used as prototype guides for novel furniture products which aspire to create a niche market or even to share the existing markets.

However, the GSF project appeared to have established conditions for evolvement of innovative culture in the furniture manufacturers of the Region. It was the first to introduce networking and collaborative NPD among stakeholders of different industries in the sector at regional level and, to our best of knowledge, at national level too. It also encouraged the development of relations between low-tech firms, the Academic Community and high-tech counterparts as well.

3. DISCUSSION

The competitive international environment and the need for highly differentiated and innovative products in the furniture industry impose the focus of furniture enterprises in the development of collaborative research and the familiarization with open innovation. This is, however, not that easy as theorists still believe. The majority of furniture manufacturers in Greece - but in Europe as well - are small and micro-companies with relatively low educational level, familiar in working with consumers that live in their neighbourhood area and reproducing common pieces of furniture. Furthermore, a theoretical approach has normally very low, if any, appeal on them. The practical application of open-innovation and R&D-based theory may challenge at least the open-minded entrepreneurs to reconsider their strategy and engage new approaches to NPD, product life-cycle and potential markets. This appears to be an imperative for the Greek furniture industry's enterprises particularly after the recent economic crisis which plagues the Greek entrepreneurial world in general and the furniture manufacturers more specifically.

The GSF project may constitute an exemplary integrated NPD process since it offers both codified and tacit knowledge and experience together with the launching of the innovative furniture product. The project resulted in a series of innovations regarding strategy, knowledge-based innovation processes, networking, technology and know-how transfer and ecology and ICT issues. Actually, it can be claimed that the specific research project has built a framework for the planning, design, development and production of a Green and Smart furniture providing to all interested a well-organized process which includes the creation of new needs and desires that result in niche markets,

the role of legislative and qualitative requirements and ways to combine them in order to produce novelty. It furthermore, facilitated first contacts of the mature furniture industry in the Region of Thessaly with high-tech such as ICT and automation providers not for the sake of production processes and the machinery counterpart but for the creation of high-tech furniture end-products. This is an innovation approach for the sector at national level.

The use of electronic and other high technology applications, the certified ecological materials, the creation and the patenting of innovative designs, the interaction and integration of research and production, the briefing of sector stakeholders and the creation of suitable marketing plans created an innovative environment for the enterprises of the regional industry. This environment now exists and can offer the chances to firms to face the above mentioned challenges through a cognitive process of innovative product design and development at both Greek and European level, having an integrated approach from the entrepreneurial –manufacturing view as well as the viewpoint of consumers. This can enhance relevant investments such as mechanical equipment, job creation, market revitalization and personnel training, strengthening the local economy, supporting exports and the support of income of sectoral workers.

It should be an omission not to mention benefits for consumers; advanced furniture products based on ecological approaches advance the wellbeing, secure health issues and support the tendency of aging populations to live independently. The project further indicated that actually the idea and product development for aging users can be a very complex task, since little is known about the specific characteristics this target group. There were certain areas that needed to be approached from multiple angles; this was achieved by the collaboration of the diverse teams that bared knowledge from different perspectives and allowed the answers to common research questions.

An indirect but very important impact of the GSF project is also the emergence of the issue for the protection of forestal wealth through the use of raw material that will emanate from certified sustainable managing forests, contributing to the environmental protection. Therefore, it appears that five at least groups can potentially benefit from the project deliverables:

- (i) Furniture Enterprises that focus on innovation and emphasize on green entrepreneurship.
- (ii) Researchers on relevant issues such as innovation, technology of production, economy, marketing, business administration and relevant areas
- (iii) Institutions that are committed to innovative approaches and strategies diffusion and Chambers of Commerce and Craft-based Industry

- (iv) All consumers with a special focus on aging users, since they will be the final receivers of the innovation benefits
- (v) Ecologists can also benefit in terms of the increase of innovative product approaches in favor of the environment

CONCLUSIONS

This article provides some revealing insights into what a Greek research team in a traditional sector, operating in markets where innovation is a focal point of competition, has learned about partnering in the new products development process. To succeed in a rapidly changing environment, the project promoted collaborative research and the familiarization with open innovation. Furthermore, the implementation of the GSF project activities, show that the transition of knowledge is the factor throughout the product's development process that occurred most often. Gaining more knowledge about what actors from different disciplines need to know from each other's disciplines in order to collaborate effectively, could be another line of future research in the field.

The project has also revealed that NPD could be implemented under the framework of a project management procedure with a well-defined set of desired results, one clear dominant objective with cost, time, and performance elements and a sequence of interdependent tasks till the final utilization of a product. This model could be adopted as a *best practice*, by low tech industries, and the furniture sector in particular, regarding open innovations and launching of new products.

This best practice in the Greek furniture sector is based to the creation of new niche markets, essential for the survival and growth of the sector, in the present crisis of world market contributing in the progress of Greek furniture design, which now makes its infantile steps. The realization of the proposed project furthermore, strengthens the Green Entrepreneurship in the sector of timber and furniture with the use of high technology, evincing and supporting the complementarity of the modern enterprising environment. This may lead to mass production and enlargement of the basic (and not only) production frame of the sector's enterprises, strengthening their competitiveness through the production of products of high added value and friendly to the environment, supporting entrepreneurial competitiveness and sustainable manufacturing in the sector. The project suits the challenge of manufacturing products which comply with quality specifications in terms of consumers' health and safety and the certification of ecological products of high added value. Especially after the implementation of Joint Ministerial Decision no Z3 5430/22-4-09 in Greece which concerns the limits of emitted formaldehyde of the wood based products, the proposed project enables the sector's enterprises to conform to the legislation and through concrete results of the applied research, offer alternative products for the benefit of consumers.

A deeper knowledge about how the collaborative mechanisms and knowledge transition in NPD work regarding low tech sectors, could result by investigating a number of different case studies in the field. By having extensive knowledge about these phenomena, it is possible to create a series of best practices for knowledge integration within the NPD process, proposing a certain entrepreneurial and innovation strategy for the related firms.

PREVALENCE OF 'FACE CONCEPT' AMONG SOUTH ASIAN CONSUMERS- A COMPARATIVE STUDY OF UNFOLDING THE FACETS IN DECISION MAKING PROCESS OF BUYING BEAUTY PRODUCTS

Pervin, Shahina; Wilman, Mike; Ranchhod Ashok

FBSE, Southampton Solent University

ABSTRACT

The focus of this paper is to explore the level of importance of the term 'face concept', consumers transfer in their purchase decision of beauty products. The authors intend to study differences in the consumption behaviour of highly collectivists Bangladeshi consumers' compare to the highly individualistic UK consumers. Concept of face is acknowledged in every culture. However, the term 'face' is characterised differently according to one's cultural setting; for example, 'face' represents the interpersonal relationship between the individual and groups in Asian society. On the other hand, from a European perspective face may represent stronger personal self and assertion. In this paper we tend to identify the contributing factors to 'face concept' of Bangladeshi female consumers in their pre, actual and post-purchase behaviour of cosmetics products compared to the British female consumers.

A structured questionnaire survey was conducted among female Bengali consumers in the capital city of Dhaka in Bangladesh and female British consumers in Southwest London in the United Kingdom. We have compared the degree of face concept and its impact on decision making process of female consumers in the UK and the Bangladesh by using factor analysis. Five factors were extracted from factor analysis: 'thoughts in cosmetics', 'brand link to social recognition and prestige', 'skin colour link to authority in society', 'group conformity' and 'personal-self'. Among all the five factors the only factor labelled differently for British consumers is the 'brand link to personal satisfaction'. It was noticed in the labelling process of the five factors that the extracted components were not exactly the same for both Bangladesh and the United Kingdom.

Keywords: National culture, Consumer behaviour, Face concept, collectivistic/ Individualistic culture, group conformity, decision-making process, cosmetics purchase

INTRODUCTION

In cross-cultural research, concept of face has been studied largely in East Asian context. However there has been very little study relating to 'face' and consumption behaviour in South Asian context. Although the concept of face is acknowledged in every culture, the term 'face' is characterised differently according to one's cultural setting; for example, in Asian Society 'face' represents the interpersonal relationship between the individual and groups. In China 'lien' (moral integrity) and 'mien-tsu' (prestige and reputation based on personal effort) are the depictions of face (Yau, 1994). There have been several studies addressing face and face-related issues (Brown and Levingstone, 1987; Holtgraves, 1997; Kim 1994; Leung and Chan et al., 2003; Schutte and Ciarlante, 1998) on negotiation, decision-making and conflict management; however how face influences consumption remains unclear, and its conceptualisation requires further clarification and investigation (Li and Su, 2007). The concept of face is also important in western society, in the conduct of inter-personal relationships and in cultural development, but perhaps is less obvious and more subtle, appearing to be not important when actually it is (Hofstede, 2001).

This paper seeks to identify how 'concept of face' influences the attitudes of consumers towards the purchase of cosmetics in a cross-country environment. This paper intends to explore the following two objectives:

- To investigate the nature and influence of 'concept of face' among Bangladeshi consumers in their purchase decision of buying beauty products.
- To identify the key factors underpinning the precedence of 'concept of face' in consumption behavior between East (Bangladesh) and the West (UK, amongst the white British women).

LITERATURE REVIEW

The aim of this literature review is to investigate the cultural elements and to identify the key factors impacting consumers' preference to choose and purchase beauty products at different stages of their buying decision.

Bangladesh considers to be one of the 20 Markets of the future that will offer the most opportunities for consumer goods companies globally. The country is one of the fastest growing and most promising economies in Asia-Pacific (Euromonitor International, 2012). Euromonitor 2012 also reported that, growing disposable income and an expanding urban middle class also bolstered sales of non-essential items. As a result, categories such as beauty and personal care products (CAGR 15%

over 2009-2013), home care (CAGR 12%) and tissue and hygiene (CAGR 20%) also performed strongly. This research intends to outline the underlying factors in decision making process of buying cosmetics from a cross-cultural point of view.

DIMENSIONS OF CULTURE

Geert Hofstede's cultural dimensions are widely used in international cross-cultural studies, the dimensions model is based on quantitative research and provides scores for 75 countries. Hofstede's (1984, p. 78) cultural dimensions approach is characterised as a national culture in terms of its average pattern of beliefs and values. Consequently, countries are divided on the basis of their scores on the five dimensions into cultural areas, and in some cases it is possible to find historical reasons for the cultural differentiation between the areas. Hofstede's (1980, 1984) Cultural Dimensions Model differentiates cultures according to:

- Power distance (PDI)
- Individualism/ Collectivism (IDV)
- Uncertainty Avoidance (UAI)
- Masculinity/ Femininity, and (MAS)
- Long Term Orientation versus Short Term Orientation (LTO)
- Indulgence versus Restraint (IND)

Although Hofstede initially proposed the four main cultural dimensions, he later has added another two dimensions, Long term vs short term Orientation, initially known as Confusian dynamism, that describes the time horizon and attach greater importance to the future. The second one is called Indulgence versus Restraint (IND), the extent to which member of a society try to control their desires and impulses.

To briefly define, power distance is the societal acceptance of hierarchy; uncertainty is the cultural tolerance of ambiguity; individualism-collectivism is the societal predilection for inter-dependence; and masculinity is the culture's desire for sex-role differentiation (Milner, Fodness and Speece, 1993). Since this phenomenal beginning, Hofstede (1982; 1983a, b, c; 1984a, b, c; 1985; 1987) and others (e.g., Mooij, 2003; England, 1983; Hortum and Muller, 1989; Jensen, White, and Singh, 1990; Kim, Park, and Suzuki, 1990; Lebas and Weigenstein, 1986) have validated and expounded on his initial insights.

Although Hofstede (1980, 1984) proposes five cultural dimensions, the researchers intend to focus on three dimensions, Individualism versus Collectivism (IDV), Power Distance (PDI) and Uncertainty Avoidance (UAI), to identify the relevance of cultural dimensions to consumer purchase behaviour in a cross-national environment. Mooij (2003) stated that dimensions of national culture provide excellent variables that can be employed to analyse cross-cultural consumer behaviour. Mooij further suggested that together with national wealth Hofstede's cultural dimensions can explain more than half of the differences in consumption and consumer behavior.

INDIVIDUALISM/COLLECTIVISM (IDV)

The individualism and collectivism dimension at the culture level relates to how one values the individuals relative to the group (Gregory and Munch, 1996). Hofstede (2001, p.210) states: "The relationship between the individual and the collectivity in human society is not only a matter of ways of living together, it is intimately linked with societal norms (in the sense of value systems of major groups of the population)". In an individualistic culture, the "I" consciousness is central, which articulates private opinion and self-actualisation. Conversely, in a collectivistic society, the "we" term incorporates the identity and harmony with in-group members, and that it is important not to lose 'face' (Mooij, 2003, p.34).

POWER DISTANCE INDEX (PDI)

According to Hofstede (2001), power distance is the extent to which less powerful members of the society accept and expect that power is distributed unequally. Hofstede argues that this inequality is usually formalised in boss-subordinate relationships. The power distance index was derived from the country's mean score or percentage on three survey questions (Hofstede, 2001), which related to the perceptions of subordinates, fear of disagreeing with the superior and of the superior's actual decision-making style, and with the decision-making styles that subordinates preferred in their bosses. From the survey it has been found that the 'power distance norm' as a value system is held by the majority of a country's middle class group. Hofstede (2001) argues that the correlation of the PDI with geographic, economic and demographic country indicators and consideration of historical factors leads to a suggested casual chain for the origins of national differences.

UNCERTAINTY AVOIDANCE INDEX (UAI)

Hofstede identifies the degree of uncertainty avoidance in different social contexts. As uncertainty is a basic fact of human life we try to cope with it through the rules of technology, law and religion

(Hofstede, 2001). Uncertainty avoidance is “the extent to which members of a culture feel threatened by uncertain and or unknown situations” (p. 161). Hofstede (2001) suggests that uncertainty avoidance should not be confused with risk avoidance (p. 161). In strong uncertainty avoidance cultures people believe that rules and formalities shape living patterns. On the other hand weak uncertainty avoidance cultures feel that there should be as few rules as possible (Hofstede, 2001).

EVALUATION OF HOFSTEDÉ’S CULTURAL DIMENSIONS

Although Hofstede’s cultural dimensions have been criticised on methodological issues and conceptual matters, his work has been applied extensively in the field of business culture. Some Social scientists (e.g., Sampson, 1997; Smith 1978; Waterman, 1981) have disagreed on if individualism or collectivism is a desirable characteristics of humans, however they have talked past one another as they referred to very different things with terms such as ‘Individualism’ and collectivism (Hui and Triandis, 1986). Research efforts based on comparisons between cultural groups at the country level should consider the limitations associated with extending culture-level correlations to individual-level behaviour. Hofstede’s culture-level measurements are based on the sums of individual characteristics and may have limitations when extended to individual behaviour (e.g., beliefs, evaluations and intentions). Many refer to this phenomenon as an ecological fallacy (Gregory and Munch 1996). Beyond these shortcomings, however, Hofstede’s research on work-related values in a cross-cultural context does seem applicable to consumptive behaviour in a cross-cultural context (Milner, Fodness and Speece, 1993). Schwartz (1996) suggests that in order to better understand how differences between individuals’ beliefs, evaluations and intentions are related to individual differences in value priorities, that researchers examine the individual-level value types that underlie the individualism-collectivism construct.

CONSUMER BEHAVIOUR AND CULTURE

According to Zaltman (1983, p.5), “Consumer behaviours are acts, processes, and social relationships exhibited by individuals, groups, and organisations in the obtainment, use and consequent experience of products, services and other resources”. “The behaviour that consumers display in searching for, purchasing, using evaluating and disposing of products and services that they expect will satisfy their needs” (Schiffman and Kanuk, 2004, p. 8). Usunier and Lee (2005) explain consumer behaviour theory from a variety of perspectives concerning cultural consumer behaviour theory such as a global perspective, an imported perspective, an ethnic consumption perspective and a cultural meaning perspective.

Bodley (1994) states that culture involves at least three components: what people think, what they do, and the material products they produce. Hofstede (1980, p.19) defines culture as the interactive aggregate of common characteristics that influence a group's response to its environment. Hofstede (2005) also describes culture as the collective mental programming that distinguishes the member of one group or category of people from others. Usunier (2000) explains the impacts of cultural differences on selected aspects of perception, motivation, learning and memory, age, self-concept and group influences, social class, sex roles, attitude changes, decision making, and purchase and post purchase behaviour.

Despite the multiplicity of cultures in Asia, there are many characteristics that are more or less common across many Asian cultures (Schutte and Ciarlante, 1998).

FUNDAMENTAL DIVERSITY BETWEEN BENGALIS AND THE BRITISH

Schutte and Ciarlante (1998) argue that in order to describe Asian consumer behaviour accurately we must follow two premises: first, consumer behaviour is strongly influenced by culture and second, Asian culture is distinctly different from Western culture. Therefore, it is essential to establish the basic societal and cultural background in which behaviour takes place in order to bring to light the differences in consumer behaviour between the UK and Bangladesh. From the study of cultural dimensions it is clear that Bangladesh belongs to the culture-type that is described as collectivistic whereas the UK belongs to the culture-type described as individualistic. Bangladesh also falls in the category of high PDI and high UAI society; on the other hand UK is characterized as low PDI and low UAI society.

Hofstede's dimensions' raw scores (Figure 1) confirm the differences in culture between Bangladesh and the United Kingdom.

Figure-1: Differences in culture between Bangladesh and the UK (Hofstede, 2014)

THE CONCEPT OF FACE IN BENGALI CULTURE

Face represents as an important role in the way a culture pursue its values which can be varied according to different country perspective. In a collectivistic society face is regarded as the medium of expression of respect, moral integrity, personal image, wealth, social status, prestige, level of education and the conformity to society's traditional values. In Asian culture the terms "gain face" or "face-saving" indicate that someone has good social reputation within the community and is reliable, dependable and safe to build up a relationship with. On the other hand losing face is referred to as an act of aggression (Yau, 1994). Chinese individuals who are collectivistic in nature are mindful about the need to maintain a high degree of moral control, at least publicly, and carefully assess the possible effects of their actions on others before embarking upon a course of action (Schutte and Ciarlante, 1998). It has been argued that people in collectivistic cultures are conscious about not losing face; rather they endeavour to gain face for the family through the accumulation of wealth, prestige, status power and so on (Schutte and Ciarlante, 1998).

The concept of face is relatively similar among the Asian cultures in terms of family relationship, status priority, and conformity etc. As a part of Asia, Bangladesh shares the concept of face in the way as do China, India, Thailand, and Indonesia among others, however, to what extent, may vary. In Bengali society 'Mukh' (face) represents a social mirror in which a person can be observed by his or her performance, relationships and the acceptance within society, as well as level of conformity, and is able to earn admiration as a result. For a collectivistic society, to gain face 'mukh rakha', or to lose face 'mukh harano' form the essence of life for Bengalis because of the control the community has over the individuals. To gain face in Bengali culture can be characterised by being honest and educated, and of high rank or social class which consequently provides power and authority in society. Loss of face symbolises embarrassment, and shame in Bengali society. As a collectivistic society, it is imperative

for Bengalis to project the right image as being classy, up-market and prestigious by securing the term 'face-saving' where Bengalis rank high in a power distance society. According to Hofstede (1984), in high power distance societies, differences in power are expected to translate into visible differences in status.

In contrast, the existing concept of face in Bengali culture is likely to be absent in British culture because of its individualistic nature. Just as the collectivistic nature of the culture makes Bengalis attached to the family and conform to group decisions which is ignored in British culture, preservation of face and loss of face are related to the perception of the individual self in Britain. As Chiappini and Harris (1997) state: "In an individualistic culture individuals are free to choose the image they project to others". Thus the gain of face is not influenced by the desire of society or conformity; rather it is very much independent and controlled by individual aspirations. According to Hofstede (1984), in high power distance societies, differences in power are expected to translate into visible differences in status.

From the literature review it was established that there are several key factors linked to the 'concept of face' in Asian culture, such as the status priority and the acquisition of branded goods, kinship and family relationship, attitudes to skin colour, and concept of self. Most importantly, the extent of the authority of these factors on the decision making process is dependent on how a society practices its cultural values. For example, in a collectivistic culture with a high power distance society the need for achievement and affiliation is the basis of power. As a collectivistic culture the high level of interdependence among Bengali individuals corresponds with lesser personal attachment to material objects and a greater attachment to human beings. Indeed the conspicuous consumption may seem to clash with traditional characteristics of Asian culture such as pragmatism, collectivism and modesty in self-presentation; however, the explanation lies in the fact that the luxury products symbolise status and face-giving in the Asian culture (Schutte and Ciarlante, 1998).

RESEARCH METHODOLOGY:

As mentioned earlier, this paper seeks to identify how 'concept of face' influences the attitudes of consumers towards the purchase of cosmetics in a cross-country environment. A questionnaire survey method was selected for data collection. A two country comparison was performed in order to acquire a comprehensive understanding of the perceptions of concept of face.

Over 300 questionnaires were posted in Bangladesh using personal contacts and viral messaging. Approximately 1,500 were posted in the UK by using Royal Mail service. From Bangladesh, 150 fully

completed questionnaires were returned and 142 from the UK, providing a total viable sample of 292 questionnaires.

Sampling:

In order to determine a valid sampling frame or a mailing list, The Royal Mail UK's Address Management Software was used to select the target population in the Hampshire area. In Bangladesh a valid Postal Address Book was used to select the target audience. As the mailing list contains millions of addresses, systematic sampling was considered applicable in order to avoid extra costs and time in comparison to simple random sampling.

RESEARCH HYPOTHESIS

A research Hypothesis was formulated to test that, *'female Bengali consumers are more influenced by the concept of face-saving than their female counterparts in the UK.* Several variables and scales were constructed to test the hypothesis.

MEASUREMENT AND SCALING PROCEDURE

According to Malhotra (1999) scaling involves creating a continuum on which measured objects are located. In a collectivistic society face is regarded as the medium of expression of respect, moral integrity, personal image, wealth, social status, prestige, level of education and the conformity to society's traditional values. The 18 statements of face were asked in the questionnaire survey. In order to meet research objective, which aim to explore the perceptions of face concept and its influences on the decision making process of buying cosmetics, the variables and scales were constructed using with 5-scale Likert measurement (1= strongly agree, 2=agree, 3= neither agree nor disagree, 4= disagree and 5 =strongly disagree). The attitudes towards face concept were simplified and reduced into composite variables by the factor analysis technique.

FACTOR ANALYSIS

There are two primary functions of factor analysis – one is to identify underlying constructs in the data and the second is simply to reduce the number of variables. Factor analysis procedures attempt to retain as much of the information as possible and make the remaining variables meaningful and easy to work with (Field, 2009). According to Hamilton (1992), factor analysis provides a basis for combining variables, (p.263). Bryman and Cramer (2005) describe that factor analysis is primarily concerned with “describing the variation or variance which is shared by the scores of people on three

or more variables" (p.327). Hair et al. (2010) suggest that, in order to examine the underlying pattern or relationship for a large number of variables and determine if the information can be condensed or summarised in smaller set of factors or components, a factor analysis can be utilised (p.233). A factor analysis explains underlying meanings and the correlation among a set of variables (Malhotra and Birks, 2009).

KAISER-MEYER-OLKIN MEASURE OF SAMPLING ADEQUACY (KMO)

The alternative and in fact most popular method of examining the correlation is the Kaiser-Meyer-Olkin measure of sampling adequacy (KMO), developed by Kaiser in 1970. The KMO can be calculated for individual and multiple variables and represents the ratio of the squared correlation between variables (Field, 2009). The KMO statistics vary between 0 to 1. A value of 0 indicates that the sum of the partial correlation is large relative to the sum of correlation, indicating distribution in the pattern of correlations (thus, the factor analysis is likely to be inappropriate). A value close to 1 indicates that patterns of correlation are relatively compact and so factor analysis yields distinct and reliable factors (Kaiser, 1974). Hutcheson and Sofroniou (1999) recommend accepting that values of KMO greater than 0.5 are barely acceptable, values between 0.5 and 0.7 are mediocre, values between 0.7 and 0.8 are good, values between 0.8 and 0.9 are great and values above 0.9 are excellent.

a,b		a	b
KMO and Bartlett's Test		Bangladesh	UK
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.743	.772
Bartlett's Test of Sphericity	Approx. Chi-Square	1503.950	.947.876
	Df	153	153
	Sig.	.000	.000

Table-1: *KMO and Bartlett's test on the Statement of Attitudes*

a. Only cases for which Nationality = Bangladeshi are used in the analysis phase.

b. Only cases for which Nationality = British are used in the analysis phase.

A principal component analysis (PCA) was conducted on the 18 items with varimax. Table-1 shows that the overall value of KMO for the set of 18 variables was .743 for Bangladesh and .772 for the UK which shows that the correlation is quite large and verifies the sampling adequacy for the analysis. The approximate chi-square test was 1503 (Bangladesh) with degrees of freedom of 153, which is significant at the level of .05 levels. Bartlett's test sphericity for Bangladesh is $X^2(153) = 1503$ and for UK $X^2(153) = .948$. A significant test tells us that R matrix (correlation matrix) is not an identity matrix and therefore there are some relationships between variables. The result for Bartlett's Test of

Sphericity for both countries was highly significant, $P < .001$, and therefore factor analysis is appropriate on the set of variables.

RELIABILITY

The Cronbach's reliability coefficient alphas for the Bangladesh sample fall between .776 and .888 (Table-2); on the other hand, those for the UK sample are between .721 and .858 (Table-3). The reliability tests of both samples suggest that the reliability is adequate and acceptable. A 5-point Likert scale was developed to measure the constructs in all five factors (1= strongly agree, 2=agree, 3= neither agree nor disagree, 4= disagree, 5=strongly disagree).

SELECTION OF ROTATION PROCEDURE

By using the rotation, the relationship between the variables becomes much clearer and the interpretability of factors can be improved through rotation. Rotation maximises the loading of each variable on one of the extracted factors whilst minimising the loading on all other factors (Field, 2009).

NAMING THE FACTOR LOADINGS

Variables with higher loadings are considered more important and have greater influence on the name or label selected to represent a factor (Hair et al., 2010). The ability to assign some meaning to the factors, or to interpret the nature of the variables becomes an extremely important consideration in determining the number of factors to extract (Hair et al., 2010). The process of naming the factors involves substantive interpretation of the pattern of factor loadings for variables, including their signs. Hair et al. (2010) suggested that before interpretation, a minimum acceptable level of significance for factor loading must be selected. The factor solution was derived from component analysis with Varimax rotation. The cut off point was set somewhat low - factor loadings $\pm .5$ or above in order to illustrate the factor interpretation process with as many significant loadings as possible.

ROTATED COMPONENT MATRIX - BANGLADESH

From Table 2 below we can see that five discrete factors have emerged from the set of variables and each one has an underlying meaning concerning the attitudes towards face concept. Factor 1 represents that there are four components that have high factor loadings (shown in bold type), factor 2 represents five components, factors 3 and 4 represent three components and factor 5 represents two components. In order to name the factors it is necessary to recognise the significant loadings; and the

variables with higher loadings influence to a greater extent the name or label selected to represent a factor (Hair et al., 2010).

ROTATED COMPONENT MATRIX – UK

The Table-3 below represents the rotated components matrix for the United Kingdom by four factor solution. Five factors have been extracted from the 18 statements of attitudes. The sample size of 142 (usable questions) is shown in Table 3. The factor loadings greater than ± 0.50 were considered statistically significant. From Table 3 it can be seen that for factor 1 there are four components with high factor loadings; for factor 2 - three components, for factor 3 - four components, and two components for both factors 4 and 5.

Countries	City	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5
Bangladesh	Dhaka	Thoughts in cosmetics purchase	Brand link to social recognition and prestige	Skin colour link to authority in society	Group conformity	Personal-self
United Kingdom	Hampshire	Brand link to personal satisfaction	Skin colour link to authority in society	Group conformity	Thoughts in cosmetics	Personal-self

Table-4: The labels of five extracted factors within the two countries

In Table 4 above there are five factors related to face consumption: thoughts in cosmetics, brand link to social recognition and prestige, skin colour link to authority in society, group conformity and personal-self, which have been identified for both Bangladesh and the UK. For Bangladesh, Factor 1 represents 'thoughts in cosmetics' whereas for the UK it represents 'brand link to status'. Factor 2 for

Bangladesh emerged as 'brand link to social recognition' whereas 'skin colour link to authority' emerged as the second factor for the UK. 'Skin colour link to authority' was the third factor for Bangladesh, while for the UK 'group conformity' was the third factor. 'Group conformity' appeared as the fourth factor for Bangladesh while for the UK 'thoughts in cosmetics' emerged. Factor 5, 'personal-self' has emerged for both countries.

It has been argued that female Bengali consumers are more influenced by the concept of face than their female counterparts in the UK. On the factor 'process of thoughts in cosmetics' Bengalis females scored $m=1.801$, whereas British females scored $m=3.354$, which represents a significant difference, $t=7.8394$, $P<.001$. The second factor, 'brand link to social recognition', indicates that Bengali females $m=1.376$ more strongly relate brands to their social face (i.e., social recognition, sense of being sophisticated and fashionable and social recognition of the choice of purchase) than British females $m=3.394$, ($t=11.2539$, $P< 0.001$) which therefore represents a significant difference. The third factor, 'skin colour link to authority in society', represents that Bengali consumers ($m= 2.320$) are more likely to consider fair or lighter skin as associated with prestige and authority in society than the way British consumers negatively associates ($m= 3.882$) tanned skin with prestige and authority in society, $t=7.6032$, $p<.001$. The fourth factor 'group conformity' indicates that the purchase decision of female Bengali females ($m= 2.355$) are strongly influenced by the family members' and peers' opinions whereas British females ($m=4.310$) are strongly opposed to the group conformity influence in their purchase decision which shows a significant difference $t=9.2609$, $P< 0.001$, between the two groups.

On the fifth factor, 'personal-self', both Bengali ($m=1.610$) and British females ($m=1.855$) scored low which indicates that there is no significance difference, ($t=1.5924$, $p>.05$, ns) between the two nations in terms of the influence of personal-self on purchase decision.

Results of hypothesis testing:

The results in Table 5 represent all four factors (apart from 'personal-self' which scored high among both nationalities) showed significant differences between Bangladesh and the UK. Therefore, based on this evidence, the first hypothesis *'Female Bengali consumers are more influenced by the concept of face-saving than their female counterparts in the UK'* is accepted.

Construct	Bangladesh (n=150) (Mean)	United Kingdom (n=142) (Mean)	<i>t</i> value	<i>p</i> value
1. Process/thoughts in cosmetics	1.801	3.254	7.8394	0.000
2. Brand link to social recognition	1.376	3.398	11.2539	0.000
3. Skin colour link to authority	2.320	3.882	7.6032	0.000
4. Group conformity	2.345	4.410	9.2609	0.000
5. Personal self	1.610	1.855	1.5924	0.112

Table-5: Results of hypothesis testing

CONCLUSION

The 'concept of face' is an important value in a high collectivistic society in which people's thinking process, shopping behaviour, brand perceptions and overall lifestyle are strongly connected with the notions of having respect for others, gaining face in society by achievement and power, greater importance of considering the opinions of important referent others (IROs) and judging the 'self' through IROs which are tremendously involved in the process of controlling people's behaviour in society. International and multinational companies with an intention to enter, operate and market their products in Bangladeshi market, when endeavouring to understand Bengalis' behaviour from cultural point of view for a sustainable business and to segment their target customers with the right approach, should seriously consider the propensity of 'face-saving' and its enormous impact within Bengali society.

FROM A HOBBY TO AN INTERNATIONAL BUSINESS MINIMAL CORK CASE STUDY

Pestana, Carolina; Meneses, Raquel

Faculty of Economics, University of Oporto, Oporto, Portugal

ABSTRACT

This paper aims to study the company Minimal Cork and its path from a hobby into an international business. Beginning as personal interest - in developing minimalist home decor products handmade with cork and other recycled materials, it became a business appreciated overseas. In this paper this path will be exposed with the main goal of supplying the required information for the development of future strategies aiming the business development. The analysis of the company will be focused on the entrepreneurial traits of its management team through a close look into its actions, including the decision-making process, creation and production processes, marketing strategies and main problems the company faces. The concepts involving the knowledge acquisition process and the entrepreneurial traits will be considered in this study since they play a crucial role in this company's activities and evolution.

Keywords: *hobby; business plan; strategic drift; entrepreneurial traits; case study*

INTRODUCTION

The foundation of a company is the first main step in the process of becoming a successful enterprise and making the best decisions in an initial phase is the best way towards that. The establishment of a company requires, first of all, an idea. This idea will be the ground for the development of an entire business so it must be well defined and planned in order to support its development and all the phases it will have to pass through - the best and worst of them. Hingston (1993) supports the idea that a new business should start by the formulation of a business plan with the main goal of serving as a guide through the process and keep the company in its initial trail even if it has to adapt to circumstances along the way. However, as we will see later, at the conception phase the majority of small companies do not have a business plan, i.e. circa 80 percent of the companies studied by Nayak and Greenfield (1994). This factor is the result of the different founders' background, motivations, aspirations, goals and available resources. The need for external financial aid is one of the main reasons why small companies do a business plan – they need to in order to be granted a credit. But what happens when companies do not need financial aid? When all decisions depend on the founder or CEO how does the

company behave? These are the main questions that will be discussed in this paper and in order to do that we will take into consideration the case of the Portuguese company Minimal Cork.

Minimal Cork is a Portuguese company founded in 2013 by architect António Brito. Counting over 200 projects in Angola, Brazil, Mozambique and Portugal, the founder - and only owner of Minimal Cork, started this project as a hobby, never thinking it could become an international business. As seen before the motivations for the business establishment play an important role in the company's future, and so do the entrepreneurial traits of the founder or CEO - in this case study the founder is also the CEO. What influence do the top managers have in the company's behavior? Is it possible to separate the management team behavior from the company performance? These are some of the questions that will be discussed in the study of Minimal Cork and hopefully it will enable the understanding of the relationship between the entrepreneur and the company's development.

LITERATURE REVIEW

The main purpose of this section will be the clarification of the elements that will be incorporated in the case study analysis. In order to understand the company's creation and development it is crucial to dedicate some time understanding its origins and organizational characteristics, focusing on the entrepreneurial traits and motivations of the founder that will influence the path from a hobby into a business.

Nowadays, the development of new technologies such as the internet and new communication systems promote the improvement of work conditions and allowed the existence of more flexible career and employment paths, leading to the creation of new business and work models (Hill *et al.*, 1998). These technological and work improvements encouraged the creation of new business models enabling employees to use their out of office hours to dedicate themselves to other activities, being called part-time entrepreneurs (Folta *et al.* 2010). This concept already considers the transition of an activity from a hobby into a business, even if it is not a full-time activity. Folta *et al.* (2010) during the analysis of Swedish entrepreneurs established the existence of three groups of part-time entrepreneurs: those who start their venture to supplement their wage income; the ones that start their venture to gain nonmonetary benefits; and those who regard their part-time venture as a step towards full-time entrepreneurship. This classification considers the entrepreneur's motivations and goals for the activity while still in an early stage of the business creation. A part-time entrepreneur can be a way to analyze the market opportunities before committing at a higher level, adjusting the business to the customers' needs and testing the different possible paths with a low risk involved. According with the entrepreneur's intentions the business path will differ since each person will have a different input in the business and consequently lead the company into a specific route. This trajectory will be affected by

the entrepreneur's traits, motivations and goals and one way to perceive them is through the analysis of their business plan for the company's creation, if made in order to structure its organization.

According to Andersson (2000), Schumpeter distinguishes entrepreneur and decision-maker in order to differentiate each role played in the process. The entrepreneur is the individual that behaves in an entrepreneurial way presenting new ideas for products, processes or organizational matters. On the other side, the decision-maker is the one responsible for the decision-making process playing a role that must be mostly rational in order to lead the company into a sustainable path. The main difference between both roles is the emotional involvement that characterizes the entrepreneur – creating is a passion, and thinking rationally can be a liability for the creation process but is certainly crucial for the business development. Schumpeter also considers the entrepreneurs' motivations for internationalization, the decision-making process and the opportunity exploration as important factors in the development of the adopted strategies (Zahraa, Korrib & Yu, 2005). The entrepreneurs' traits will define the company's path, especially when the entrepreneur is responsible for the decision-making process, so when facing a strategic decision the entrepreneur will not follow a consistent path due to the lack of planning – leading to a possible strategic drift.

In 2000, while analyzing entrepreneurs' motivations, context and preferences, Svante Andersson concluded that there are three types of entrepreneurs each one will differently influence the strategy chosen, the company's performance and the industry it belongs to. Each entrepreneur's intentions and persistency in following certain strategies are crucial in the internationalization process (Andersson, 2000) and consequently, the company's success will depend on each type of entrepreneur traits. In table 1 it is possible to observe each type of entrepreneur and the matching characteristic behavior. The three types – technical, marketing and structural, are characterized according their vision over the internationalization process, the elements focused, sought markets, approach adopted, preferred entry modes and speed of internationalization. Technical entrepreneurs will focus their attention in the improvement and creation of products and processes in order to guarantee the company's differentiation giving low importance to the current market needs but predicting their future demands. The second type is the marketing entrepreneur that is focused in satisfying the market's needs and looking for the expansion of the business abroad. External relationships are highly appreciated since they represent opportunities to be notice in a bigger scope. The last type is the structural entrepreneur being the one that believes in the internal improvement in order to succeed in the external relationships. Taking risks is something very difficult and as a consequence these entrepreneurs are quiet, adopting an observational position of the market while internally preparing to operate in it.

Table 1 – Type of entrepreneurs

Type of entrepreneur	Focus	Type of market	Attitude	Entry mode	Speed
Technical	Product and processes development	Emergent	<u>Reactive</u> – demand dependent	Exportations and licensing	Does not look for external markets to enter, it's a consequence of its activity development
Marketing	Fill market gaps Distribution channels and brands	Emergent	<u>Pro-active</u> – seeks international partnerships and respects networks 'value	<i>Joint ventures</i> and <i>greenfield</i>	Rapid entry in external markets
Structural	Organizational structure	Mature	<u>Reactive</u> – it is not directly related to operational issues – implements organizational strategies	Mergers and acquisitions in order to have control over the organizational structure	Internationalization as a natural consequence of the company's evolution

Source Constructed by the authors based on Andersson's (2000) analysis.

The entrepreneur classification suggested by Andersson (2000) has been studied and developed and many other categories have been identified since then. The entrepreneurs' categorization allows academics and practitioners to study entrepreneurs' behavior and their different influence in the company strategy definition and implementation. Hurst (1995) explained that the innovation and vision aspects in new companies are crucial factors in its foundation, but in the business development they begin to be dependent of the knowledge acquisition and capability to learn and the adaptation to emergent strategies. These factors will be highly associated with the entrepreneurs' vision since it represents and defines the companies' actions along the way (Thomson, 1999).

Combining the motivations exposed by Folta *et al* (2010) with Andersson's type of entrepreneurs, it is possible to observe a conflict between classifications. While talking about nonmonetary gains where the individual aims to reach personal satisfaction, it is not possible to describe him or her as a marketing entrepreneur since this category involves market research and the elaboration of a business plan, something unusual among individuals looking for nonmonetary gains.

This is a pertinent study since it leads us to another important research led by Hambrick and Mason (1984, p.193): the Upper Echelons Perspective "The theory states that organizational outcomes-strategic choices and performance levels - are partially predicted by managerial background characteristics". Hambrick and Manson's (1984) research is focused on the personal biases, experiences and values of top managers in the understanding of a company's organizational behavior. The authors also stated that it is more assertive to analyze the top managers' team in the company's behavior study rather than the CEO as an individual (Hambrick, 2005). This research establishes a direct relationship between the top management team and the company's decisions influencing the company's behavior. The

entrepreneurial traits of an individual and the company's behavior – as it was possible to verify – are two aspects related. The traits besides influencing the formulation of a business plan will also define the company's path and its performance in the market as it is influenced by the entrepreneur and/or decision-maker.

In 1993 (p.30), Hingston stated that “one of the first steps in starting a new business should be the preparation of a Business Plan”. However, in a study conducted by Paul Greenbank (2000) the decision-making process in micro-enterprises was analyzed and he concluded that owner-managers of small businesses do not plan ahead their company's development. A large percentage of the studied companies, circa 80%, did formalized a business plan and the ones that had justified the planning has requirements to have access to financial aids, for example credit institutions and/or business angels (Nayak and Greenfield, 1994). Similar circumstances were verified in terms of market knowledge acquisition, where “most start-ups relied upon information they had collected informally over a number of years” (Greenbank, 2000, p.207). It is believed that there is a correlation between the business planning and a successful performance by the company, besides the mixed results obtained by Castrogiovanni (1996) while studying this relationship (Greenbank, 2001). The importance of the business plan is related to the knowledge acquisition process, one of the main processes in a business development included in the main internationalization theories and models – the Uppsala Model (Johanson and Vahlne, 1977) and the Network Theory (Johanson and Mattsson, 1988).

However, defined as “the process by which the entrepreneur, in exploiting an opportunity, creates a vision of the future and develops the necessary objectives, resources, and procedures to achieve that vision” (Sexton and Bowman-Upton, 1990, p.118) a business plan does not belong to many small companies milestones in its foundation phase. This factor is the result of each entrepreneur's background, motivations and aspirations for the business. Although Cooper (1986) defends that the planning of a business allows entrepreneurs to gain new knowledge – through market research, it does not compensate the prior low knowledge about it. It is necessary to gather information before the business creation in order to make the right questions and find the most suitable answers for that specific business (Dencker *et al.*, 2007). The formulation of a business plan will allow the founder to establish the main issues to deal with and the company's main objectives, but it does not grant an insightful view of the business world. Roudini and Osman (2012, p.127) indicated that “at the inception of the venture, entrepreneurial capabilities can be crucial to success, while these capabilities become less important and relevant as the venture matures” these capabilities are related to the role entrepreneurs play in the business development and the main traits identified. To understand these matters in a practical way it will be presented the case study of a micro-enterprise – Minimal Cork.

METHODOLOGY

The information used in this paper's case study was collected through interviews to Minimal Cork's owner and through the exchange of emails during the course of this paper development. The main acquired information can be characterized as secondary data since the information obtained was already available in the literature and existent similar case studies. Dealing with a case study the data used can also be categorized as secondary internal data – the information obtained through internal observation of the company's daily routines (Malhora & Birks, 2007).

The main purpose of this case study is to provide the necessary information to Minimal Cork and similar companies for the development of their business plans and sustainable strategies for companies' development. This is a case that must be studied considering its unusual origins – starting as a hobby, and its unlikely journey towards internationalization.

CASE STUDY: MINIMAL CORK

Inspired by the use of cork in architectural projects, and his special taste for minimalist products and alternative designs, António Brito started to create home decor products for his own fulfillment. Experiencing a decrease in his day job as an architect he began to create and produce handmade cork products such as lamps, placemats, bottle protections and others. Its success among friends and family led to the thought of founding a company dedicated to the creation and production of cork products and other recycled materials. Allying cork (a very Portuguese raw material) with an innovative design and environmental sustainability the project began to gain form and in 2013 Minimal Cork was created. At its inception Minimal Cork was just a way to turn a hobby into a legal activity – there was no need to develop a business plan, especially due to the fact that it is a self-financed project not requiring external credit. Being a one-man-company the decision-making process is simple and unstructured. The decisions are based on the perceptions of António Brito about each activity, partnership, sale and supply deal – it is an unstructured business. The creative process is defined as a marketing push strategy – the products placed in the market without any previous research and knowledge of the customers' preferences and receptivity. Creating these products is an intuitive process for António Brito and there is no concern for what the market needs since they are all innovative ideas – but who will buy those products? There is the idea that if they are good and innovative products the rest of the process is easy: place them in the market and let the product sell itself. This process had results, in an early stage, however the early success of the company drove António Brito to continue its business in an unstructured way reaching a point where it is not possible, or sustainable, to evolve. This characteristic led to one of the main problems Minimal Cork currently faces - the strategic drift, raised from the lack of a business plan.

Before the case analysis - and for the comprehension of Minimal Cork's main objectives, it is important to look at its mission, vision and objectives. The definition of goals, and means to reach them, is considered one of the first steps into the business plan creation – and these were the only aspects already defined by António Brito:

Mission: *“The production of minimalistic designer items that allows our customers to experience innovation and eco-friendly products through the use of one of the most traditional raw materials – cork”.*

Vision: *“Making a difference through the potential use of cork in new sectors, becoming a reference in international markets for the innovation and sustainability associated with the products”.*

Values: *“Environmental concern, focus on customers' needs, center on creativity, diversity and innovation are the principles that guide Minimal Cork in the pursuit of the desired results”.*

The established concepts constitute a foundation for the business plan development allowing the definition of objectives and the identification of potential strategies to adopt but first, in order to succeed abroad the company needs consistency in its activities and internal organization.

Firstly, in order to create an internationalization marketing plan Minimal Cork needs to develop a business plan to serve as the basis for its internationalization objectives. Without a structured strategy in the domestic market it is difficult to operate overseas where the competition is much stronger and the rapid adaptation to new circumstances is a must. As previously established by Andersson (2000) the company's future will be highly influenced by the entrepreneurial traits of the decision-maker. In this case study the entrepreneurial traits of António Brito will be considered since he is the responsible both for the creation and production processes and for the organizational structure of the company.

The development of handmade products with designer author and unique raw materials made clear for the owner that these were premium products and its target market was a niche market. Even exhibiting the products in local markets there the need to place them in an appropriate market was evident considering the competition existent in the sector where few large players have the majority of the market share (e.g. IKEA, Zara Home). In order to expand the business the company decided to associate itself with Faculty of Economics – Oporto University accepting an intern to help the process. However, to be able to work on the internationalization of a company it is required to have a structured strategy to sustain the expansion process. This was a starting point for the company since it would allow the acquisition of management and strategic knowledge – representing the professionalization of the company, since until that point the company's members were from creative backgrounds with low strategic experience in terms of launching an innovative company. However, the acquisition of strategic

management does not mean operational improvements if those same resources are not acquired. The formulation of a business plan was a priority and until then not knowing its important role in a business development the company was lost in unstructured decisions and adrift in the market. The products were created and produced without any defined destiny, no price policy, distribution channels or even a notion of the target. This uncertainty and lack of results led to the thought that the Portuguese market was not the right one for these products. Since they were so good but there were no sales in Portugal, it was logic to think that it was a market problem, so the solution was to go abroad and enter international markets. Not having the knowledge to make those changes, by the acceptance of external help provided by the university, Minimal Cork showed the willing to improve and that is one of the main motivational characteristics that can lead to a change in the company's performance and future development.

Minimal Cork faces the competition of well established companies that represent a large percentage of the market share, namely IKEA and Zara Home. These companies offer simple and cheap solutions competing in the market through cost penetration strategies. Considering the dimension of the main players it is required that micro-enterprises focus their businesses targeting niche markets. Due to its strategic drift Minimal Cork is not able to identify its target, having so far a broad range of customers. Through the use of virtual networks as Facebook and its website, the company managed to implement online marketing campaigns, however, not having a specific target the costs were high and the return non-existent. The creative enthusiasm of the founder and lack of management experience led the company to invest in the wrong strategies as a result of non-existent planning and eager for fast results – the result of the emotional relationship of the founder with the project. Being a company created without any external funds it is strategically independent which in this case constitutes a weakness for the company that does not have a balance between the emotional and the rational sides – crucial in the decision-making process.

DISCUSSION

As Hambrick and Mason's (1984) upper echelons theory suggests the company will behave as a representation of its top management members in this case as the founder member that having creativity as he's main characteristic does not help in the decision-making process, opting to follow the fastest way into the company's goals and does not consider its repercussions and sustainable development. In order to proceed with the business and evolve into international markets it is crucial to focus firstly in the internal organization of processes and resources to be able to support a sustainable business and enable the company to adapt itself when facing international competitors. Only through the definition of a business plan it is possible to keep focus and develop a business with Minimal

Cork's potential. The entrepreneurial traits should not be considered as a liability for the company development, it must become one of the company's competitive advantages, but in order to do that entrepreneurs must be willing to adapt and constantly learn from and with the market (Thompson, 1999). The formulation of a business plan should not be optional in the creation of a new business since the incubation phase of a new venture can be a success but from there many of the adversities the company will face will not be predicted and the existence of a business plan, as defended by Greenbank (2001) will give managers the right tools to proceed with the making of the best decision possible.

CONCLUSIONS

This case study represents many micro-enterprises that find their way in the domestic market without a planned strategy and realize its potential to grow but not knowing how to operate in the domestic market consider to expand their business abroad. However, there is a current misconception in small companies where it is believed that if the business it is not growing in the domestic market entering external markets is the solution – it is not. In order to be able to operate abroad a company must be able to face the domestic competition and know how to show its differentiation factors in the market. Being different and innovative does not mean that once in the market the concept will spread, it is required many strategic actions in order to be recognized by the customers and gain other companies respect and loyalty – both suppliers and resellers. Not having the direct influence of external entities – as credit institutions, Minimal Cork has total control over the decision-making process which can be an advantage if the top management team has experience in the business, and that is not the case. Independency in this company is faced as a disadvantage not pressuring the company to plan its actions ahead – allied with the management emotional connection, constitute the main factors responsible for the company's strategic drift. Dependent on the founder's decisions the company is more vulnerable to the market variations – accentuated in the international market, and although it has potential to grow in and outside frontiers it needs to balance the emotional and rational sides while making decisions that will affect the company's future, either in a short or long period of time.

The analysis of this case study enables the reader to understand the strategic issues that small companies face at an early stage and the influence its characteristics have in its development such as its origin, entrepreneurial background, motivations, aspirations and goals. The creation of businesses is a phenomenon that has been growing in the last years as a solution to the high unemployment rates in Portugal. However, it is important to somehow, obtain management knowledge to sustain that business since its creation is easy and encouraged by public entities – meaning more companies in the market and a higher need to differentiate and be able to face such competition.

Hopefully this case study will encourage further research involving the origin of small companies and its effect on the companies' development. It is important to understand the correlation between these two aspects and develop strategies to help small companies born from someone's passion and talent into businesses with high potential. It is important that more companies grow an emotional side in the decision-making process but the ability to maintain the rational side is not request, is mandatory for its success.

GLOBAL CORPORATE GOVERNANCE: THE MAELSTROM OF INCREASED COMPLEXITY - IS IT POSSIBLE TO LEARN TO RIDE THE DRAGON?

Philipson, Sarah¹; Johansson, Jeaneth²; Schley, Don³

ABSTRACT

In the light of recent corporate scandals company failure is usually explained based on agency theory, leading to the conclusion that corporate boards and regulators must use agency theory to control management better.

The authors use institutional theory to problematize this advice. We identify the role of accounting as to give predictability, hence preventing company failure. But this predictability can be questioned; it implies stability. Albeit partly with circumstantial evidence, we question this stability with factors making the conditions for management decision-making volatile, as explained by antecedents, and leading to unmanageable entities. The implications of this volatility have consequences for corporate governance, and question the going-concern assumption, the basis of accounting.

Hence, from the dominant explanations that corrupt management, or management with different interests than the principal, leads to company failure, we evolve another chain of cause and effect: volatility, with company failure as a result. It is argued that traditional accounting rituals are unsuitable for many companies. The paper indicates a need for de-institutionalization and reconsidering of accounting practices, and particularly the fundamental assumption of going concern.

Keywords: *complexity, corporate governance, going-concern, management control, innovation, volatility.*

THE PROBLEM – COMPANY FAILURE

With a background in scandals, such as Enron, WorldComm, Vivendi, Adelphia, Tyco, Global Crossing, this article reflects on how and why uncertainty and complexity in the management of firms may create problems of management control that spills over on the potential of corporate governance. Twelve of the 20 largest bankruptcy filings in the U.S. history took place in 2001 and 2002. All 12

companies received an unqualified opinion on their most recent financial statements filed prior to the bankruptcy filing. (Carnegi & Connell, 2014; Uang *et al.*, 2006; Venuti, 2004). In response to the frustration with corrupt, or seemingly corrupt management, management cultures, or failing information systems, Palmer (2013:5) suggests that “...new emerging theory and research on organizational wrongdoing present a fundamentally different perspective. It views *wrongdoing as a normal phenomenon*...” [our emphasis] Another explanation is that management fail to see the information necessary because of taboos: “Fear can blind us: it is often impossible for an organization to acknowledge the biggest risks it faces, including extinction...” (Schoemaker & Tetlock, 2012:7). Hence, we need to find methods to lift the fog of the taboos. A third approach recognizes that “Estimating a volatile future value is a fundamentally different task than making a forecast in stable market conditions.” (Haran & Moore (2014:6-7), but proposes that this can be resolved by a method that gives better accuracy and greater flexibility for the decision maker. These largely “internal” perspectives on the causes of company failure identify the principal antecedences of company failure in structural issues within the company, rather than in managers themselves, which is often the popular explanation. The latter explanation has caused voices to be raised for further control of management. This paper discusses limits of current management control systems. Focus is on the boundaries of information limiting the control of management and the possibility of improving corporate governance. Critique against failures due to fraud are typically theoretically inspired by agency theory, in terms of opportunistic behaviour and strong incentives for moral hazard, while cultural aspects, such as institutional mechanisms are less common. Agency theory is based on pessimistic assumptions of management behaviour and actions (Ghoshal, 2005; Hirschman, 1970).

In this paper we question the thoughts that are hegemonic in the fields of accounting. One such institutionalized assumption connected to the most central change that may take place in an organization that ceases to exist, i.e. the going concern assumption is reflected on. The management control perspective of agency theory may contribute some knowledge for management control, with implications on corporate governance, but it is not sufficient. Management’s decision processes are exposed to problems of adverse selection; such problems are here reflected on from the perspective of institutional theory. We argue that the problem of adverse selection, due to high information asymmetries, may be a central part of the explanations of corporate failure. We base this on arguments of institutionalized structures and information boundary spanning, causing problems for management control, and hence corporate governance. By adopting an institutional perspective, we challenge the rituals used in accounting, and the roles such rituals have in the institutionalization of behaviour for maintaining social cohesiveness. We argue that companies are sustained by the rules governing them, and by institutional mechanisms supporting conservative behaviour, rather than by

real needs of management, whom they purport to serve in the management control. This paper draws on the discussion of accounting relevance of the current accounting assumptions for use in management control that results in consequences for corporate governance and ethical considerations.

METHODOLOGY

We problematize the explanations provided by the dominating theoretical paradigm, agency theory, with the help of institutional theory. Pertinent tendencies, shown by incidental evidence, question the very foundations for the possibility to manage present corporate entities. This is argued to have fundamental consequences for the going-concern assumption; the foundation for accounting.

LITERATURE REVIEW

The Going Concern Principle, as Part of the Accounting Rituals

The going-concern concept, considered as the accountant's firm model, is a central part of accounting rituals. Accounting started as the control of short-term (4 - 6 years) projects, such as ship-borne trading voyages to the Far East. The principle of the "going concern" was introduced in the Middle Ages, when trading trips became recurrent. Liquidation of assets after each voyage seemed costly and ineffective in cases where the same investors were involved. The principle of the going concern enabled continuity in business transactions (Sapori, 1970). For the company to survive in a long-term perspective, this principle implies that the company's operational payments need to be lower than cash generated (Coyle, 2000:125). The assumption of the going concern is fundamental to accrual accounting and has a direct connection to historical cost valuation (Venuti, 2004). This assumption justifies revenue recognition and matching principles, the allocation of costs over periods benefited, historical cost accounting, and the classification within the balance sheet (Fremgen, 1968:649). Yet what if this assumption no longer holds?

The basic concept of the going concern and its attached accounting rituals has been relatively unchallenged in accounting. The axiom is a cornerstone in accounting, where the myth of the going concern realms of the past and the present holds for estimating the future, and where also the present becomes contiguous with the future (Cooper *et al.*, 2001, Koh & Low, 2004; Sterling, 1968). However, there are shortcomings with the concept of the going concern, which need further elaboration. Such shortcomings are connected to environmental circumstances, behavioural implications by management, as well as auditors, due to their ability and willingness to disclose going concern opinions, and finally conceptual un-clarity in the definition of the going concern.

One weakness of the going concern concept derives from contemporary changes from stable business environments, with long product and business life cycles, to rapidly changing cycles in

dynamic business environments. The going concern principle is as such considered as a functional model of businesses in stable environments, and has been central in the development of the industrial production. Edwards & Bell (1979:15) wrote: “...*lacking evidence to the contrary the business entity has an indefinite life; continuance rather than imminent liquidation is the reasonable expectation.*” (italics in the original). The business environment has changed, however, and over the last few decades new market conditions and technological advances have come to characterize the dynamic environment. Product life cycles are no longer be measured in 50 or 100 years, often not more than 3 to 5 years and some not more than a couple of months (as with mobile phones). Even underlying business models, technological platforms, etc. have shorter and shorter economic life-spans. (Schumpeter, 1947)

Weaknesses in going concern statements are connected to behavioural implications, due to company management. Venuti (2004) considers weaknesses in management disclosure and auditors an issue of going concern opinions. The future is genuinely unpredictable for management, when assessing the company's potential of future survival, due to changes in the environment. Decisions made are typically based on a limited number of variables that give logic and structure to our judgments and that simplify continuous recalculations of our guesses. (Kahneman & Tverskys, 1984; Simon, 1955) Disclosure of information on firm failure, where the going concern assumption is questioned, may become self-fulfilling and receive severe behavioural implications, causing actual company failure (Frost, 1997; Venuti, 2004). Managers appear to be particularly reluctant in voluntarily disclosing going concern information in financially distressed situations, causing biases in disclosed information that influence the quality of company information (Mutchler, 1985; Uang *et al.*, 2006). In line with this reasoning, managers have incentives to disclose trustworthy information to sustain company reputation (Healy & Palepu, 2001, Skinner, 1994; 1997), but also incentives not fully to disclose all information, due to reputational concerns (Balachandran & Nagarajan, 1987; Kothari *et al.*, 2005), and to preserve competitive advantages (Johansson & Malmström, 2013). Nevertheless, dysfunctional management disclosure behaviour has been suggested to be managed by robust corporate governance mechanisms, where the mechanisms aim to improve the quality of the going concern disclosure. Such considerations touch upon management's *willingness* to disclose information on the going concern, while management's *ability* to disclose such information is another side of the coin that has not been thoroughly addressed. The lack of mandatory management disclosure of the company's ability to carry on as a going-concern has been criticized (Venuti, 2004).

Weaknesses in going concern statements are connected to behavioural implications, due to auditors. Auditors' work with assessment and disclosure of going concern opinions is central in auditing, and as such among the trickiest parts of the auditors' work (Arnold *et al.*, 2001; Louwers *et al.*, 1999). The quality of auditors' going concern opinions and their ability and willingness to disclose

such opinions, has been questioned; both for their disclosure of opinions for companies that do not fail, and for not disclosing opinions on failing companies (Citron & Taffler, 1992; Geiger & Raghunandan, 2002; Tagesson & Öhman, 2015). Management reluctance to disclose reliable information causes information asymmetries that spill over on auditors' ability to disclose reliable going concern opinions (Uang et al., 2006). Auditors' opinions are ambiguous and appear to differ in clarity and distinctness. Auditors disclose subtle signals on the going concern that may not be anticipated by all stakeholders, where ambiguous or implicit statements are used by auditors, as strategies to deal with the sensitive situation of causing liquidation through the disclosure as such (Arnedo *et al.*, 2008; Carcello & Neil, 2003; Tagesson & Öhman, 2015). Going concern expectations appear to be disclosed to late, both by company management and by auditors. Finally, weaknesses in going concern statements are connected to the conceptualization of the going concern concept. Uncertainty in its definition causes different interpretations and misunderstandings of the concept as such (Venuti, 2004). Words such as "significant" and "substantial", used in definitions, are ambiguous and may cause different interpretations. There are a number of key performance indicators that may be used for assessing potential going concern problems for companies and their business models; both company specific and industry specific indicators. Historical short-term and long-term information on financial and non-financial aspects are used for capturing historical trends, such as revenues, capital sources, and access to cash and funding. Information on the industry, competitors and the economy and how such factors impact the company's future potential are also included in the assessment. Such information may be difficult to access, but also to analyse and draw conclusions on.

Management Control and Accounting as Myths of Predictability

A cornerstone of accounting is to reduce uncertainty, through a casual understanding of action outcomes in an uncertain business environment, when prognosticating an uncertain future (Cooper *et al.*, 2001). Management accounting is aimed at assisting management in the control of the business and in decision-making, i.e. aimed to be a part of the management control system (Cooper *et al.*, 2001). The business becomes visible for management through the construction of selectively produced images, enabling measurement (Hines, 1988). The management control system and the underlying basis of accounting, encapsulate myths of predictability that enable the creation of images of the organization, the decision-making within the organization, and the future of that organization. (Cooper *et al.*, 2001:143) In line with this reality, accounting practices serve cultural purposes of justification, based on mythical rituals, where organizations and members become unified, reaching a common focus of the future (Latour, 1987).

The rationality of accounting predictability may be challenged (Cooper *et al.*, 2001), and we argue

that this is in particular true in an era of turbulent change, where such profound limitations may cause severe risks of bankruptcy. Accounting involves dominant conceptions of reality that are shaped and reinforced by institutional mechanisms of management control, aimed to create shared logics and understanding of what are appropriate organizational structures and practices (Meyer & Rowan, 1977). An appropriate way of working and acting is established (Boxenbaum & Jonsson, 2008; DiMaggio & Powell, 1991; Greenwood & Hinings, 1996:1027; Meyer & Rowan, 1977; O'Neill *et al.*, 2015). Institutionalized thoughts and actions are rooted in rituals and routines, where the accounting rituals are used in decision-making – for instance in the assessment of measures as performance and for legitimization of decisions in front of stakeholders. (Cooper *et al.*, 2001:143).

PERTINENT TENDENCIES

Complexity – Unmanageable and Unstable Entities

Capitalism has become more volatile as the compound result of several multi-collinear tendencies: Shorter Product Life Cycles, Wintelism, Changed Product Cost Structures, and Monopoly Rent. Some of these have only lately become manifest, and we can only give circumstantial evidence, as the validation of each of these comprise a research agenda in themselves.

Shorter Product Life Cycles

An element in the increasing complexity that faces management is found in the rapidly shortening life cycles of products. At the end of the 19th century the life cycles of products (services or experiences) were 50 - 100 years. Innovation was not a big issue. *Product life cycles have become much shorter. After the WWII, 20 years, and today only 3 years for many products.* Chesbrough (2007:24) states: *“In the computer industry during the early 1980s, for example, hard disk drives would typically ship for four to six years, after which a new and better product became available. By the late 1980s, the expected shipping life had fallen to two to three years. By the 1990s, it was just six to nine months.”* – However, in mature industries that have not yet suffered from substitution competition, the life cycles are still long. To **replace lost business** to retain the same size of the company, the 1900 firm had to launch products that could replace 2% of its business each year. At the end of WWII, with an average life cycle was 20 years, products that could replace 5% of revenues had to be launched each year. 1985 the average life cycle was 7-8 years. Hence, 12,5% new products had to be successfully launched each year. Today, with an average life cycle of 3 years, one third of the business is **up for auction every year**. With a failure rate of innovations of at least 100%, (Evanschinsky *et al.*, 2012; Van der Panne *et al.*, 2003), and a needed 10% yearly growth, it is clear that managers of highly successful companies do not necessarily know if the firm will exist at the end of the year! *Since innovation is risky, the firm might need a product development portfolio that is as large as the current turnover, or even more!* (Van der Panne *et al.*, 2003).

Wintelism

To be able to develop new products in a short time, the shorter life cycles have made a new outsourcing model necessary. "Wintelism" was introduced as a concept to describe a new phenomenon that emerged after an antitrust decision against IBM in 1980. IBM was forced to outsource its component manufacturing, in the hope of the authorities to create competition. Instead of the traditional outsourcing model, IBM chose only to specify the input and output of components, leaving the supplier to decide the necessary transformation. (Borrus & Zysman, 1997; Hart & Sangbae, 2002; Tan, 2002)

Less design work, faster design. As a consequence the buying firm does not need to "design" (innovate, product develop, construct) every detail of a product, only the "product architecture" at a "high" level of the product structure. This approach makes it is possible to *develop in shorter time*, which is very important with shorter and shorter life cycles.

Increased competition among suppliers. Since the firm only has to specify the function of the component (input - output), it is possible to *transfer* the necessary *information* simply and inexpensively, e.g. by a web page, to many more suppliers, increasing the competition among suppliers. Often thousands of suppliers, rather than as before some ten, can be invited. It also becomes less expensive to *evaluate* the offerings of the suppliers. And the firm does not need to transfer detailed (and proprietary) knowledge to the supplier that has gained the bid – the supplier knows best how the component shall be produced.

The Unleashing of Creativity. The prospective suppliers can use their creativity to invent radically *new solutions* that either give a much lower price, or higher performance, or new features – cf. Moore's law and the development of the computer industry since 1980 (Mollick, 2006).

The consequences of Wintelism are that it has opened up globalization (see below) of component production, radically increased productivity, and permitted firms to cope with the shortening time-frame left for the development of new products and services.

Changing Product Cost Structures

The cost structure has changed as a consequence of the above- mentioned tendencies. Generally, during the short life span of products, it is hard to change production to make it more effective. Decisions need to a large extent be taken *before* the launch of the product. While a hundred years ago some 90% of costs were variable costs of production (direct labour, direct material, and various overhead costs in the manufacturing process), these are now typically 1-15% (2% for a music CD, 7% for a branded T-shirt; 10-15% for a mobile phone, or a personal computer). To maximize revenues in a shortened life span of products, firms are also forced to address target groups on a global scale. The effects of which are that the cost of marketing, as a share of the product's cost structure, has been

increasing. The large cost elements are now *fixed* production costs and *fixed* marketing costs: the costs for developing the product architecture of the computer; its operative system, some "basic" applications; the organization, and the evaluation of the value chain, are now together the lions share of the production costs. *These costs are incurred before any revenues are assured.* (Kurawarwala & Matsuo, 1996). Hence, a failure in the launch of a product has more profound effects, as the firm has to pay these costs upfront. Chesbrough (2007:23) states that an important factor spurring the process of open innovation is "...*the rising cost of technology development...*" in many industries. [our emphasis]. He also gives examples from Intel and Proctor & Gamble, where these costs have increased 5 to 100 times over the last 20 years.

Monopoly Rent

Innovation makes it possible to reach Abnormal Earnings, AE, during the time that the innovation has not been imitated by competitors. Monopoly rent was used by Malthus (1798/1970), Ricardo (1817/1971), and Marx (1894/1981) to explain land rent. Marx (1894/1981) explained AE as the result of the re-distribution of profit in relation to the organic composition of capital. Schumpeter (1942; 1947) applied monopoly rent to innovation, to explain how a temporary monopoly gives the innovating firm a competitive advantage. "Schumpeter argued that those who succeed at innovating are rewarded by having temporary monopoly control over what they have created. This control, in turn, is the lever that allows innovators to gain an enhanced position in the market and related temporary profits of "economic rents" from their innovations." (von Hippel, 1988:43, 58). In the accounting literature AE is normally measured by the neo-classic Ohlson model (AbuGhazaleh *et al.*, 2012; Bernard, 1995; Feltham & Ohlson, 1995; Lo & Lys, 2000; Lundholm, 1995; Ohlson, 1995), which calculates the value of the firm as the net present value of future abnormal earnings. The Ohlson model updated the Gordon model (Gordon & Shapiro, 1956) with the Miller & Modigliani model (Miller & Modigliani, 1961). "Abnormal earnings bear on the difference between market and book values, that is, they bear on a firm's goodwill." Ohlson (1995:662). However, the very fact that the model recognizes abnormal earnings is a fundamental conflict within neo-classical theory, as it abstracts from the fundamental assumption of perfect markets. The Ohlson model is one of the most cited and respected models in the accounting literature, but it has one major flaw: although the Ohlson model is an empirically well-validated prediction model, it fails to explain *why* these abnormal earnings can exist. Classical economics gives such a fundamental explanation. The result of these abnormal earnings is rapid, unforeseen changes. In mid-2007 Nokia retained 60% of the profits in the mobile phone vendor market. Then Apple introduced the iPhone. Four years later, Apple had 75% of the profits and Nokia zero! In 2013 Nokia ceased as an independent mobile phone manufacturer (Asymco, 2011). From being the leading and dominant player it was forced out of the market in 6

years. "...it can always be understood *ex post*; but it can practically never be understood *ex ante*...", Schumpeter (1947:150).

Organization researchers have long recognized "*pockets*" of *uncertainty* in organizations (Argyris, 1993; Argyris & Schön, 1978; Cohen, March & Olsen, 1972; March & Olsen, 1976; Pettigrew, 1990; Senge 1990; Weick, 1979; as summarized by Gabriel, 1998). We propose that *uncertainty has become generalized* and that we now only find *pockets of certainty*. In the accounting literature, such chaotic-ness has only been recognized lately and only in texts that have had marginal impact on "mainstream" accounting (Cooper *et al.*, 2001; Gabriel, 1998), or risk management (Power, 2009). Abu Ghazaleh *et al.* (2012) show that the goodwill of the companies listed at the London Stock-Exchange surpasses that of their equity. This means that if one questions them as going concerns, they are forced to liquidate!

"Critical" historians of accounting theory, like Richard (2014) and Breyer (2014), although on a definitely different theoretical basis, agree that the going concern principle is the basis for modern accounting theory. Historical cost accounting, based on the going concern principle, is characterized as the capitalist accounting methodology par preference. (Breyer, 2014) Richard (2014:22), on the other hand, characterizes modern accounting as "reckless". While we agree with much of Breyer's criticism of Richard for not studying the real economic basis of changes in accounting theory, Breyer (2014:7) falls into the same trap, by identifying the problems as "...its pathology as a disease of social control, a growing problem of managerialism, that is, [the] increasingly unaccountable management.", making him a proponent of agency theory. In contrast we hold that the problem is that *the modern corporation has become unmanageable*. The going concern principle is not the very capitalist form of accounting, but the rational accounting in a historical period of relative stability in capitalism.

THEORETICAL FINDINGS

In today's complex and uncertain, global corporate operations, there is an increased need for management control, but that increased control is problematic, since it presumes that the main reason for corporate failure is dishonest CEOs and other senior executives, not that the reason for failure is their lack of control of the company! If the executives themselves cannot effectively control the company, the increased control of them might lead to the implosion of the whole system. In global corporations, with unrelated or loosely related businesses, this uncertainty gets multiplied, not weighted off. There is a clear risk that the priorities in corporate investment are wrong or short-sighted, when the corporation takes on diverse and unrelated activities (Philipson, 1980; Bettis & Prahalad, 1995; Grant, 1988; Lindqvist, 1979; Pehrsson, 2006; Prahalad & Bettis, 1986). With shortening life cycles we are *entering chaos theory, not business administration*.

And here we come to the crux of the matter. *Corporate financial officers, relying on obsolete accounting practices, are unable to understand, in any kind of timely fashion, what is really going on at the dynamic fringes of their empires.* They are thus compelled by the antiquated system, which they by tradition must employ, to manipulate the numbers to produce the sensible quarterly reports, demanded by law. Thus the accustomed practice is manipulation, not simply to provide data, so that manipulation becomes simply customary – merely a manner of doing business. Consequently, the ethical lines between normative practice and real ethical violations become obscured, if not blotted out entirely, in the minds of the practitioners. This reality leads to the kinds of financial scandals we have seen, and will continue to see, in our top organizations.

DISCUSSION AND CONCLUSIONS

The authors use institutional theory to problematize the dominant explanation that corrupt management, or management with different interests than the principal, leads to company failure. We identify the role of accounting as to give predictability, hence preventing company failure. But this predictability can be questioned; it implies stability. Albeit partly with circumstantial evidence, we question this stability and propose another chain of cause and effect: volatility, as explained by the antecedents of (1) shorter product life cycles, (2) Wintelism, (3) changed product cost structures, and (4) monopoly rent, lead to unmanageable entities, with company failure as a result. This volatility has consequences for corporate governance, and questions the going-concern assumption, the basis of accounting. It is argued that traditional accounting rituals are unsuitable for many companies.

We can conclude that concept of the going concern, as well as the disclosure and assessment of the concept, need to be critically reflected on, in terms of weaknesses and potential improvements. Since company management and audit opinions appear to fail to indicate going concern problems clearly and early and warn stakeholders, such as investors, we believe that accounting practices have to change radically (Tagesson & Öhman, 2015). Previous studies show that the long-term effects of reflected acting based on rituals result in limits of acting and thinking in organizations (Gramsci, 1929-1935/1971; Hedberg & Jönsson, 1978; Levitt, 1960). Management and auditors have information filters that need to be reflected on to be prepared for critical changes before entering into crises. There is a need for de-institutionalization and reconsidering of accounting practices and thus particularly the assumption of the going concern. Management and auditor reporting standards need to be adjusted to the current situation and conceptualization needs to become more specific (Arnedo *et al.* 2008; Tagesson & Öhman, 2015) The predictive ability of accounting may be challenged for enabling further improvement of accounting adjusted to contemporary business needs in an age of global

organizational chaos, not of global stability. (Cooper *et al.*, 2001).

ABSTRACT

The study aims to deepen knowledge on the Open Innovation (OI) approach, examining the specific context of Small & Medium Enterprises (SMEs) in the Wine sector. The focus is on how Wine SMEs organize themselves to sustain OI and to answer the matters that influence in opening/closing the approach to innovation. The work performs an explorative qualitative analysis using the case-study methodology and analyzes an Italian firm named Arianna Occhipinti. Although this firm presents an increasing interest in actions related to OI, the findings show that so far it has not put in place a real declared strategy. The study highlights several barriers that hinder the adoption of OI model: cultural and organizational differences among involved partners; lack of knowledge, resources and competencies. These barriers drive Wine SMEs to abandon or delay OI strategies. The findings suggest that open innovation is a field of increasing interest for both academics and practitioners and we cannot yet speak of a veritable declared strategy. It appears more like a set of fragmented initiatives and, moreover, at a beginning stage with several barriers that hinder a significant improvement.

Keywords: *Open Innovation, Wine, SME, Low-tech sectors, Case-study, Entrepreneurship.*

INTRODUCTION

The traditional view of management studies has strong ties with the closed innovation paradigm, where the organization's research and development (R&D) activities are considered strictly internal processes that should be guarded from external influence. Under this model, ideas should be produced in-house and the only way to market them is through the originating firm (Chesbrough, 2006). Conversely, the OI paradigm (Chesbrough, 2003) proposes opening up the firm's innovation processes, enhancing and supporting suitable collaborations with external actors to create, develop and commercialize innovations (Chesbrough, Vanhaverbeke and West 2006) in an increasingly interactive

environment, in which organizations should collaborate extensively, maximizing the efficiency of external knowledge exploration and exploitation (Chesbrough, 2003; Dahlander and Gann, 2010; Huizingh, 2011). The OI approach is mainly based on more porous and permeable firm boundaries, which allows organizations to employ both internal and external pathways to generate innovative ideas and to acquire knowledge from heterogeneous external sources. The aim is making the most out of the opportunities coming from collaborations with different parties outside the organizational boundaries (Chesbrough, 2003).

The focus on openness in studies of innovation is a relatively new area of research and it has been mainly dedicated to the analysis of large multinational companies in order to examine the main characteristics, the organizational challenges and the related benefits (Lee et al. 2010; Spithoven et al. 2010; Parida et al. 2012). Even though the investigation of innovation in SMEs is more recent (Bianchi et al., 2010), there is evidence of a strong correlation between Open Innovation and these types of firms (e.g., Roper et al. 2002; Baldwin and Gellatly 2003; Mansury and Love 2008).

The analysis of SMEs' innovativeness is particularly interesting because of the increasing importance and the contribution of SMEs to the global economy in promoting growth and employment opportunities (Bianchi et al., 2010; Chesbrough, 2010; OECD, 2000; European Union, 2003). There has been a widespread recognition that SMEs can achieve important advantages by "opening" their innovation strategies and investing in external network development (Freel 2000; Rogers 2004; Romijn and Albaladejo 2002).

In spite of the attention that small business literature has devoted to the link between networking and innovation, the issue of how SMEs should organize in order to limit the negative effects generated by networking and increase its benefits is still poorly investigated (Colombo et al., 2012) so that the debate appears to be relatively fluid. Earlier works on SMEs indicate that by nature, innovation in such firms has an external focus and is often strongly embedded in social and personal ties (Baum et al., 2000; Ceci and Iubatti, 2012; Edwards et al., 2005). Furthermore, external knowledge sourcing requires internal capabilities for managing innovation in order to integrate inflows of knowledge with internal innovation activities, successfully apply knowledge from internal and external sources, and direct innovation actions (Lichtenthaler, 2011; Robertson et al., 2012).

Take the empirical studies on OI, most of them have a prevalent focus on high-tech industries such as equipment, computers, ICT or pharmaceuticals (e.g. Christensen et al., 2005; Dittrich and Duysters, 2007; Fetterhoff and Voelkel, 2006), while empirical investigations on OI in SMEs operating in the agri-food industry are scarce in literature (Dries et al., 2014). However, several researchers (i.e., Enzing et al.,

2011; Archibugi et al., 1991) indicate that a more open system of innovation is necessary for sectors like this, which normally rely even more on external resources than other industries. Inside the agri-food industry, the wine industry can be considered an interesting case for this research field, because several highlights emerge that make it very different in comparison with other sectors (Nosi, 2009). These mutations, involving the demand and supply side, the structure of the sector and the role of the actors, are reflected in profound changes in the wine business environment as well as in wine business activities (Ndou et al., 2012).

The aim of this paper is to examine the organizational challenges to apply OI in Wine SMEs. More specifically, the focus is on how Wine SMEs organize themselves to implement and benefit from this approach. We developed our research questions: Which are the matters that influence Wine SME in opening/closing its approach to innovation? How does Wine SMEs use and develop organizational practices to sustain OI?

This research is explorative in nature. First, it deepens the concept of OI in the specific field of Wine SMEs. It follows the description of the results derived from a qualitative approach applied to a case study (the Italian winery Arianna Occhipinti). The last part is devoted to the discussion of the results and the conclusions with the theoretical and managerial implications.

THEORETICAL BACKGROUND

The Wine SMEs implementing open innovation

In recent years, the interest in the relationship between OI and the wine sector is receiving attention from several stakeholders. EU policy is particularly sustaining cooperation among SMEs, and creating a favorable climate for sharing knowledge and developing capabilities among the plethora of Wine SMEs and related sectors (Bareghehet et al., 2012; Martinez, 2014). The global scenario of the last years shows a profound change in the wine industry affecting the competitive dynamics (Giuliani, 2007), the supply-chain relationships (Vagnani and Volpe, 2009), the mode of relationship with the territory (Mattiacci, 2004; Iazzi and Fait, 2008) and the behavior of purchasing and consumption (Orth et al., 2005). These transformations are based on the demand and supply as well as on the structure of the industry and the role of the actors. From high-tech vineyards and winery management to sales and distribution, the entire industry has seen significant and positive changes that have led to higher efficiency and productivity in wine grape growing and wine production. As stated by Aylward (2003, p. 2) “one factor contributing to the seismic shift in the international production, export and consumption of wine is the innovative way in which a number of New World producers have embraced a range of R&D practices, including improved viticultural and oenological techniques and

management, high level training, knowledge transmission and technology transfer". Aylward (2003, p. 2) adds that "(...) in some New World industries, wine and wine grape production is becoming embedded within an environment of innovation", referring to the idea that the increased competitiveness is also due to the increasingly interactive relationship among wine stakeholders (suppliers, producers, industry organizations, R&D institutions and government agencies at local, regional and national levels) that allows for broader patterns of interaction for different levels and types of innovation across different economic 'spaces', regions and countries (Marceau et al., 2002). Dressler (2013) conducted a keyword search in the wine specific literature database "*vitis vea*", searching for scientific articles on innovation in the wine industry. He found three main research areas distributed as follows: 45% about oenology, 30% viticultural innovations, and the remaining 25% are on management. The latter involves three focal areas of innovation (cluster and network about 40%; product and marketing innovation about 30%; innovative organization and leadership about 12%). Stressing the results related to managerial aspects of innovation in the wine industry – product and marketing focused articles – the author highlights how the literature is product centric in the sense that it is mostly "oriented toward practitioners providing ideas or advice on how to realize specific product oriented wine innovations" (Dressler, 2013, p. 21).

Nosi (2014) conducted a review on all the papers presented at the International Conference of the Academy of Wine Business Research from the beginning (2003) up to 2014, with the main aim of making a state-of-art of the literature about wine management. Several interesting highlights emerged with reference to innovation. From Gilinsky et al. (2008), she highlighted the different places where innovations may take place and are: the vineyard (sustainable agriculture, organic or biodynamic, new varieties); the cellar (chips, sensory analysis, fermentation software), package (screw cap, silicon cork, glass top, other than glass and different sized bottles), operation (inventory software, recycling), and marketing (website, newsletter, wine club, wine events). Reading Durrieu's (2008) paper, she has confirmed how important are cooperative and intense interaction between wineries and other actors sited in the territory for supporting the spread of innovation. In this sense, "the launch of new products and services arises often from the interaction between the wine business and other activities carried out locally, such as tourism and events, as well as from collaborations between private organizations and public institutions in the same region" (Nosi, 2014, p. 8). Reviewing the recent literature, Dries, Pascucci, Török and Tóth (2014) have conceptualized the concept of OI in Wine SMEs as "the proportion of innovations generated in co-operation/collaboration with universities, research organizations, regional customers and/or suppliers, other agri-food companies, venture capitalists and industry/cluster associations or business assistance centers (open innovation) as opposed to innovations entirely generated within the company (closed innovation)" (p. 152-153). At the same time,

they also support the thesis that the issue of OI is “particularly controversial in the wine sector, where innovative marketing strategies have to be combined with sometimes ‘exclusive’ and ‘secret’ recipes, which make the quality of the products unique” (p. 3). The core business of small firms of sectors like this is most of the time related to production and marketing of traditional products usually connected with the local and family grounded recipes and procedures. Therefore, for many wine SMEs cooperation and OI create risks for appropriability of valuable resources for the companies even though cooperation and OI can be seen as an approach for overcoming organizational and financial limitations.

METHODOLOGY

This study has an exploratory nature, aiming at investigating the OI model in Wine SMEs. This field is relatively new and represents an under researched phenomenon. We actually know very little on how SMEs, operating in low-tech sectors, open up their organizational boundaries, how this approach contributes to foster innovation processes characterized by the integration of external knowledge sources. Few hands-on constructs or theories can help us to clarify and develop a conceptual framework in this area. As a result, qualitative research can be considered best suitable to tackle these aspects and provide an in-depth insight into OI in Wine SMEs. Specifically, we employ a case study approach, defined as “an empirical inquiry that investigates a contemporary phenomenon within its real-life context; when the boundaries between phenomenon and context are not clearly evident; and in which multiple sources of evidence are used” (Yin 1994, p. 13). Although case study method does not aim to generalize to populations (statistical generalization), such as other different methods (i.e., experiments), it aim to generalize to theories (analytical generalization; Yin, 2013). In line with grounded theory (Mills et al., 2006), a case study research and a literature review were used as a useful and necessary platform for theory development. Reflective reasoning (Miles and Huberman, 1994) has characterized the research process and has led to theory building. According to grounded theory, our explorative analysis started with a well-defined process moving from basic description stimulating conceptual ordering and then theory development.

Research context

In the last twenty years the international and national scenario of the wine industry has been characterized by the following various changes. First, European countries, which have traditionally dominated the world wine industry (i.e., France, Italy and Spain), have increasingly faced intense competitive pressure and a decrease in wine consumption, while other countries, defined as new players (i.e., United States, Australia, South Africa, Chile and Argentina) have experienced a significant growth both in production and consumption. Second, consumers’ preferences are changing

and evolving from traditional consumption forms to various experiential dimensions (Pine and Gilmore, 2000), and are more and more influenced by complex psychological and social factors. Finally, quality has become a central aspect for wine consumers and wine producers, more and more oriented to identifying and developing continuous quality improvements through product and process innovativeness. In fact, wine producers, mainly small businesses, have hardly the necessity to define or to modify their internal innovation process to successfully introduce and develop new products, characterized by high value added, to the market, becoming one of the most important strategies for food companies (Karantininis et al., 2010).

Looking at the specific Italian context, several highlights emerge. In 2014, the total production of wine has been around 40 million hectolitres, marking a - 17% compared to 2013. While domestic consumption continues to decline, overseas sales, despite the difficult period, grow. The data register a further increase in both value and volume, mainly due to the expansion of bottled wine (both Dop that PGI). This data confirm how the wine sector is crucial for the Italian economy, accounting for 30% of all its exports (www.inumeridelvino.it). As maintained by Chiodo (2010, p. 47), the Italian wine system is characterized by some traits that can represent both strengths and weaknesses:

- a high differentiation (mainly in terms of variety of product);
- a strong homogeneity in geographical level, both as regards the articulation of the production system and the performance of the various regions;
- a highly fragmented production structure so that there are businesses - and geographical areas - able to successfully compete in international markets and others that fail to adequately promote their product with appropriate marketing distributive strategies.

In this context, Sicily has over 160,000 (ha) and produces the highest quantity of wine in Italy, an average of about 8.5 million hectolitres per year, compared with 7 million hl of Veneto and 3.5 millions of Piedmont (the other most important Italian regions regarding wine) (www.inumeridelvino.it). It also claims wineries that are among the most modern in Europe and their wines receive the highest awards in different Italian and international competition. The autochthony varieties, such as Nero D'Avola, Frappato of Vittoria, Nerello Mascalese, Grillo, Zibibbo, are known all over the world and appreciated for their unmistakable characteristics. In addition, Sicilian wine producers show a continuous commitment towards the improvement of production quality to compete with the market challenges of the global market, investing in better quality vineyards (introducing new grape varieties, zonation, precision viticulture) and by introducing modern technologies in harvesting and better grape quality.

With this in mind, our single case study, involving a Wine SME that takes the name of his founder named Arianna Occhipinti, is drawn from a Sicilian context, where the wine business represents one

of the industries in which Sicily has retained a worldwide well-established reputation (Caniglia et al., 2008) thanks to the following variables: variety of grape wine cultivars, pedological climatic peculiarities, implementation of new techniques (i.e, pruning, fermentation, checks of winemaking, bottling, etc.) and production processes revisited. This case study is well suited to our research because this firm is well known for its orientation to experiment new products or to modify phases/methods of production, having the persuasion that is necessary “to acquire ideas and specialized knowledge to improve ‘the mental geo-locator’ that every wine producer must necessarily possess (by Arianna Occhipinti).

Data collection

The data were gathered using multiple sources of information (Yin, 2013) . Firstly, we performed field research through different rounds of in-depth interviews with entrepreneurs to explore specific aspects related to open innovation construct, such as the reasons for opening up its organizational boundaries, the difficulties linked principally to definition and development of processes of open innovation and, finally, the challenges related to open innovation approach and its possible influence on firm performance (i.e., generation of new products, customer satisfaction, sales growth). We carried out interviews with entrepreneur because in this he is a key informant and respondent for the reason that he has detailed information about firm’s decisions, operations and conditions (Deshpande and Farley, 2004). The interviews were conducted in March 2015, and each interview lasted approximately 2 hours, following the traditional methodological prescriptions on data collection through personal interviews (Lee, 1999). Secondly, we conducted desk research to identify and acquire data that already existed in documents, internal reports, dossiers, articles in order to obtain a good understanding of the firm’s innovation orientation and commitment. For validating our qualitative analysis, we presented the results to the original informants in order to obtain their feedback and corrections (Elliott, 1999).

RESULTS AND DISCUSSION

The entrepreneurial experience of Arianna Occhipinti begins in 2004 after studying oenology at the University in Milan and having travelled extensively in order to understand the geography redefined significantly by wine, to acquire new ideas and specialized knowledge globally distributed and to improve “the mental geo-locator” that every wine producer must possess. Titled the Natural Woman by the New York Times magazine (13 February 2013), Arianna Occhipinti started the wine activity with just a hectare of abandoned vineyard in her homeland, strongly underlining that “it is not necessary to start from something that has to be huge” (<http://www.rivistastudio.com/editoriali/politica-societa/arianna-occhipinti/>).

Her company owns nowadays 10 hectares of agricultural land that accommodate sapling vineyards and 15 hectares of olive trees in the rural area of Vittoria, a region on the South-Eastern side of Sicily characterized primarily by DOCG (controlled designation of guaranteed origin) for the great wine Cerasuolo di Vittoria. Although world wine is more competitive, vulnerable, and in perpetual transformation, Arianna Occhipinti has carried out different relevant investments, strongly believing that the labour of agricultural producer “is not a simple game (...). An agricultural firm must have a managerial size, but economically convenient that puts it in a condition to produce better wine” (<http://www.ilfattoquotidiano.it/2012/08/17/arianna-occhipinti/327606/>). As highlighted in tab. 1, the Arianna Occhipinti firm counts from 6 to 10 employees, operates in BtoB and BtoC markets and exports over 70% of production.

Main characteristics	
Year of foundation	2004
Area of production	Vittoria – South-Eastern side of Sicily
Vineyard area (ha)	10
Oil area (ha)	15
Number of Wines/bottles	120.000/130.000
Employees	from 6 to 10
Turnover (000€) – 2013	>300 ≤ 500
Principal Wine types	Albanello and Moscato d’Alessandria Frappato and Nero D’Avola Frappato of Vittoria Nero D’Avola Frappato of Vittoria and Nero D’Avola Nero D’Avola (late harvest)
Oils	Nocellara of Belice Tonda Iblea

Table 1 – Main characteristics of Arianna Occhipinti case study.

With her innate talent and aim to go against the trend of the other regional wine producers and to initiate relevant processes of innovation concerning the different phases of wine production, Arianna Occhipinti has decided to develop an organic agriculture. It is focused on the rediscovery and exploitation of traditional local methods of wine production and differs primarily from modern techniques used in the viticulture context and more influenced by the current processes of industrialization. For example, organic agriculture, carried out by this entrepreneur, shows some distinctive factors, such as the absence of fertilization, tillage activities at the beginning of the summer season, the prediction of two sulphur treatments, the revitalized phases of fermentation, long maceration, and, finally, the lack of proper filtration. Certainly, these experiments underline the relevant role, the singular competences and principally the ethic of Arianna Occhipinti that demonstrates a strong orientation to the continuous improvement in terms of products and process innovation, exceeding the stereotypical view of agriculture in the South that is still unable to define and activate significant pathways of evolution. In fact, her personal characteristics and her enthusiastic

temperament are directly linked to the inimitable desire to experiment and/or improve new products, to focus essentially on customer needs and preferences, and to find new useful ways to promote and commercialize her innovative outputs. Despite the presence of a dynamic and innovative entrepreneurial profile and a certain degree of openness, the interview has highlighted the fact that innovation processes are mainly internal and the approach of Open Innovation has still not a pervasive penetration into the strategies of the SME here investigated.

Our analysis allows the underlining of several aspects concerning how this small enterprise considers the Open Innovation concept. Firstly, it is opportune to point out that the concept of OI has little place in this firm. It happens also if Arianna Occhipinti recognizes that the increasing changes of competitive arena necessarily require organizational adaptations and, in this perspective, the opening up of the firm's boundaries could be a suitable solution for accelerating the internal innovation processes, acquiring complementary resources, reducing costs of development and, consequently, benefiting from innovative efforts. A certain "contamination" with different external knowledge sources is limited to the scouting/acquisition of new input and new ideas, necessary to develop products that meet the customer's needs and/or to modify phases of production in order to improve the levels of quality and productivity.

Other firms (small or large) that operate in Sicily or, more often, other firms that operate outside the region are able to generate their own ideas and furthermore they have extended internal R&D capabilities and competencies, useful to discover and develop new products or new technologies. Experts of oenology can provide interesting information about the effects of variables (i.e., climate) on viticulture and wine. Consumers can understand their shifts of preferences away from basic commodity wine to top quality wine.

For Arianna Occhipinti, external "contamination" is more and more an obligatory way because exchange and comparison with other firms/experts enables the exploration, evolvment and advancement in its competencies and capabilities, and, sometimes, experiment ideas existing and not developed. In this direction, interesting are the collaborative innovation forms, activated recently with local wine enterprises and oriented towards the identification of useful industry standards, exploring new techniques, carrying out suitable opportunities of reciprocal learning. However, the results of these collaborations are still poor, principally, because of the differences - cognitive, organizational and cultural - among involved partners that still persist. This implies that potential barriers to open innovation processes "may arise due to insufficient knowledge, cultures or modes of organization, or bureaucratic elements" (van de Vrande et al., 2009, p. 427).

In spite of these problems, the entrepreneur prefers the mentioned stakeholders rather than the formal/informal collaboration with universities or research bodies, highlighting the relevant problem of not-invented-here (NIH) syndrome (Katz and Allen, 1982). Also, the lack of internal commitment that perceives the increasing power of the OI team as a threat to their survival and fear of the risk of dangerous spillovers in the project's results (Mayer, 2006). Certainly, these aspects represent other challenging barriers (i.e., Chesbrough and Crowther, 2006; van de Vrande et al., 2009) that discourage the adoption of OI practices and, more specifically, the possibility to activate forms of collaborations with these organizations oriented towards acquiring new knowledge and developing innovative outcomes.

Concerning other barriers to implement OI practices, it is interesting to highlight the thought of this entrepreneur. She affirmed that the activities and projects related to the implementation of OI strategies are often abandoned because, in general, small firms have to face several problems linked mainly to lack of knowledge (i.e., technological), resources (i.e., costs of innovation, time needed, human capital), competencies (i.e., specialized knowledge, expertise, not enough labour flexibility), motivation and commitment (i.e., strong resistance of employees to change), substantial investments (i.e., difficulties to obtain financial resources) and services (i.e., support to systematically explore internal and external creativity). In addition, the open innovation projects require an efficient coordination activity of internal resources and external network partners to foster and support innovation processes, to gain access to their knowledge and to achieve their synergies and energies, to address or take advantage of different market opportunities. Unfortunately, this coordination activity is poorly developed in the SMEs that often show little experience in terms of management of a large resource pool to define and implement complex innovation processes.

CONCLUSIONS AND IMPLICATIONS

Studies focused on OI in SMEs operating in low-tech sectors are a relatively young and emerging research field. This is particularly true in the wine sector.

This work offers a contribution to deepen the knowledge in this field and represents a first step in understanding the factors that urge Wine SMEs to move towards an OI approach and a new scientific contribution based on the analysis of the Italian context.

The findings suggest that OI is enjoying an increasing interest although the case has shown that we cannot yet speak of a veritable declared strategy. It appears more like a set of fragmented initiatives and, moreover, at a beginning stage with several barriers that hinder a significant improvement. About this last point, this study has revealed a coincidence between previous researches and findings so that the entrepreneur has confirmed that there are several barriers. Among them, it seems

opportune to highlight the one related to the differences - cognitive, organizational and cultural - among involved partners in addition to the fact that the entrepreneur also stated that the best examples to which she refers often come from companies of other regions. This fact deserves a proper deepness if we consider that Sicily is among the most important Italian regions in the wine sector in that it is possible to argue that it has a large stock of wine knowledge and culture. Looking at the different external knowledge sources the case has revealed that the process of OI is limited to the scouting/acquisition of new input and new ideas, necessary to develop products that meet the customer's needs and/or to modify phases of production in order to improve the levels of quality and productivity. In other words, the presence of a certain unwillingness to open the doors of the cellar appears. This seems to confirm the thesis of Dries et al. (2014) who maintain that the implementation of OI in the wine sector is particularly controversial looking for examples to the marketing where strategies have to be joined with the 'exclusiveness and secrecy of the recipes, which make the quality of the products unique.

Findings also revealed a certain low level of the number of sources of knowledge so that the stakeholders listed by the interviewed are limited to other firms, experts and customers while the list might be certainly longer. In particular, the entrepreneur stated that there are no collaborations with Universities and research centres. The not-invented-here (NIH) syndrome (Katz and Allen, 1982) can represent a relevant problem and it deserves a deeper analysis to better understand the impediments that obstacle the collaboration.

From a theoretical point of view, our study contributes to innovation literature because it examines the concept of OI in the SMEs, operating in the Wine traditional sector, supporting the idea that a necessary emphasis on this approach within these entrepreneurial contexts would foster and accelerate their innovation processes. From a managerial point of view, our results highlight that managers have to define efficiently pathways and actions to opening up their organizational boundaries to acquire knowledge, competencies and capabilities from external environments, selecting useful collaboration forms with other entities to share information and costs and also trying to overcome barriers that hinder the implementation of the OI model in SMEs.

Despite the significance of the results, there are some limitations that pose further examinations to be addressed. First, our empirical analysis is on qualitative approach (in particular, single case study) and, consequently, our findings are not generalizable to the Wine SME population. Therefore, further research appears opportune to define and apply quantitative research methods, involving a larger sample and elaborating a specific sampling scale for demonstrating the relevance of OI in the SME context. In addition, our study highlights that several barriers (i.e., culture, commitment, resources, etc.) play a crucial role in the openness of SMEs operating in low-tech sectors, however, further

research may investigate these aspects in a fine-grained manner and also the strategies could be defined by SMEs that permit these conditions/barriers to be overcome efficiently.

ABSTRACT

The aim of the present study is to develop an e- tailing mix model and research work tests their relationship with consumer motives. On the basis of review of published literature on e-commerce, e-marketing and e-tailing, a conceptual framework for the present research has been developed. The elements for e-tailing mix were explored and confirmed. A set of hypotheses concerning direct link among constructs are developed for their impact on consumer motives.

The research methodology employs a self administrated questionnaire survey of customers that generated 413 valid responses. The questionnaire was designed with 40 basic constructs containing customers' online shopping concerns out of review of literature, executive opinion and focus group and motives (3 constructs). The questionnaire has measures for each of the constructs, and respondents' characteristics as well. Measurement scales for the constructs satisfied the minimum requirements of Cronbach's alpha coefficient. The measurement models of the Structural Equation Modeling's constructs were evaluated using confirmatory factor analysis (CFA). They were accepted on the basis of measures of fit, the statistical significance and the signs of the coefficients. The research concludes with the estimates of relationship between consumer motives and the elements of e- tailing mix. The findings of this work may help the online retailers in strategizing themselves in a better manner.

Keywords: *e- tailing, e- tailing mix, consumer motives, SEM, EFA and CFA*

INTRODUCTION

Based on Avendus estimates, the Indian e-tailing market will grow to Rs 53,000 Crore (\$9.64 billion) in 2015 and whereas as per BCG estimates, the overall retail market in India is estimated to grow to Rs 36 lakh Crore (US\$ 65.45 billion) by 2015. With an online penetration of 1.4% in 2015, the e-tailing market will be Rs 50,900 Crore (\$9.15 billion). Many researchers worldwide have tried to find out the

marketing mix for e-retailing because when the dot com companies busted in late 2000 it has been attributed that the marketing mix for the e-retail business was not properly defined and most of the companies have adopted the same old age marketing mix as suggested by McCarthy with little changes. Prominent among them were Dave Chafey, Allen & Fjemstad and Kirti Kalyanam, they all have suggested their frame works for e-marketing. The model proposed by Kirti Kalyanam, 2002 talked about 4P + 2P+2C+2S. Where 4Ps are Product, Price, Place and Promotion and additions P, C & S are being describes here. 2P – Personalization and Privacy, 2C – Customer Services and Community & 2S - Site Security and Sales Promotion. This model as proposed by Kalyanam may be opposed in India as Indian consumers are very sensitive towards the safety issues of their payment and products purchased electronically.

On the other hand, the consumer motives are internal impulses when stimulated, initiate some types of responses (Duncan, 2005). Consumer motives are known to be the drivers of behaviors that bring consumer to the purchase location (in the present study to e locations) (Kim& Jin, 2001).

The present research aims at studying the popular e-retailing website in Indian context to understand the elements of e-tailing mix and their relationship with consumer motives using structural equation modeling with the help of Analysis of Moment Software (AMOS 20.0).

REVIEW OF LITERATURE

The conventional retail channels would be completely wiped out when manufacturers would contact the consumers directly over the Internet and eradicate the need for redundant physical retailers or other intermediaries completely. (Laudon & Traver 2004) The real foundation for e- tailing can be described with the foundation building during 2000's, when the internet penetration increased steadily, the advancements on technology provided better interfaces to customers.

The most cited definition is the one provided by Turban et al. (2006) '*Retailing conducted online, over the internet.*' Many other researchers have explained that the concept of e- tailing is similar to B2C. Prominent among them are Doolin (2004); Rao (1999); Turban et al. (2004); White (2001), Wang (2002) who have proposed the definition of e-tailing as "the selling of goods and services to the consumer market via the internet. e-tailing revenue can come from the sale of products and services, through subscriptions to website content, or through advertising" whereas dictionary.com defined e-tailing as, "the selling of goods and services on the Internet or through e-mail solicitation."

In the report, 'India Goes Digital' AVENDUS has projected that the Indian market will also evolve towards higher contribution from e-tailing in coming years. As per their estimates, e-tailing will catch up with online travel by 2015 with each of them contributing approximately \$12 billion to the total ecommerce market in that year.

Potential factors that constitute the elements of e-tailing mix

A methodical review of the published literature has been carried out using key words like e-commerce, e-marketing, e-marketing mix, e-retail, e-retailing, e-tailing, B2C, B2B, C2C and marketing mix to find out what other researchers have contributed as regards to the marketing mix of e-space. Based on the review of literature it was found that Paucity (Lack/shortage) of Time, Privacy, Security concerns of the consignments, Social Networking website and co-ordinates, Navigation, Regulatory & Legislative Uncertainty (While purchasing from different country's website), Customer Service, Selection Freedom of products, Familiarity of websites, Response to Customer Needs, Ease of Vendor Contact, Attractive Display of products, Ease of Return, Ease of Refund, Transaction Cost, Shipping Cost, On time Delivery, Prompt reply to the queries as regards to purchase, Reliability (Impartiality) as regards to products delivered, Useful Information Contents, Eye Catching Homepage Design, Exchange of Products, Personalization, Discounts, Offers, Website Colors, Comparison of Products, Testing of products, Trouble Shooting, FAQs, Value Added Info On website, Processing Time efficiency while making payments, Processing Time efficiency while making payments, Affordability, Mode of Payment, Online Community on the website, Trust of website, Promotion of the website, Branding of the website, Accuracy of Contents, Language Options, Security of Payments, Human Assistance in the form of Online Chat and Call back Services and Customization of Product may constitute the potential factors for e-tailing.

Consumer motives are internal impulses when stimulated initiate some types of response. (Duncan 2005). Consumer motives are known to be the drivers of behaviors that bring consumer to the purchase location (in the present study to e-locations) (Kim & Jin, 2001). Motives are the drives, impulses, wishes or desires that initiate the sequence of activities known as behavior. Behind any purchasing action, there are several factors, which are playing an influential role where that makes the customer to perform the task. Pride and Ferrel, (2010) have referred motives as an internal energizing force that directs persons' activities towards satisfying needs or achieving goals. Buyers' actions are affected by a set of motives rather than by just one motive. Motives also affect the direction and intensity of behaviour. Motives can be explained as drives, impulses, wishes or desires that initiate the sequence of activities known as behaviour, Udell, (2001). Copeland (1925) proposed separating them into two categories, rational and emotional: These motives have their origin in human instincts and emotions and represent impulse or unreasoning promptings to action.

Based on previous studies, patronage buying motives into retail stores, malls, and other shopping centers are very diverse, including: personal motive, motive to socialize, seek experience motive, motivation for product, price, extrinsic and intrinsic motives, interior design, joy, and look for variations, utilitarian motives, hedonic motives, and others Groeppel-Klein, Thelen (1999), Jin and

Kim (2003); Moschis, Curasi, et al . (2004). For example, studies on shopping center patronage buying motives done e.g. by Bodkin and God, 1997; Ruiz, 1999; Dennis et al, 2001, Nicholls,et al, 2000. An article by Prashanth Reddy “Do you recognize the 31 important types of buying motives of customers?” categorized all of them in three basic consumer motives namely, rational, emotional and patronizing motives, which the research has taken a base for this study.

Identified Research Gaps

The review of the reported literature explores the possibilities of un-touched issues related to the research domain. The followings are the issues that need immediate attention so that the body of knowledge related with e-tailing and consumer motives get enriched.

- ❖ The review of the published literature might not find any structured model of e-tailing mix, so to facilitate marketing professionals it needs to be modeled.
- ❖ Attention is needed to ascertain relationship among the elements of e- tailing mix and consumer motives that is an area of great potential and is unexplored in Indian context.

Based on above mentioned research gaps following research question emerges which needs attention to get addressed by the researcher. Can some potential elements for e- tailing mix be explored in order to model them as e- tailing mix and then further understand their relationship with consumer motives?

CONCEPTUAL MODEL OF THE PRESENT RESEARCH

An effort is being made in the current research to model the marketing mix for e - tailing and to establish the relationship between elements of the e - tailing mix with consumer motives through the following conceptual model. (Dotted boxes are shown because of unsure nature/type of elements which will be explored later.

Figure 1. : Proposed Conceptual Model

It is also proposed to test their relationship for significance, among the elements of e - tailing mix and consumer motives. And for the same following hypothesis are developed.

- | | | |
|-----|-----------|--|
| H1: | Element 1 | has a direct and positive impact on consumer motive. |
| H2: | Element 2 | has a direct and positive impact on consumer motive. |
| H3: | Element 3 | has a direct and positive impact on consumer motive. |

| H5: | Element 5 | has a direct and positive impact on consumer motive. |
| H6: | Element 6 | has a direct and positive impact on consumer motive. |

RESEARCH DESIGN

Bickman et al., (1997) while describing the research designs states that it serves as the “architectural blueprint” for any research, as it involves the research approach to be used, and the best methods of collecting and analyzing the data. Research designs link data collection and analysis activities to the research questions and ensure that all research aspects will be addressed (Bickman et al., 1997). Burns and Grove (2003) opine research design as a blueprint for conducting a study with maximum control over the factors that may interface with the validity of the results. Parahoo (1997) describes a research design as a plan that describes how, when and where data are to be collected and analyzed. Polit et al. (2001) define a research design as the researcher’s overall efforts for answering the research question or testing the research hypotheses. Punch (1998) suggests that the concerns of research design are to answer the following questions:

- ✚ Who or what will be studied?
- ✚ What strategies of inquiry will be used?
- ✚ What methods will be used for collecting and analyzing empirical materials?

<p>Who and What will be Studied?</p>	<ul style="list-style-type: none"> • The Present research aims at studying the elements of e- tailing mix and their relationship with consumer motives. • The Pre identified respondents on the basis of sampling frame at Mumbai and Pune will participate in the study.
<p>What strategies of inquiry will be used?</p>	<ul style="list-style-type: none"> • Focus Group Discussion • Pilot Study • Structured Interviews with the help of pre designed and tested Questionnaire
<p>What method will be used for analyzing collected Data</p>	<ul style="list-style-type: none"> • EXPLORATORY FACTOR ANALYSIS • CONFIRMATORY FACTOR ANALYSIS • STRUCTURAL EQUATION MODELING

Target population and sample

A population is the total group of subjects that meet designated set of criteria. Polit and Hunler (1999) distinguish between the target population and the accessible population. The target population includes all the cases about which the researcher would like to make generalization. The ten most populated cities of India ; Mumbai, Pune, Hyderabad, New Delhi, Kolkata, Jaipur, Surat, Ahemdabad, Chennai and Bangalore as per CENSUS study 2011, have been chosen as the population for the present research as the most of e tailing business are centered around these cities. The target population comprises of all those people of the mentioned cities who have made the purchases electronically. In sampling for a survey a researcher should answer three questions; Margin of error, Confidence level and the population, in the present study they were 5%, 95% and more than 20,000 respectively, so after computation the recommended sample size for the present study was 377 spread equally over these ten cities.

The first phase of the study (Focus Group Discussion) was conducted at a town place of Pune, Lonavala for three groups, and each group having 8 respondents in a group along with the researcher as the moderator. In the second phase the researcher has made contacts with 619 persons matching the above criteria and could collect responses from 413. Since in the present research Structural Equation Modeling is applied, According to James Stevens' 'Applied Multivariate Statistics for the Social Sciences a good rule of thumb is 15 cases per predictor in a standard ordinary least squares multiple

regression analysis. Since SEM is closely related to multiple regression in some respects, 15 cases per measured variable in SEM is not unreasonable. Bentler and Chou (1987) note that researchers may go as low as five cases per parameter estimate in SEM analyses, but only if the data are perfectly well-behaved (i.e., normally distributed, no missing data or outlying cases, etc.). Likert scale is used to measure all items relating to e- tailing mix elements, motives and relationship, because Likert (Sekaran, 1992) scales are very suitable for measuring a wide variety of latent constructs. A scale of 7- Strongly Agree 6- Agree 5- Somewhat Agree 4- Neither agree nor Disagree 3- Somewhat disagree 2- Disagree 1- Strongly Disagree is employed for the measurement in the present study.

DATA ANALYSIS

Scale Reliability

It is mandatory to check the reliability of the scale because this scale has not been previously explored by any researcher in context of Indian industries and internal consistency or reliability is particularly important in connection with multiple item scales. Cronbach's alpha has been used to check the internal consistency. Ideally, the Cronbach's alpha scale for internal consistency (Nunnally 1978) should be above 0.7 (Pallant, 2005). Items that rate below the recommended alpha level of 0.7 may be removed in order to improve the scale's reliability. In the present research, the value of Cronbach's alpha computed using SPSS 20.0 software for the 43 items was found as 0.968, which is reasonably on a higher side to be accepted. According to Sekaran (1992) higher the value of Cronbach's alpha (closer to one), the higher is the internal consistency or reliability.

Exploratory Factor Analysis

Exploratory Factor Analysis (EFA) can be described as orderly simplification of interrelated measures. EFA, traditionally, has been used to explore the possible underlying factor structure of a set of observed variables without imposing a preconceived structure on the outcome (Child, 1990). By performing EFA, the underlying factor structure is identified. It is a statistical method used to determine a small set of unobserved variables (also called latent variables or factors) that can account for the covariance among a larger set of observed variables (also called manifest variables). A factor is an unobservable variable that is assumed to influence observed variables (Albright et al., 2009). Factor Analysis is the most suitable tool to determine the set of variables that forms a coherent subgroup which are relatively independent of one another.

Assessment of the Suitability of the data for Exploratory Factor Analysis

There are two main issues to consider in determining whether a particular data set is suitable for factor analysis: sample size, and the strength of the relationship among the variables (or items). While there is little agreement among authors concerning how large a sample should be, the

recommendation generally is: the larger, the better. In small samples the correlation coefficients among the variables are less reliable, tending to vary from sample to sample. Factors obtained from small data sets do not generalize as well as those derived from larger samples. Two statistical measures are also generated by SPSS to help assess the factorability of the data: Bartlett's test of sphericity (Bartlett, 1954), and the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy (Kaiser, 1970, 1974). The Bartlett's test of sphericity should be significant ($p < .05$) for the factor analysis to be considered appropriate. The KMO index ranges from 0 to 1, with .6 suggested as the minimum value for a good Factor Analysis (Tabachnick & Fidell, 2001). The value of KMO Statistics (.945) is larger than 0.5), thus the factor analysis may be considered appropriate technique for data reduction.

Factor Extraction, Rotation and Interpretation

Factor extraction involves determining the smallest number of factors that can be used to best represent the interrelations among the set of variables. In practice, the two approaches (orthogonal and oblique), of rotation, often result in very similar solutions, particularly when the pattern of correlations among the items is clear (Tabachnick & Fidell, 2001). Within the two broad categories of rotational approaches there are a number of different rotational techniques provided by SPSS (Orthogonal: Varimax, Quartimax, Equamax; Oblique: Direct Oblimin, Promax). The most commonly used orthogonal approach is the Varimax method, which attempts to minimise the number of variables that have high loadings on each factor. The method of Varimax rotation is used in this study.

Results And Interpretations (Exploratory Factor Analysis)

Total variance explained by the extracted factors is being presented in table 5.14. The Total variance explained was 73.571% which is a very good estimate. It is recommended that the factors extracted should account for at least 60% of the variance (Malthotra and Dass, 2007).

Table 1: TOTAL VARIANCE EXPLAINED

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings

EXTRACTION METHOD: PRINCIPAL COMPONENT ANALYSIS.

Table presents the rotated component matrix using Principal Component Analysis as extraction method and Varimax with Kaiser Normalization as rotation method. The rotation converged in 8 iterations. Seven factors are found after Varimax rotation. The type / category of the items loading to any individual factor need to be understood to explain and define the particular extracted factors. The clustering of the items in each factor and their wording offer the best clue as to the meaning of that factor and also help to allocate a justified name to that factor.

Extraction Method: Principal Component Analysis.							
Rotation Method: Varimax with Kaiser Normalization.							
a. Rotation converged in 8 iterations.							

The above mentioned rotated component matrix shows that all the variables used in the analysis are loaded upon seven factors. **They are labeled as following;**

Factor 1: Pool of Variables Q9- Q16 (**SITE DESIGN**) {SD}, Factor 2: Pool of variables Q1 – Q7 (**SAFETY**) {SF}, Factor 3: Pool of variables Q27 – Q32 (**SALES TALK**) {ST}, Factor 4: Pool of variables Q20-23and Q25/26 (**SERVICE**) {SR}, Factor 5: Pool of Variables Q36-40 (**SALMAGUNDI (Product**

Related)) {SD}, Factor 6: Pool of variables Q34 – Q35 (**PRICE RELATED**) {SUM} and Factor 7: Pool of Variables mv1-mv3 (**MOTIVATION**) {MV}

Salmagundi, here, is being assigned to the product related factors as it stands for assortment of elements of SALAD in a plate, which is treated as synonymous here for this research as website and its arrangement and display of products on it. The above connotations have been used in the hypothesis formulation and in Confirmatory Factor Analysis and Structural Equation Modeling.

Structural Equation Modeling

This section presents the attempt made by the researcher to develop a model using extracted factors discussed in the earlier section through Exploratory Factor Analysis. The Structural Equation Modeling is used develop a precise model to help further analyses. SEM is preferred over other statistical techniques because it allows the modeling of relationships among several independent and dependent variables simultaneously (Gerbing and Anderson, 1988). Thus, SEM has been chosen to test causal relationship and subsequently model development. Structure Equation Modeling has two primary component; The Measurement Model: It describes the relationships between observed variables and the constructs or latent variables which are to be measured. The Confirmatory Factor Analysis (CFA) is used to test the measurement model. Such models specify hypotheses about the relations between a set of observed variables, such as ratings or questionnaire items, and the unobserved variables or constructs they were designed to measure (Robert Ho, 2006) and The Structural model: It describes the interrelationships among constructs and is a flexible, comprehensive model that specifies the pattern of relationships among endogenous and exogenous variables. It shows the strengths of multiple regression analysis, Factor Analysis, and multivariate ANOVA in a single model that can be evaluated statistically. It also permits directional predictions among a set of independent or dependent variables, and provide modeling of indirect effects. The structural model is of greater interest since it offers a direct test of the theory of interest (Robert Ho, 2006).

Construction of Measurement Model

The 37 measured variables (EFA) were drawn using rectangle, while 7 latent constructs were made using ellipse and all the error terms using circle. The single headed arrows indicate linear dependencies, these arrow-head points toward observed variables from their respective dependent variable or latent construct. The path coefficient of all the error terms from e1 to e37 were fixed to unity, while the path coefficients for one of the observed variables for each construct were also fixed to unity as this is necessary condition for model to be identified.

Figure 2. Measurement Model

Results and Discussion for Measurement Model

Assessment of Reliability

Reliability can reflect the internal consistency of the indicators measuring a given factor. Scales were statistically measured for indicator reliability and scale reliability. The indicator reliability should preferably be 0.5 or greater (Long, 1983; Schumacker and Lomax, 2004). Even values close to the recommended are considered acceptable (Wu, 2005). A value of Cronbach's alpha of 0.6 or more is used as a criterion for a reliable scale (Hair et al., 1998; Nunnally and Bernstein, 1994). The Cronbach alpha, CR and AVE values are given in table below;

Table 3. Scale Reliability Items

Sr. No.	Scale	Cronbach's alpha	Construct Reliability	Average Variance Extracted	No. of Items
1	Safety	.940	.858	.553	7
2	Site Design	.953	.917	.734	10
3	Service	.911	.76	.515	9
4	Sales Talk	.958	.92	.742	6
5	Sum	.805	.778	.636	3
6	Salmagundi	.871	.7922	.56	5
7	Motives	.880	.6514	.48 = .5(Approx)	3

Assessment of Validity

A scale is valid if it measures the concept that it was intended to measure (Bagozzi, 1981; Malhotra, 2010). Since unidimensionality and reliability have been established, the next step is to assess validity. Various measures of construct validity named as Convergent (Bentler-Bonett Coefficient), Discriminant (through Average Variance Extracted) and Criterion Validity were computed. While Convergent and Discriminant Validity are measured using the Measurement Model; the Criterion Validity is measured through the Structural Model. The convergent validity can be measured using the Bentler-Bonett Coefficient (Bentler-Bonett, 1980) in AMOS20. Ahire et al. (1996), Green et al. (2006) recommended assessing convergent validity using the Bentler-Bonett coefficient with values greater than 0.9 indicating strong convergent validity, even the NFI and NNFI of .8 and above are considered

a good fit. In the present case all the scales have a Bentler-Bonett coefficient (i.e. NFI and NNFI) of greater than 0.8 as given in following table, thus indicative of high convergent validity.

Table 4. Indicator of Convergent Validity

Sr. No.	Scale	NFI	NNFI
1	Safety	.944	.923
2	Site Design	.877	.851
3	Service	.978	.975
4	Sales Talk	.929	.889
5	Sum	.979	.985
6	Salmagundi	.935	.879
7	Motives	.992	.998

The measurement model has been constructed using 37 items and 7 constructs. The AMOS results obtained are as follows;

Table 5. Computations of degrees of freedom (mm)

Number of distinct sample moments:	703
Number of distinct parameters to be estimated:	95
Degrees of freedom (703 - 95):	608

D. Chi-square, = 2327.527 at Probability level, $p = .000$.

Discussions: The input covariance matrix generated from the model's 37 measurement variables contains (Table 5.18) 703 sample moments (Table 5.20). For the Measurement Model, there are 37 regression weights, 21 covariance, and 44 variances, thus a total of 102 parameters to be estimated. The model has 608 degrees of freedom (703 – 95) since, the number of parameters to be estimated (102) are less than the degree of freedom (608), this implies that the model is over identified which is the necessary condition before CFA.

Measurement Model Improvement

AMOS suggests two ways of improving the measurement model which can be helpful in detecting the model misfit. They are either with the help of modification indices and the standardized residuals (Barbara M. Byrne, 2010). On the basis of these two the model was improved. Fifteen measurement variables were dropped that did not confirm the standards. .

The Final Fit Model

The initial model was modified and out of initial 37 measurement variables, the modified model has 22 measurement variables, five correlations have also got reported in the modified model. It took 16 iterations to converge to the final measurement model. The chi-square goodness-of-fit value for this modified model (528.725) was found significantly smaller than the chi-square value obtained for the initial model (2327.5). With insignificant chi-square value, the final measurement model, therefore, represents best possible fit to the data in context of the present research.

Figure 3. Final Fit Model

TABLE 6. Computations Of Degrees of Freedom (FIT MODEL)

Number of distinct sample moments:	276
Number of distinct parameters to be estimated:	72
Degrees of freedom (276 - 72):	204

D. Minimum was achieved; Chi-square = 528.725 at Probability level = .000

sf1	<---	SF	.900	.054	16.573	***

Above Table, shows the un-standardized path coefficient estimates, the Standard Error (S.E.) and Critical Ratio (C.R.). The recommended C.R. value in the test statistics is $> \pm 1.96$. As can be seen, all estimates found to have critical ratio values > 1.96 , thereby indicating their statistical significance

which is represented by *** (means probability < 0.000). It shows the statistically significant paths and their respective coefficient of the variables, thus proving measurement model to be precise and able to measure the correct output.

Predictive Validity

Ahire et al. (1996) and Garver and Mentzer (1999) recommended assessing predictive validity by determining whether the scale of interest correlate as expected. SEM was used to ascertain the correlation and determine predictive validity. All correlation values were found to be positive and significant thus giving proof of predictive validity.

Model Fit Summary

The standardized path coefficients of the Structural Model were estimated by AMOS20. It was found that the structural model fits the data well. The fit indices values are given in table below, The global fit statistics indicate the structural model represent the data structure well. The significant value ($p=0.000$), Bollen-Stine statistic indicated a model fit and so suggested the model could be accepted i.e. $p<0.05$. The RMSEA value (.052) falls well below the maximum recommended value of 0.08 or 0.10 and values for NFI (.936), NNFI (.963) and CFI (.970) all exceeded the recommended 0.90 level, indicating a good fit. The relative chi square/ degree of freedom of 1.792 were less than the recommended maximum of 3.00 Hair et.al (2012).

TABLE 8. CMIN/DF IN FIT MODEL

So finally the model which got fitted has following factors; Factor No. 1 **SAFETY** comprising of Privacy while purchasing, Mode of Payment, Trust of Website, Security of Payments and Processing

Time while making the payment. Factor No. 2 **SITE DESIGN** comprising of Useful and Precautionary information on the website, Ease of Online ordering, Eye Catching Home Page Design and Personalization. Factor No. 3 **SUM** comprising of Shipping Cost and Discounts. Factor No. 4 **SERVICE** comprising of Ease of Vendor Contact, Ease of Return and Exchange, Ease of Refund and Minor(Peripheral) Contact with Seller. Factor No. 5 **SALMAGUNDI** comprising of Brands Available, Accuracy of Contents on the website and Availability of Selected Product. Factor No. 6 **SALES TALK** comprising of Online Demo, Online Community on the Website, Unique Offers and Social Networking Websites and Their Co-ordinates.

Hypothesis Testing: For hypothesis testing through the path analysis in SEM, following model is developed with the help of elements confirmed in CFA.

Figure 4. Structural Equation Model for Hypothesis Testing

The path coefficients of the structural model indicate the magnitude and direction of relationships and thus are used for testing the hypotheses are given in the above diagram.

H1: Safety ----- is a direct and positive impact on consumer motive.

Safety has a direct, significant and positive impact consumer motives as indicated by the significant path from SF to MV ($\beta=0.63$). Thus hypothesis H1 is **accepted**.

H2: Sales Talk ----- as a direct and positive impact on consumer motive.

Sales Talk has a direct, significant and positive impact consumer motives as indicated by the significant path from ST to MV ($\beta=.12$). Thus hypothesis H2 is **accepted**.

H3: Sum ----- has a direct and positive impact on consumer motive.

Sum has a direct, significant and positive impact consumer motives as indicated by the significant path from SUM to MV ($\beta=.21$). Thus hypothesis H3 is **accepted**.

H4: Salmagundi ----- has a direct and positive impact on consumer motive.

Salmagundi does not has a direct, significant and positive impact consumer motives as indicated by the non significant path from SMD to MV ($\beta=-.43$). Thus hypothesis H4 is **rejected**.

H5: Site Design  **has a direct and positive impact on consumer motive.**

Site Design has a direct, significant and positive impact consumer motives as indicated by the significant path from SD to MV ($\beta=.44$). Thus hypothesis H5 is **accepted**

H6: Services  **has a direct and positive impact on consumer motive.**

Service has a direct, significant and positive impact consumer motives as indicated by the significant path from SR to MV ($\beta=.20$). Thus hypothesis H6 is **accepted**.

CONCLUSION

This research work has developed an e- tailing mix model integrating selected elements of e-commerce and e- marketing for Indian e- tailing companies using a data analysis tool i.e. SEM which has recently come in use in the area of marketing management and also it do not contain complex mathematical equations and has the best feature to represent the relationship graphically. Thus, a model which is easy to interpret and able to guide the marketing practitioners in real practice is developed. Though, some elements are practiced in the marketing of e- tailing but the fact is that the marketing practitioners are not able to categories them as per their significant suitability. In Indian context of e- tailing the elements safety, site design, sum, service, sales talk and salmagundi play a vital role. In order to be successful in this domain of e- tailing, the companies should mix these elements properly to yield good results.

Testing the Relationship among e- tailing Mix Elements and Consumer Motives

The other prime objective of the present research was to ascertain the relationship among the elements of e- tailing mix and consumer motives for which the results are mentioned below;

The following e-tailing mix elements have direct, significant and positive relation with consumer motives;

- **Safety, Site Design, Service, Sales Talk, and Sum**

Whereas

- **Salmagundi (The Product Related issues)** does not has a direct, significant and positive relation with consumer motive.

It is therefore concluded that consumers will be motivated to purchase on those websites only which will have good safety features, with very attractive site design, high, loud and noticeable sales talk, good pricing mechanism and of course that can provide very effective customer services. On the other side, Salmagundi (the product related issues) will not come in their way to purchase electronically. It is also important to report in the conclusion that in e- tailing environment the respondents surveyed do not believe in patronizing a single website as may be the case in the marketing of retail, product or services. They like to shop on different websites which offer them good discounts, has less shipping

cost, insures privacy during purchase, has many options to pay for the selected products, has strong security features takes less time in processing the payments.

FUTURE SCOPE

The research work carried out can further be extended to develop more precise model by incorporating following suggestions in future; the electronic purchase environment is changing rapidly and is assumed to be ever evolving, so in days to come, it may be necessary to add or delete more elements to the present model. May be in near future some control variable be added to check the mediating effects on the model. The study was conducted only at ten most populated cities of India; it will be interesting to see whether there are some changes reported if the same study is undertaken at the national level. This study was a cross sectional study; there is every possibility of some change that may be cited if the same study is conducted in a longitudinal manner in near future. The scope will become wider if more consumer motives be added to the present study. In future more searches on literature may unfold some hidden agendas which may direct for future course of work. The researcher may adopt some other methodology to check the results whether they are the same.

EFFICIENCY MEASUREMENT IN THE LITHUANIAN RETAIL COOPERATIVES

Ramanauskas, Julius; Stašys, Rimantas

Department of Management, Klaipėda University, KU, Klaipėda, Lithuania

ABSTRACT

The performance of company is usually measured by several outcomes: profitability, internal rate of return, investment recoupment, labour productivity, etc. However, all those outcomes are predetermined by several or even several dozen factors. By using conventional performance assessment methods that reflect the general factor impact, the managers of companies find it difficult to assess the impact of each particular factor on the results and to take rational decisions. The activities of companies can be diverse; therefore, it is important to have a methodology for the objective assessment of the efficiency of the outcomes and the identification of the causes of ineffectiveness. The paper aims to develop a methodology for the company efficiency measurement by bringing out the activity-characterizing conditions-factors (the input), and the performance outcomes - indicators (the output).

The DEA (Data Envelopment Analysis) methodology shall be used in the paper. The DEA methodology, formally developed by Charnes, Cooper and Rhodes (1978), defines efficiency as a ratio of a weighted sum of outputs to a weighted sum of inputs, where the weights structure is calculated by means of mathematical programming, and constant returns to scale (CRS) are assumed. The advantages of the methodology are especially obvious in the fields where the outputs of the activity do not have monetary expression (land use, hospitals, cooperatives, etc.). The methodology used in the paper is based on the use of the data envelope. The performance of 23 Lithuanian retail cooperatives were assessed by 5 assessment criteria and the reserves of the performance improvement were identified.

Keywords: *measurement, efficiency, retail, cooperative.*

INTRODUCTION

The leaders of the agricultural cooperatives consisting of several farms as well as the large associations consisting of several companies find it important to define the most effective organizations that successfully deal with the funding, management issues, and effective distribution of their companies.

Moreover, performance assessments of several companies and the identification of the most efficient one are required by the public authorities when selecting the best candidate for the desired support of the European Union.

It is not so simple to use the conventional techniques in the performance assessment. The task requires accumulation of a large amount of the statistical data and the construction of a mathematical model of the economic entity's activity. Such statistical models reflect merely internal activity trends in a production process; therefore, management finds it difficult to assess the impact of each input in the production of an individual product and to take rational decisions. Moreover rapidly changing market conditions cause these statistical models to age; therefore new and properly adapted models need to be developed and implemented.

The aim of the paper is to develop methodology to assess the impact of individual inputs on the performance of retail cooperatives.

Research methods. Statistical data analysis, correlation and factor analysis, expert assessment methods, and the mathematical modelling method were applied by using data envelopment analysis.

The assessment method used in the paper was based on the use of the Pareto sets. The method was first described by M. J. Farrell (1957), and the consequent theoretical studies of the said method could be found in the works of R. D. Banker, A. Charnes and W. W. Cooper (1984), A. Charnes, W. W. Cooper and E. Rhodes (1978), and A. Charnes, W. W. Cooper, and R. N. Thvall (1991). The paper presents the performance assessment method of cooperatives that function under similar conditions; the method has been widely used in the works of Lithuanian and foreign researchers: A. Alvarez and C. Arias (2004), T. Baležentis and I. Krikščiukaitienė (2012), M. Gorton and S. Davidova (2004), D. Rimkuvienė, N. Laurinavičienė and J. Laurinavičius (2010).

LITERATURE REVIEW

When one talks about the company efficiency one usually means its success in producing the largest possible output from a given set of inputs. Provided all the inputs and outputs were correctly measured, the usage would probably be generally accepted. At any rate, the measure of *technical efficiency* defined below conforms to this usage (Farrell, 1957).

A company is considered efficient when it is able to reduce the amount of resources (input) it consumes and still generate the same amount of output, or is able to generate more output by using the same amount of input. Later, the findings may be able to help company managers to come up with the adequate responses for improving and maintaining efficiency (Selamat and Md Nasir, 2013).

Porcelli, F. (2009) wrote that efficiency is only one part of the overall performance and proposed a framework for performance assessment (Figure 1).

Figure 1. Framework for performance assessment (Porcelli, F. 2009)

A complete analysis also involves the measurement of effectiveness and the degree to which a system achieves programmes and policy objectives in terms of outcomes, accessibility, quality, and appropriateness (Worthington and Dollery, 2000).

John Seydel (2006) demonstrates how Data Envelopment Analysis (DEA), a tool that is typically applied more in post hoc evaluations can be also used with some modifications as a prescriptive decision support tool. Š. Bojnec and L. Latruffe (2008) also used the DEA method for their studies. They wrote that the studies of technical, scale, allocative, and economic efficiencies are rare for transitional farm businesses, especially in Slovenia.

Tzouvelekas, V., Pantzios, C. J., Fotopoulos, C. (2002) findings indicate that the organic wheat farms examined are relatively more efficient. They estimate technical efficiency using Kalirajan and Obwona's stochastic varying coefficient regression model.

METHODOLOGICAL FRAMEWORK

The activity of each cooperative (object) is characterized by pairing a factor (input) X and an outcome (output) Y . By placing the pairs of the said values of n objects (X_i, Y_i) , $i=1, \dots, n$ on the Cartesian coordinate system, we get a picture of the practically achieved outputs Y affected by inputs X (see Picture 2). In case the exact dependence of input X on output Y is identified, i.e. $Y=F_1(X)$, the efficiency of object k shall be calculated in the following way:

$$E_k^0 = \frac{Y_k}{Y_{k_t}} \quad (1)$$

i.e., the ratio of index value (Y_k) of the practically obtained output with the index value (Y_{kt}) of a theoretically possible output is calculated under the same impact of input (X_k).

Figure 2. *Efficiency evaluation principle*

Unfortunately, in most cases the exact dependence⁰ does not exist, therefore, a need emerges to get the most accurate possible substitute for it in some way. There are at least two possibilities. One, so far the most used, is to derive a mathematical model for such dependence by means of detailed research. The method requires huge costs; therefore, it is only applied for the establishment of particularly significant dependences. The second option is to work out a practical dependence that would be as close to the precise one as possible. The second option was used in the present paper; the practical dependence was obtained as a broken line, enveloping the actual data and passing through the points of the top-performing retail cooperatives. That way, the dependence $Y=F_p(X)$ was derived, with respect to which the efficiency of any object k could be calculated, i.e.:

$$E_k^0 = \frac{Y_k}{Y_{kp}} \quad (2)$$

The efficiency calculated on such a principle is called relative technological efficiency. It shows how relatively (but not absolutely) efficiently the impact of input X is used.

The so-called relative input efficiency is also calculated in an analogous way: it shows how sparingly the impact of input X is used. In accordance with the value of the said indicator, one can find out what

part of the impact of input X should be used (in comparison with the already used) in order to achieve the same efficiency. For object k in the demonstrated example, the efficiency shall be calculated in the following way:

$$E_k^1 = \frac{X_{kt}}{X_k} \text{ when } (Y = F_t(x)) \quad (3)$$

$$E_k^1 = \frac{X_{kp}}{X_k} \text{ when } (Y = F_p(x)) \quad (4)$$

In the formulas, 0 is relative output efficiency of point k , and 1 is relative input efficiency of point k .

We discussed merely the principle of the above-mentioned relative efficiency calculation. In its implementation, the establishment of the broken line is of the greatest significance. When assessing the efficiency of the object performance on the example of several efficiency-affecting inputs X_i , ($i=1, \dots, m$) and several obtained outputs Y_j , ($j=1, \dots, p$), the explained principle is realized as a mathematical model formulated in the following way: n assessed objects, which use inputs X_i , ($i=1, \dots, k$) in their activity, pursue maximum outputs Y_j , ($j=1, \dots, l$). To assess the outputs obtained by object p , one has to establish such U_o and V_j values as to:

$$\frac{\sum_j V_j^p \cdot Y_j^p}{U_o + \sum_i U_i^p \cdot X_i^p} \rightarrow \max, \quad (5)$$

$$\text{when } \frac{\sum_j V_j^n \cdot Y_j^n}{U_o + \sum_i U_i^n \cdot X_i^n} \leq 1, \text{ for all } n=1, \dots, N \quad (6)$$

$$U_o + \sum_i U_i^p \cdot X_i^p = 1 \quad (7)$$

$\geq 0, \geq 0, U_o$ is of any sign.

The efficiency measuring task expressed by the above mathematical model is a fractional programming problem which is transformed into a linear programming problem. To calculate the estimates for all the n objects, one has to solve n linear programming problems with $k+l$ variables and $n+k+l$ restrictions.

The present paper used the efficiency assessment model of the retail cooperative performance by utilizing the data of the correlation and factor analysis of the practical input and output studies.

Retail cooperatives (just like other cooperatives) are specific companies whose purpose is not so much to make profit as to create the conditions for the cooperative members to timely and profitably sell their produce. There are not so many retail cooperatives in the country (Lietuvos... 2014); therefore, it is very important for their founders to assess the conditions of cooperative formation and the efficiency of the projected activity. A cooperative signs contracts with the cultivators under which the latter start to trust the cooperative company to sell their produce or to sell it to the said cooperative company.

The functions of the retail cooperative include:

- the collection of the largest possible amounts of produce from the cooperative members and its storage given the character of consumption;
- sorting and processing of the produce;
- organization of the produce or the finished products sales;
- market analysis and provision of the members with the data of the analysis.

The paper studied the impact of different inputs on the efficiency of the trade cooperative performance.

EMPIRICAL RESULTS

Small family farms with low production and outdated technology are predominant in Lithuania and they have difficulty competing in the market. Small and medium family markets have to find new solutions to strengthen their competitiveness and one of those solutions is cooperation. However, despite of the different incentives that contribute to the development of cooperation in Lithuania, agricultural cooperatives have been developing slowly, even though cooperation is the best opportunity for the farmers to obtain and maintain improved share in the market.

At the end of 2014 there were only about 230 agricultural cooperatives in Lithuania (Žemės ūkio..., 2015). Lithuanian trade agricultural cooperatives, which focus mainly on dairy, grain, seed and silage trade have been developing the most successfully. At the end of 2008 mobile farmers' markets appeared in Lithuania; there are 25 in Vilnius and about 14 in Kaunas. However, the amount of the cooperation in Lithuania is insufficient due to various economic, management, social and psychological factors. A continuous analysis and assessment of the cooperation in Lithuania is needed in order to define developmental tendencies, sudden changes, existing and emerging problems which could be solved on a national level and at the same time incentivize the development and creation of competitive cooperatives. (D. Vidickienė and Ž. Gedminaitė 2009). The assessment methodology of the impact of individual inputs on the outputs of the retail cooperatives is developed in the following sequence:

- the outputs ($Y_{1,2,\dots,n}$) of the retail cooperative activity are characterized;
- the principal inputs ($X_{1,2,\dots,n}$) that predetermine the outputs of the cooperative activity are established;
- cooperative efficiency and the impact of individual inputs on their outputs is established by the means of the derived mathematical model.

The outputs of any company are characterized by a number of economic indicators: the profitability of sales, equity, and assets; the number of jobs in a cooperative company; goods capacity (the size of the member turnover in the cooperative); the number of the cooperative members; the economy of the working time of the cooperative members (farmers); and the savings of the investments of the cooperative members (farmers).

In order to define the outputs of the retail cooperative activities, we used the following economic indicators: sales profitability (Y_1); the number of jobs in the cooperative company (Y_2); the share of the produce sold by the members through the cooperative (Y_3); the economy of the working time of the cooperative members (farmers) (Y_4); and the savings of the investments of the cooperative members (farmers) (Y_5).

The retail cooperative (RC) activities are predetermined by a number of factors: average transportation distances for the growers of agricultural produce (X_1), provision with the means of transport (X_2), provision with storage facilities, equipment, and other means of production (X_3), the amount of production per 1 cooperative member (X_4), utilization of motor vehicles (X_5), the number of the RC staff per 1,000 Litars of the sold produce (X_6), the sum of the entrepreneurial characteristics of the management (X_7), the qualification of the management and the professionals (X_8), work experience of the management and the professionals (X_9), the co-efficient of the work time utilization (X_{10}), the goods delivery costs per 1 cooperative member (X_{11}), the amount of goods received from 1 supplier (X_{12}), advertising costs (X_{13}), marketing funds (X_{14}), market share (X_{15}), the sales prices (X_{16}), the amount of information about the cooperative (X_{17}), the stocks turnover predetermining the general turnover (X_{18}), the stocks turnover preconditioning the utilized capacity of storehouses (X_{19}), the assortment turnover (X_{20}), the demand for the staff in a cooperative company (X_{21}), the projected turnover (X_{22}), the price index of the purchase of produce (advancing money) from the cooperative members (X_{23}), and the geographical location of the cooperative company (X_{24}).

The retail cooperative's performance efficiency indicators and the impact of the inputs on the said indicators were calculated by means of the above mentioned mathematical model. An application was

designed that integrated the solution of a linear programming problem. The outputs for each retail cooperative calculated by the application were the following:

- the efficiency of the use of the inputs affecting the performance of retail cooperatives for each output and the general efficiency (see Table 1);
- the co-efficients of the inputs impact on the particular retail cooperative are presented in Table 2.

The outputs	Y1	Y2	Y3	Y4	Y5	General
Efficiency in %	75	63	95	100	89	88
The output weight coef.	0.11	0.18	0.28	0.26	0.18	1

Table 7. *Efficiency of the use of all the inputs and the weights of the outputs (example)*

As seen from the data in Table 1, in the pursuit of output Y_1 , the efficiency of retail cooperatives was 75%, and the weight of the output was 0.11 or 11%.

Inputs	X4	X5	X7	X10	X11	X13	X14	X16	X18	X22	X23
Impact coeff. for output Y1	0.05	0.04	0.11	0.07	0.14	0.03	0.08	0.16	0.14	0.10	0.08
Impact coeff. for output Y2	0.11	0.03	0.08	0.07	0.11	0.01	0.10	0.10	0.13	0.14	0.11
Impact coeff. for output Y3	0.18	0.06	0.07	0.04	0.10	0.04	0.07	0.12	0.14	0.08	0.11
Impact coeff. for output Y4	0.12	0.09	0.10	0.13	0.03	0.09	0.06	0.04	0.15	0.12	0.07
Impact coeff. for output Y5	0.11	0.03	0.10	0.04	0.14	0.10	0.16	0.04	0.16	0.07	0.05

Table 8. *The impact of the inputs on the outputs (example).*

As seen from the data in Table 2, in that particular retail cooperative the profitability of sales Y_1 , e.g., was the most affected by the goods delivery costs X_{11} (0,14) and the stocks turnover X_{18} (0,14), while the least affected by advertising costs X_{13} (0,03).

The results' effectiveness could be objectively measured and the causes of ineffectiveness could be identified based on the presented methods. The analysis carried out by means of the developed methodology allowed to identify both the most efficiently operating cooperatives and the most effective (optimal) size of the cooperative; it also helped the management of the individual cooperatives to identify whether the use of individual inputs was appropriate or not. Government institutions use the presented methods (for example National Paying Agency under the Lithuanian Ministry of Agriculture) to define the most efficient company that would be worth receiving European Union subsidies

National Paying Agency under the Ministry of Agriculture

CONCLUSIONS

- The assessment of the company performance efficiency by the individual indicators may be misleading because while one indicator shows the cooperative performance to be efficient, the

other indicator might indicate the cooperative to be inefficient. Therefore, a comprehensive examination and assessment of all the indicators is necessary.

- A model was developed on the basis of the assessment of operating conditions typical to the majority retail cooperatives by bringing out the activity characterizing conditions: inputs and outputs.

THE CONTRIBUTION MARGIN IN COMMERCIAL COMPANIES OF FURNITURE. SOME CONSIDERATIONS FROM THE ITALIAN CONTEXT

Rossetti, Luigi Umberto; Migliaccio, Guido ¹

Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

ABSTRACT

The still relevant global crisis has interested different geographical areas. This paper wants to focus on the situation in Italy with specific reference to commercial furniture companies. For years, the furniture trade has been affected by a different social order characterized by the crisis of the more stable traditional family with the will to invest in comfortable, long-lasting environments. The temporary nature of emotional relationships has led to choose furniture qualitatively inferior, especially foreign-made.

In this structural worrisome situation dramatic outcomes of severe international economic crisis have to be added. Considering, therefore, the trends of the furniture market, this paper shows, first of all, the actions of political power in support of a sector in crisis today, which for decades has been, however, one of the most flourishing of the Italian economy.

The highlight for the need of an adequate cost accounting follows, which has in the contribution margin its main indicator. This margin specifies the informative value, the different methods of determining the main variables that lead to its amendment; emphasizing the especially difficult ones to define those costs that may affect the convenience of commercial transactions. The continuous monitoring of this margin should facilitate appropriate re-launching management strategies of each company. This careful analysis of the profits formation must be added to the renewed marketing strategies, on which already exist useful scientific contributions.

Keywords: *Contribution margin; Furniture; Trade of furniture; Cost accounting; Commercial companies.*

INTRODUCTION AND MOTIVATION

¹ The paper is the result of a collaborative work. However it is possible to attribute to Luigi Umberto Rossetti: furnishing market in Italy (facts), latest public actions for the revival of the sector, typical aspects of accounting firms in analytical commercial interiors, contribution margin in particular, and possible strategies. The other sections are of Guido Migliaccio.

The recent economic crisis affecting the greatest powers of our planet production, has had its considerable effects in Italy too. Almost all the productive industry sectors, trade and services have been involved.

The increase in unemployment, and therefore the least disposable income, has reduced the demand for consumer goods and those ones intended for durable use.

Among the latter, the furniture and all other means of furniture used in every typical.

One of the most important commercial and productive sectors of the entire nation has therefore greatly been affected by the crisis.

In fact, for years, and even before the recent crisis, the traditional decor has suffered the consequences of demographic trends disinclined to invest in high quality furniture.

The crisis of the traditional family and the increase of unstable couples have instead favored lower quality furniture, although the cost of it is low or average. This new social context has thus penalized the finest artisan products, in favor of the furniture import, that is practical but certainly far from the aesthetic style that has always characterized the "made in Italy".

The public power intervention for the revival of the sector has been a (harbinger) sign of significant changes aimed precisely at reducing the effects of this crisis.

At the same time, marketing studies have been developed aimed at new relationships with potential customers and to confirm a significant presence of the Italian industry abroad.

Within the industrial and commercial companies, however, it is still lacking the spread of a cost accounting required to provide timely information to the entrepreneur for selecting appropriate supply and sale.

This paper is conceived as an integration toward this significant but unacceptable failing of the Italian economic scientific studies and it proposes some suggestions especially related to the informative power of the contribution margin.

AIMS AND STRUCTURE OF THE PAPER

With regard of this, the paper wants therefore achieve the following objectives:

- Present the main scientific studies related to the economy of Italian companies commercial furniture;
- Highlight the gaps related to these studies, which often appear out of date and too biased toward marketing;
- Outline the main current trends in the furniture market sales;
- Illustrate the actions of the political power aimed at revitalizing the commercial furnishings in crisis;

- Explain the importance, functions and features of a system of internal control and management of commercial furnishing companies;
- Focus on the informative value of the contribution margin to be considered as a necessary driver control by management companies.

These objectives are aimed to be achieved progressively in the development of the paper that, as it is normal, begins with the literature review restricted to the Italian context to which the main considerations are referred to.

The illustration of the trends of the domestic furniture market follows, and it highlights the crisis of the last decades, due not only to the broadest international crisis.

Therefore, the presentation of the national standards in recent decades have attempted to deal with the crisis of the internal and external demand for the typically Italian furniture and to oppose the import of qualitatively lower furniture. The laws exposure on the subject, highlights the positive and negative aspects of a still commendable economic policy attempt.

Among the answers that entrepreneurs have provided, marketing surely those already analyzed by the doctrine, it is necessary to highlight the need for an adequate internal information system that encourages timely decisions that are economically and financially useful.

The cost accounting, especially, should provide information about the cost of the product in consideration of the high fixed costs that commercial companies must sustain to submit furnished environments that stimulate purchase.

Among the different tools that accountancy offers, the attention is focused on the contribution margin presenting variables typical of the commercial furniture industry and especially those costs that are more difficult to define and that could compromise the convenience of any transaction.

The monitoring of the contribution margin also favors the drafting of appropriate strategies for a "return value".

ITALIAN LITERATURE REVIEW (NOTES)

This paper only presents the situation commercial furnishings situation in Italy. For this reason, the literature review refers only to the Italian scientific production whose literature is not very rich, and especially not up to date with recent years characterized by the severe economic crisis that has involved the full field.

Some writings focus on the characteristics of the entire production chain, starting from the raw materials to the use of the furniture in the Italian families: April, 1999; Traù, 2003; Gargiulo, 2005; Gargiulo and Zoboli, 2007; Dal Bosco and De Martin, 2011.

Others focus on the production processes in the network or in the context of some industrial districts (Bednarz et al., 2011, p. 97 and ss.; Cariani, 2010, p. 260 and ss.; Brunetti et al., 2007, p. 73 and ss.).

The writings of the most consistent and numerous ones, however, are relative to the interior and the furniture marketing, and try to focus on the typical commercial tools in order to promote sales: Marelli, 1999; Grandinetti and Chiarvesio, 2002; Lojacono and Carcano, 2001.

Sometimes it is accentuated the value of some of the factors that enhance the product thus favoring the marketing. For example: the Italian Style (Snaidero, 2005), or more generally the market opportunities arising from the certification of the product quality (Arrigoni, 2001) better if certified (Martelli, 2000).

Many studies published in the Italian international furniture marketing trade are significant which consider the good placement of national exports that take definitely advantage of a style popular in the world: Politi, 2000; Lojacono et al., 2012; Lojacono, 2007. Some publications are related to marketing and penetration in certain countries: US (Lojacono, 2004), and India (Chiarvesio, 2014), in particular.

In some cases, many tools used in other areas are enhanced, such as the franchise (Tosini, 2001), or other methods that try to deal with the typical problems of financial management of businesses (Lojacono and Guerini, 2008).

Furthermore, it is worth noting some professional publications related to the recent Italian government incentives aimed at revitalizing the area in question. (Roncher, 2015 and Donati, 2014).

However, very few are the analytical accounting publications applied to commercial companies of furniture. There is in fact only one volume, outdated, especially relative to the stage of the industrial manufacture, rather than to the commercial one (IASM, 1981) and some other writing which focuses on the remarkable impact of the unsold inventory furniture cost (Righetto, 1998).

To have a more widespread Italian bibliographic production is therefore necessary to turn to generalist volumes related to commercial enterprises which, however, only rarely focus on the typical economy of the company's commercial furniture distribution. These deficiencies have led the authors of this paper to an in depth analysis afoot of subsequent developments.

FURNISHING MARKET IN ITALY (FACTS)

The furniture market has always been one of the most dynamic and important in the Italian manufacturing, reaching since the 1980s, very high levels of purchase equal to 2% of the total private consumption of the period (Gargiulo, Onida and Traù, 2009). The piece of furniture "made in Italy", characterized mainly by small and very small companies reached its highest level in terms of number of firms and employees.

Figure 1: size classes of the wood industry (Centro Studi Fillea)

At the beginning of the new millennium the first and most important change in the industry is carried out with the creation of specific areas organized in complementary sectors of production (Gargiulo, Onida and Traù, 2009). We witness the creation of the "induced furniture makers" or "furniture districts" characterized by the processing business in mid-sized companies specialized in the processing of specific parts or materials (Brunetti, Marelli and Visconti, 2007).

The furniture market has been characterized, in recent years, by a strong dynamism: to an evident decline in sales increasing from 42.5 billion to 27.2 billion (2007-2013) is counterposed by a decrease in jobs and the closing of many companies.

The global crisis of the years 2007 - 2009, which certainly has had its negative effects on the industry, is not the only cause of this negative trend. The crisis comes at a time of major changes both geographical (relocation) and competitive (new competitors) (Lojacono, 2007).

The structure of the sector, which has remained unchanged, divided by districts located mainly in North Italy, suffers from a very strong and competitive skimming only the best firms survive while the less efficient ones exit the market.

Figure 2: *Industrial district of furniture – Istat*

The last period has been characterized by a strong suffering of the internal market; export growth has failed and still fails to prevent further loss of production.

The impact of the crisis on consumption is evident as well as the collapse of confidence in the Italian country system; the furniture sector is experiencing a new scenario: the decline in consumption, the growth of large retail, the difficult access to credit, in a continuous and changing economic and regulatory trend (Lojacono, 2007).

Figure 3: *Italy consumer confidence indicator - Istat*

The growth of retailing depends differently on the type of furniture distributed and on geographical areas; from the geographical point of view it is still evident the difference between North and South, which, however, has recorded a strong increase in percentage, mainly due to the emergence of large shopping centers and to the furniture specialists supply enlargement (Lojacono and Carcano, 2001).

(Poltronasofà, Chateau d'ax, Natuzzi, Point furniture, Ikea, Mondo Convenienza, Centro Convenienza etc.)

Figure 4: GDO in Italy (Scavolini – Csil)

The furnishings are characterized by extensive modularity and require specialization in the assembly, with the biggest difficulties of distribution through supermarket chains; situation evident in the comparison between the general distribution of furniture and one of the kitchens.

Figure 5: Distribution Channels 2012 (Scavolini – Csil)

The next few years will still be difficult for the sector despite the growth of international trade; the recession in Italy will lead to a further decrease in the production of furniture and a stabilization of prices.

Macrosistema ARREDAMENTO

Imprese	30.763	30.318	-1,4%

Figure 6: Furnishing macrosystem (Centro Studi Federlegno Arredo Eventi SpA)

LATEST PUBLIC ACTIONS FOR THE REVIVAL OF THE SECTOR

The first state intervention regarding the purchase of furniture and appliances dates back to 2010 and provided an incentive until the funds were allocated.

In case of success, confirmed the availability of the funds, the incentive would have been applied in the form of a reduction to customers who subsequently would have recovered the sum deducted from the sale price. It is currently in force (with extension until the end of December 2015) the Law Decree 63 of June 4, 2013, containing several measures to revitalize the construction industry including the Bonus furniture. It is a measure of tax incentive that allows the buyer to deduct from the (individual income) tax return documented expenses related to the purchase of furnishings, in order to be allocated to buildings that have been restructured or will be in the future (Donati, 2014).

Both incentives have affected, though in different ways, the commercial management of companies; in the first case, the customer paid deducted amount incentive, whose upper limit was set at one thousand euro. Only later the company would have been part of that amount, that is after making a double change in a financial accounting active, one towards the customer and the other towards the State for the amount not paid by the same. This system has shown a strong criticism due to the considerable credit delay of these amounts from the State, often generating, (in the presence of many practical facts) situations of illiquidity.

In the second case, the amount paid by the customer was full, so, the company took, through the indicated means of payment, the full amount. This system too presented, and presents, critical issues. The same Stability Law provides for the increase from 4% to 8% of the withholding tax withheld by banks on transfers for the energy upgrading payment and renovation of buildings that benefit from the deduction of 50%. Therefore, also in this case, companies do not bank immediately the total amount, but an inferior amount (sale proceeds less withholding tax) creating possible illiquidity in this case too.

In the last quarter of 2013, the Bonus Furniture has affected sales by 4% and in the first two months of the year 2014 by 0.6%, representing the first positive sign after years of reductions in revenue. The next few years will surely be characterized by uncertainty especially in the domestic market. The hope is that the resources won't be diverted from economy and with the confirmation of the bonus for the furniture we can suggest an arrest in the decline in the furnishing consumption as it happened in the past (Roncher, 2015).

Figure 7: *The furniture sector in Italy 2009/2016 (source Csil)*

The tax incentive policies have failed to reverse the negative trend in sales volumes in a depressed economic environment characterized by a decrease in the purchasing power of households, difficult access to credit and the contraction of the housing market.

	Volumes	Prices	Value
2011	-3,1	1,9	-1,3
2012	-9,3	2,1	-7,4
2013	-6,7	1,1	-5,7

Table 1: *The furniture sector in Italy (variations in %)*

It seems clear, in terms of turnover, the impact that the Government intervention in the economy has had in favor of the furniture industry which has seen, over time, a gradual decrease in sales volumes which was complemented by an inexorable decline in the margin contribution (MCD).

TYPICAL ASPECTS OF ACCOUNTING FIRMS IN ANALYTICAL COMMERCIAL INTERIORS

For many years the furniture industry market research has revealed that the product only, although crucial, can no longer guarantee the success of a company or a store. The consumer gives growing importance to the service factor in determining his own level of satisfaction. The service appears to be a critical success factor because it is difficult to imitate and the related expectations are generally very high. It can be divided into pre-sales, sales and post-sales. The greatest criticism concerns above all the previous phases but especially the post-sale one where important issues, not easily detectable in the general ledger, are observed (Marelli, 1999). It is in the cost accounting that the details and the information of a company are provided (revenue costs). The new competitive scenario is set in a market; size no more sufficient for everyone, shows a tendency to preserve, and not proportionally reduce, its market share or the intention to moving toward other markets (Lojacono, 2012).

Therefore, the issue is to increase the sales in order to maintain or even increase its market share, but, above all, to increase the overall contribution margin of the store.

CONTRIBUTION MARGIN IN PARTICULAR

The Contribution Margin Unit considers the difference between unit revenue and unit variable cost without considering how the product will be able to cover the fixed costs. It provides a guidance unit not indicative of the overall decision but surely useful for the furnishing specialist companies or single-product, or for strategic evaluations for products "owl".

If from the net revenues is subtracted the cost of goods sold and other variable costs (most of all of the commercial kind), we obtain the Contribution Margin, therefore representing the contribution from operations to cover the fixed costs and the achievement of the profit.

This margin has a decision-making utility in the short term because in the medium/long term the distinction between fixed and variable costs decreases. In the furniture industry, this margin, is usefully located in strategic decisions related to the ratio determination of sales-product quantity/price; greater quantities sold at lower prices or reduced quantities at higher prices. It is clear that this indicator is a separator between the variable costs and fixed costs of the company, representing the most powerful indicator of the business good management, highlighting the validity of the purchasing policy, sales and adaptability and evaluation of the problems of the market.

The analysis of contribution margins is used primarily to control the customer profitability orders as well as for the overall assessment of the business enterprise; its determination is in the evaluation of the strategic positioning of the company and for the commercial management (formulation of product prices). The focus of the commercial companies to the precise determination of the contribution margin is confirmed by the strong attention of the main management software house who have inserted inside calculation functions, monitoring of the same and statistical functions.

The reduction of the Contribution Margin depends on many factors that may be internal or external. The "variables" elements typical of a commercial activity in the furniture industry can be summarized as follows:

Commissions seller/decorator	Design costs
Transfers seller	Relief measures
Transport costs in outsourcing	Assembly costs in outsourcing
Rental equipment external	

Table 2: *main variable costs in commercial companies*

The main fixed costs can be summarized in:

Salaries and contributions	Leases
Leasing	General subscriber
Indirect taxes	Depreciation expense
Financial burden	Financial cost

Table 3: *major fixed costs of commercial companies*

It is clear that from the list price excluding VAT, you must subtract the discount applied to the customer getting the buyer sold excluding VAT; after that, you must subtract, still from the list price, the discounts reserved by the supplier to the retailer. The difference between that value and the sales excluding VAT gives us the First Contribution Margin.

Prime Contribution Margin is, therefore, the difference between the total value of the sale and the goods sold net variable cost. From this value must be subsequently deducted the costs "variables" mentioned above in order to obtain the Second Contribution Margin; the latter, then, is the difference between the value of the First Contribution Margin and the sum of the variable costs.

The value of the Second Contribution Margin, also called "coverage ratio", allows to prove if it is sufficient to cover the fixed costs that have incurred, regardless of the volume of the sales. This margin is mainly used as a medium/long term decision support.

In the furniture industry are present, however, other variable costs "hidden", defined as "costs after sale", whose prevision and quantification is very difficult to define. It's all the costs that may arise from unforeseen circumstances, additional issues or disputes after the sale.

1. Product			
Non compliance	Damage products	Missing or partial product	
2. Assembly			
Improper assembly	Impossible assembly	Goods damaged	
3. Suppliers

Table 4: *main causes, internal or external*

These variable costs consist of the direct cost of the product and of all the replacement costs (es. Travel costs) to which can be added the financial charges for late payments (credits v/s State), increases in withholding taxes or unsalable goods, such as bits of shows or exhibitions.

Since the reduction of sales increases the incidence of fixed costs on turnover, the first action to be done is a revision of the same, that should not be seen solely as a real cut, but simply as a redistribution and optimization in the overheads.

It is obvious that the only costs that cannot obtain a precise control, because they cannot be measured or expected and therefore not perceived precisely, are the after sale costs. These affect the margins substantially and almost always derives from the company's operational difficulties, management and organization.

To the after sales costs is added the incidence of costs generated by the power / strength of some big brands / suppliers affecting strongly and authoritatively the companies' investment decisions and purchase.

Some companies, while escaping a relationship of exclusivity to sell the product, mandates a minimum investment of product exposure and investment in promotional material exhibition. Some products, characterized by modular elements, in the replacement, once on display, will result unsaleable or difficult to use; a typical example are the kitchens work plans; these affect the Contribution Margin like the unsaleable products.

To a lesser extent, and in the cases provided by law, the unpredictable financial expenses related to incentive measures established by the various governments are set. A decrease in financial charges carries a lower cost of debt with obvious effects on the operating result.

Faced with an uncertain demand and not easily predictable, is of a relevant matter the loss of margins contributions relative to the cost of the resulting products unsaleable or difficult to sell. The big brands are using their power force on insertions in exhibitions of furniture stores who are forced towards investments "required" in the latest products. This obligation of investment of "exposure" products, generates almost always, in the furniture store shows, residues of non-sellable or difficult to sell elements. The reference is toward the modular products (kitchens) compounded by distinct unchangeable parts and therefore not always adaptable to the customer needs.

POSSIBLES STRATEGIES

The contribution margin in commercial companies in the furniture industry is fundamentally linked to the sales policy used by the store. Increasing the overall margin is possible by increasing the number of annual fees; from the sale of ancillary services to the purchase of the product, from the increase in the average of the Committee, or acting on the unpredictable costs.

To increase the number of the committees made, you can increase the number of turnout at the store or improve the effectiveness of the vendors in terms of the conclusions of contracts. Another possibility is making some ancillary services, free so far, for a fee; in order to charge the customer of some of the services related to the sale such as graphic design, delivery and assembly or collection of used and / or removal and disposal products.

The increase in the average of the Committee can be achieved either by increasing the average level of sales of the products, or adding to it the sale of furnishings.

Finally, companies have to face the problem of the reduction and the recovery of the contribution margin primarily through interventions and / or optimization of:

Fixed Cost	Company procedures	Relationships with suppliers
Customer loyalty	Higher profitability	Products on display
Management review	Financial flows	Pre-sales
Sale	After sales	Full cost to direct cost

Table 5: *main critical*

Such recovery activities must remain within a field of preservation of the quality of the products and/or services; the use of poor quality products, unskilled labor, not adequate exhibits, if in the short term, will certainly provide an advantage for the company, in the medium/long term can become a critical corporate image and its competitive position.

CONCLUSIONS

The analyzes presented of specific field of production companies have definitely Italian international interest. The entire chain of furniture, and especially the terminal phase of the commercialization of furniture, can be considered exemplary situations of systemic change induced by innovations in consumption and, in recent years, the international economic crisis. The required skimming of marginal holdings was in fact generated primarily by social and demographic changes that have characterized the traditional markets. The replacement of the dominant model of family induced to invest less in furnishing, furniture preferring practical and economic to better quality and more expensive.

The other effects of the economic crisis, especially the reduction in consumption and credit, have had, in the sector under analysis, similar consequences for other production areas.

Again, however, we must emphasize its own typical: the strict relationship between the product and services, as already highlighted appropriately. In today's society the services have taken, as a rule, a growing role, to become prevalent in some cases. The crisis, however, for some products had opposite effects: just to economize, some families prefer to manage services in economics definitely required

before the dealer. This is evident in the lower segments of the market in which there is increasingly left to the buyer the right to carry and assemble themselves, economizing, or delegating to other such steps and bear the costs.

A final element must be appropriately emphasized that typical feature of the sector: the power relations described between large manufacturing companies, large groups and small business retailers peripheral. The latter often have to succumb to the logic strategic drafted elsewhere, in order to ensure the availability of products. This compresses their spirit and their decision-making autonomy, forcing them to roles of mere executors of decisions taken independently of their local experiences, though significant. In conclusion, it is evident, from the earliest described, that an analytical accounting of the costs and, in particular, an adequate and timely calculation of the contribution margin for each product, can foster a more organized and profitable, even in commercial marginal more modest size. Obviously this implies spreading accountancy and managerial skills that should prevail with respect to administrative and fiscal unfortunately sometimes almost exclusive. This first analysis of the sector should be followed in the future by further study, especially of business cases, to reach conclusions more analytical underpinning the concrete experiences of empirical reality with the dictates generalists that science offers managerial

THE FINANCIAL CHOICES OF SMES. THE MAIN PROBLEMS OF ITALIAN AGRO-FOOD FIRMS' ACCESS TO FINANCE

Rossi, Matteo¹; Siggia, Dario ²

¹DEMM Department - University of Sannio

²Department of Agricultural and Forest Sciences, University of Palermo and Member's Office of the Chair of ENVI Committee European Parliament

ABSTRACT

Small and Medium Enterprises (SMEs) represent a huge portion of the firm tissue of developed countries, but they have not adequate attention. In fact, various researchers have focused their studies on larger and well-known firms. This paper aims to investigate the access to finance of SME, with a specific focus on agro-food micro firms. Access to finance is key in business start-up, development and growth for SMEs, which have very different needs and face different challenges with regard to financing compared to large companies. The lack of equity invested in small firms makes them more dependent on other sources (e.g. bank lending). The limitations of the paper are the result of its very nature: it is a largely conceptual paper. Empirical research is therefore needed to test and validate the essentially preliminary framework.

Keywords: *Agro-food firms, Financial Choices, Internal Source, External Source, Bank loans*

INTRODUCTION

Small and Medium Enterprises (SMEs) represent a big portion of the firm tissue of developed countries (Figure 1). In fact, the 20 million European SMEs play an important role in the European economy. In 2012, they have represented 99.8% of total number of firms, and 66.5% of all European jobs for that year (European Commission, 2013). During 2012, the SME sector as a whole delivered 57.6% of the Gross Value Added generated by the private, non-financial economy in Europe 2012 (Eurostat, 2013). All these data show the importance of these firms, but they not always receive the right attention. The emphasis on big firms undermined the development of young and small firms, which do not have access to public markets (Zingales, 2000).

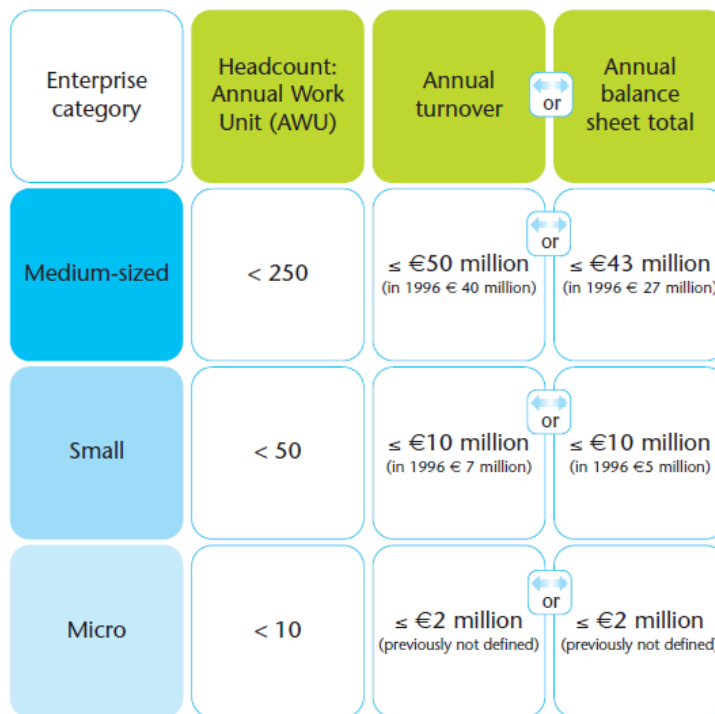

Figure 1. The new SMEs definition

Source: European Commission (2013)

FINANCIAL SOURCES FOR FIRMS

The lack of economic capital is one of the most important obstacle to growth. The management of the capital factor, since the acquisition until the time of its use, will require a decision-making process focused on quantitatively and qualitatively capital resources observed both in their origin - sources - and in their destination – uses (Rossi, 2014). Funds differ in various stages of a company's life cycle (Figure 2).

In the start-up phase, the family of owner and/or business angels are the main investors of new firm. Start-up financing is used for product development and initial marketing activities. Enterprises may still be in the creation phase or have just started operations, without having sold their product. At this stage, money is important to pursue R&D activities. When the product has taken form, a certain number of Venture Capitalists will join the firm: they want to set up the firm. After formation, the firm has developed its product and it requires more financial resources to commercialize it. The firm has not generated profits yet, since the step of Expansion-Development is high progression process. At this stage capital is used to increase production, to develop new services/products, to finance acquisitions and/or to increase the working capital of the business (Rossi, 2014).

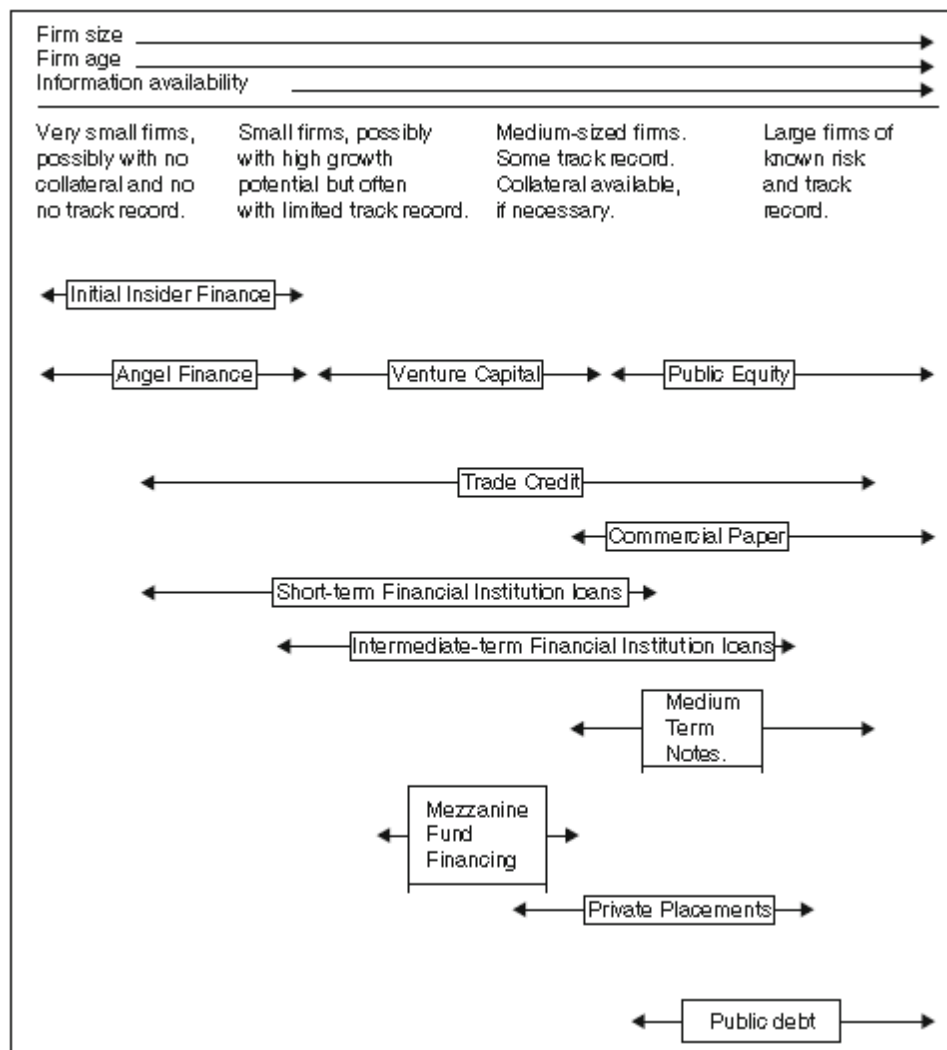

Figure 2. Application of the Life Cycle Approach to the SME Sector

Source: Berger and Udell (1998: 623)

Firms need different capitals in different stages of their life. Financial resources can be classified into external sources and internal sources; the internal sources are all financial resources from inside the business, external sources are all financial tools from outside the business.

Internal finance tends to be the cheapest form of finance since a business does not need to pay interest on the money. However, it may not be able to generate the money that the firm is looking for, especially for larger uses of finance. There are three internal sources of finance:

- Retained profits,
- Sale of existing assets, and
- Cut down stock levels.

External sources can be divided in long-term, medium-term, and short-term. Short-term financing have a repayments period of less than one year. Medium-term financing are those with a maturity

period of more than one-year but less than 5 years. Long-term financing are those with a maturity period of 5 years and more.

There are a lot external sources of finance:

- Bank Loan or Overdraft,
- Trade Credit,
- Factoring,
- Leasing,
- Hire Purchase,
- Shares,
- Long Term Bank Loans,
- Grants, and
- Private Equity, Venture Capital, Business Angels.

The use of external financial resource is linked to principal disadvantage of internal resource (Table 1).

ADVANTAGE	DISADVANTAGE
Capital available	Expensive: is not tax-deductible
No interest	No increase of capital
Spares credit line	Not as flexible as external financing
No control procedures regarding creditworthiness	Losses are not tax-deductible
No influence of third parties	Limited in volume

Table 1. Advantage and Disadvantage of Internal Sources

Source: author's calculation

In fact, internal resources are limited in volume, and this requires external investors. External financing can help jump-start of business, but it also has drawbacks (Table 2).

ADVANTAGE	DISADVANTAGE
Faster Growth	Loss of Ownership
Greater Economies of Scale	Loss of Control
Leveraged Return	Cost
	Cash Flow

Table 2. Advantage and Disadvantage of External Sources

Source: author's calculation

Starting from the seminal papers of Modigliani and Miller (1958, 1963), a lot of financial researches have focused their attention on optimal capital structure. One of the most important researches was conducted by Myers and Majluf (1984); they argued that it exists a hierarchy in the financing funds of firms. Due to informational asymmetries, firms will prefer internal to external capital sources. The limitation of internal resources conducted owners of SMEs to select external capital sources. In these cases, they chose short term debt, because it does not reduce managers' operability.

THE ITALIAN AGRO FOOD SYSTEM

The Italian food industry is a fundamental part of the country's economic system and represents an important sector of its manufacturing industry (Crescimanno et al., 2015). In recent years the food industry has been affected by the wider decline and loss of competitiveness of the Italian industry. Italy's products of designated origin continued to increase in number, achieving 210 registered PDO and PGI products (22.6% of the EU total). Most of Italy's PDO and PGI products are fruits, vegetables and cereals (nearly 40%), extra-virgin olive oil (19%), cheese (17.6%) and prepared meats (almost 16%). Neapolitan pizza has become Italy's second TSG (Traditional Specialty Guaranteed), following mozzarella (Rossi et al., 2014).

The agro industrial system is made up of a number of activities through which agriculture interacts with all the sectors connected to it, up and down the supply chain: from the industry inputs (fertilizers, pesticides, animal feed, energy, etc.) to the food processing, distribution and catering industries. The agro-food sector is estimated to will be worth some 246 billion euro (over 16.2% of GDP) at the end of the decade. The main contributions were: approximately 25 billion euro from agricultural value added (VA), 22 billion euro from intermediate consumption in agriculture, 17 billion euro from agro-industrial investments, 26 billion euro from VA in the food industry, 39 billion euro from VA in the catering industry and 99 billion euro from marketing and distribution (Figure 3).

ACCESS TO FINANCE FOR ITALIAN SMES

In agreement with the European Commission SME definition, this paper considers a sample of small and medium firms located in Italy. This sample has been extracted from AIDA, a database of Bureau

van Dijk, which contains economic and financial information with up to eight years of history of more than 200,000 Italian firms. Before this analysis, this paper analyses the main problem in access to finance for Italian small and medium firms.

4.1 MAIN PROBLEMS IN ACCESS TO FINANCE OF ITALIAN SMEs

Access to finance is one of the most important problem for Italian SMEs. Italy performs well below the EU average, with signs of increasing deterioration (Figure 4). Banks are less willing to provide loans to SMEs, and this indicates a drying up of private-sector financial support.

Figure 4. Firms most pressing problem

Source: European Commission, 2013

In line with the long payment times for public authorities, the total invoice payments time remains one of the longest in Europe (117 days), double the EU average (53 days) (European Commission, 2013).

Problems continue in the wider interest rate spreads between small and large loans and the absence of private equity and venture capital investor, particularly for early-stage investments. Despite the efforts realized from Government to sustain new and traditional forms of financial instruments, Italian SMEs still suffer from a chronic and structurally difficult access to finance. The main problems are:

- the increased administrative rigidity of banks in providing loans,
- the higher differential rates between Large firms and small and medium firms.

RESEARCH METHODS AND RESULTS

The analysis of the principal weakness in financing Italian agro-food SMEs is the basis for the research. Data was obtained through a survey of business firms. The research was realized with CFOs, responsible for capital budgeting decisions. In order to achieve this goal, a total of 85 entrepreneurs-managers were targeted as potential respondents. Due to the nature of research, the study focused primarily on CFOs and managers who are involved in the capital budgeting decisions.

The aim of pilot testing was to check the relevance of questions before interviewing. Out of the 85-targeted interviews, a total of 27 interviews were successfully conducted. This gives a response rate of about 31%.

5.1 MAIN RESULTS

The following section discusses the main findings and results of the survey on capital budgeting techniques used by Italian firms. The first classification has regarded the business size and sector of firms involved. From the total 27 respondents 29.63% qualified as medium enterprises, and the remaining 70.37% were categorized as small businesses.

The survey sought to find out whether there was any relationship between financial decision maker and their level of qualification. In fact, there is a different involvement of respondents to the survey.

Figure 4 shows the formal educational qualifications of the decision makers of the respondents.

Figure 4: Qualifications of Personnel Responsible

Source: author's calculation

The research highlights that those decision makers that did have an High School Diploma mainly used Bank Loan or Overdraft as compared to those that received formal training. However, a deep analysis revealed that the use of financial instrument more sophisticated (Factoring, Leasing, etc.) was more used by those that received formal accounting-finance training. A closer look at those firms that used more than one source of finance indicate that the majority of them belonged to the post graduate category.

Another important step of the research was the analysis of responses given per category of firms. The results confirm the theory that SMEs have preferred financial sources: bank loans. In fact, about 70% used bank loans or Overdraft and as firms increase in size they begin to use more financial sources.

External financial sources present an important cost: interests. In our interviews we asked to CFOs which is the interest rate. This aspect is fundamental because is a signal of entrepreneurial awareness in financial choices. The research highlights that SMEs decision makers don't have a specific awareness of interest rates on loans. They consider interest rate as a constant, but this is a crude approximation to reality.

Decision makers play a key role in financial choices. Different organizations use different decision makers to realize their financial choices. Table 3 shows that decision makers are responsible for the selection of better financial sources according to the size of the firms.

Decision Makers	Small (%)	Medium (%)
Owner	81	65
Chief Financial Officer	9	20
Team Decision	10	15

Table 3: Decision Makers

Source: author's calculation

The above results show that about 75% of business owners are directly responsible for choices of financial sources. Furthermore, the results suggest that different business level managers have limited influence on this decision-making process. However, the influence increases with the increase in the firms' size. It seems that, where present, the finance section had a significant influence in all decisions making scenarios.

A similar view can be expressed as regards to the role played by teams. A possible explanation is linked to the nature of small businesses. The majority of the interviewees in the small firms had limited operational structures, generally associated with larger corporations. This may be a reason why owners defined financial choices in small firms. However, the same reason cannot be attributed to larger enterprises. In fact, they have more formalized structures and large work forces.

CONCLUSIONS AND RESEARCH LIMITATIONS

This research has revealed the nature of choices of financial sources of agro-food Italian firms. Particularly, in this research two different variables were considered: the impact of the business size and the level of education of decision makers.

This research has demonstrated that financial choice is a complex process, but it is under evaluated from SMEs. In fact, in these firms business owners are directly responsible. In most of the cases of the sampled firms the decisions makers have taken choices without appropriate training (Rossi et al. 2012).

The limitations of the paper are the result of its very nature: it is a largely conceptual paper. Empirical research is therefore needed to test and validate the essentially preliminary framework developed and the (well-based) assumptions made towards its development. Particularly, the most important limit is the definition of company size that was based only on the number of employees. Other indicators of business size such as capital employed and turnover were not considered.

This research has an exploratory aim and its findings are far from definite. They rather represent a starting point, a base for further research and analysis. For this reason the empirical results should be interpreted in view of some limitations: the sample of firms is random and does not fully conform to the criteria of statistical representation; the sample of companies could be expanded numerically.

SAAS ADOPTION: CRITICAL FACTORS FOR CRM APPLICATIONS

Rossignoli, Cecilia¹; Zardini, Alessandro¹; Mola, Lapo²; Francesca, Ricciardi¹

¹Department of Business Administration, University of Verona, Italy

²Department of Information Systems, Project and Supply Chain Management, SKEMA Business School, France

ABSTRACT

Software as a Service (SaaS) approach is a demand-driven application that provides network-based access to an integrated portfolio of applications across the virtual value chain of an enterprise. Therefore, the aim of the present paper is to investigate the organizational technological and economic factors, which influence the adoption of SaaS for Customer Relationship Management (CRM) applications. The theoretical framework refers to Transaction Cost Theory (TCT) and Resource Based View (RBV) Theory. The research is based on the case study method and analyses four companies of big dimensions, which have adopted the SaaS approach at least for three years. The results show the importance of some organizational factors such as the optimizations of marketing processes, while other factors such as costs are strongly connected to the reduction of financial risks more than to the costs control in a strict meaning.

Keywords: *Software as a Service (SaaS), Outsourcing, Customer Relationship Management, Transaction Cost Theory (TCT), Resource-Based View (RBV)*

INTRODUCTION

This study investigates how certain organizational, economic, and technological factors enable the adoption of software as a service (SaaS) model for customer relationship management (CRM) applications. In turn, it determines whether it is possible to specify a decision course for such adoption. In this context, CRM represents an integrated, structured process for customer management (Parvatiyar and Sheth, 2000) that uses Information and Communication Technologies (ICT) (Sawhney and Zabin, 2001) to define and develop personalized, long-term customer relationships (Payne and Ryals, 2001) and thus create competitive value and advantage for the firm (Day and Wensley, 1988). Accordingly, CRM systems require a technological infrastructure that can support their processes. The SaaS approach is a demand-driven application that provides network-based access to an integrated portfolio of applications across the virtual value chain of an enterprise (Buxmann et al., 2008). A rapidly growing

means of software licensing, SaaS differs from traditional approaches, in which the buyer purchases a perpetual use license from the software publisher and makes additional investments to obtain hardware, installation, and maintenance services. In contrast, in the SaaS model, a user buy a subscription to the software, and the software publisher runs and maintains the software on its own hardware, granting subscribers access to the software via the Internet (Xin and Levina, 2008).

We define SaaS as a service delivered according to a peculiar outsourcing procedure (Bardhan et al., 2010), such that a software vendor hosts, operates, and manages a software service for clients, on a paid subscription basis.

Therefore, SaaS can support online CRM applications through two component (Imhoff and White, 2009): applications and platform as a service (PaaS). The latter provides services that support on-demand CRM applications and itself consists of three components: CRM development, data integration, and data management services.

Referring to TCT and RBV the purpose of the present study is to understand which are the factors that drive SaaS adoption for CRM applications. In particular, the research question wants to detect the key organizational factors in the decision-making process for SaaS adoption placing emphasis on its impact on people, operative processes and services' suppliers. Moreover, the economic aspects have been investigated such as the costs and the technological aspects, which enable SaaS adoption in CRM applications.

Today's literature about that matter is very limited and the aim of this paper is to contribute to a literature enrichment in this branch of research. The objective is to try to fill the existing gap between how the world of business practice is moving towards a new organizational solutions based on peculiar types of outsourcing approaches and the academic literature which should study and theorize these models. There is a lack in literature studying SaaS adoption processes because studies are focused on traditional outsourcing themes and prior studies did not analyze the differences between ASP and SaaS (Xin, Levina 2008).

First results are highlighting the importance of some organizational factors such as the marketing processes' optimization, while other factors such as costs, are strictly connected to the reduction of financial risks more than to the cost reduction in a strict meaning. The obtained results suggest the importance of the innovative choice of SaaS on a strategic level as it turns to make CRM operative processes more efficient and reduce the time-to-market.

The paper is structured as follows: after the background literature, we present the research question. Then we describe our research method, research setting and we offer a discussion of the enablers that emerge from our case studies. Finally, we summarize our preliminary findings and comment on their organizational, economic, and technological implications.

LITERATURE REVIEW

Software as a Service is a model of software for distribution and development, which has already been present in the field of Information Technology for almost ten years.

That phenomenon aims to the substitution of the product providing concept with the service providing concept, making intangible to the user the remote place from which the application is provided and the modality through which the application itself is accessible to the final user (Xin and Levina, 2008, Bardhan et al 2010).

The Software as a Service exceeds the traditional outsourcing concept and the Application Service Provider (ASP) concept where it was the IT architecture of the supplier to be provided with a mechanism of software “customization” in favor of the client. On the contrary, in SaaS modality every personalization is done directly from the client using web based standard interfaces. The peculiarity that the applications’ supplier doesn’t make client-specific investments makes that model particularly competitive from the point of view of costs (Xin, Levina, 2008). Moreover, the possibility to support a better specificity in the investment in terms of integration easiness with the information system which has already been present in the company, makes that approach more convenient in comparison with the solutions which existed in the past. Moreover, this easiness in integration is strictly connected to the level of the client’s architecture’s maturity (Ross and Beath 2006; Xin and Levina, 2008). Sourcing strategies find their theoretical basis in different organizational theories. The present study is based on two widely used and developed theories in literature: the Resource Based View (RBV) and the Transaction Cost Theory (TCT). The choice of sourcing (SaaS) has been investigated in relation to its strategic value.

Referring to RBV and to TCT, with the present study the following research question has been put: what are the technological and economic organizational key factors to guide the SaaS adoption choice?

SaaS and RBV

In particular, the RBV theory has been adopted to investigate the impact of a SaaS approach choice on human resources working in the involved companies and on the operative CRM processes present inside the same companies (organizational factors). As a matter of fact, the Resource Based View is

based on the assumption that strategic resources are distributed among organizations in a heterogeneous way and that this characteristic is permanent in the course of time (Penrose, 1959; Wernefelt, 1984; Grant, 1991)

Therefore, the company is not a set of contracts, but it represents a “bundle of resources” (Penrose, 1959), where the resource involves all assets, skills, internal processes, attributes, information, knowledge managed by the company in order to find and implement strategies which can improve its efficiency and efficacy (Wernefelt, 1984). In other words the company’s resources, such as physical, human and organizational capital, constitute forces that can be used to complete internal theoretical approaches able to obtain distinctive performances in the company’s referred markets, in virtue of the own company’s skills to enable internal expertise producing a competitive advantage, particularly if it is sustainable.

The strategy consists in the “match” (Grant, 1991) between internal strength-weakness and external opportunities-threats, with the goal to obtain an optimal combination between these factors. The strategy formulation should include an evaluation from the management of many indicators, through a decisional path that requires (Grant, 1991): the internal resources analysis, the evaluation of companies’ skills, the analysis of potential profits, of resources and internal expertise, the selection of strategy, the extension and updating of the resources pool and skills.

SaaS and TCT

On the other hand, referring to the transactional cost theory Coase, 1937; Williamson, 1987) the organization is presented as a set of contracts and transactions, nexus of contracts (Coase, 1937), that regulates the process of resources acquisition for the support of internal activities. Under the analysis of that model there are the two structural organizational alternatives which derive from the decisional phase between the two extremes: hierarchy or market. It is the latter to be considered a form of outsourcing. For this reason the sourcing decisional phase has been analyzed focusing the attention on transactions that derive from SaaS approach. The aim is to optimize the operative processes making CRM transactions easier and more economic on one side and managing in a more efficient way the external relationships on the other. This aim requests the definition of adequate services levels (SLA).

The decisional sourcing phase has been analyzed focusing the attention on transactions that have an immediate relapse caused by the choice of SaaS approach. The aim is to investigate if and how can be achieved some improvements in terms of optimization of CRM internal operative processes. The aim is to make the internal transaction easier and more economic on one side and to manage the external

relationships in a more efficient way as it happens with every other outsourcing compared with a choice of hierarchical in-house sort. This aim requests the definition of adequate services levels (SLA).

All the suggested aspects can be analyzed through the Transaction Cost Theory most of all in regard to the more economic-quantitative aspects, therefore referring to the economic, technologic and contractual perspective relationship with the supplier.

The role of services suppliers has been investigated using control skills connected to the measurability requirement of the work flow allowed by SaaS and connecting the economies of scale from the suppliers' point of view to a cost reduction from the clients point of view that can make that sourcing model very profitable in virtue of the support in achievement of a lower total cost and therefore more convenient (production costs and transaction costs). The transaction cost theory constitutes the first approach developed and used in literature (Coase, 1937), and deepened subsequently by Williamson (1987) about the analysis of these transactions. The transaction investigated in this research has also qualitative features and therefore an analysis of the possible transactions hidden costs, produced by a more complex relationship with the supplier compared to the internal structure becomes essential.

METHODOLOGY AND METHOD

In order to answer our research question, we undertook a multiple case study of four companies during 2014. With this case study method, we can analyze data in a specific context in depth and thereby investigate a phenomenon in its natural setting (Benbasat et al., 1987) through a detailed analysis of a few events and their relationships (Yin, 1994). Furthermore, a case study offers a unique method to observe natural phenomena in the data (Yin, 1994), because unlike quantitative analysis, it considers data on a micro level (Benbasat et al., 1987; Eisenhardt, 1989). Accordingly, case study research supports the practical correspondence of phenomena, studied in their natural setting, and thereby helps answer why, what, and how questions by providing insights into the nature and complexity of those phenomena. Furthermore, a case study allows for explorative investigations when the variables are not known and the phenomena are not well understood. Finally, case studies are easily adaptable to different contexts: In both organizational-managerial and social settings, it is possible to use an investigative model that has been adequately standardized, without the risk of biasing the findings. We identify four companies in four different industrial sectors (table 1) that had adopted SaaS CRM solutions and appeared on a list of large companies in Nord Italy. For this research, we rely on observations, informal conversations, and recorded interviews. The observations and informal conversations established the reference context, prepared us for the investigation, and revealed some information to support the extension and revision of our analysis. Our respondents

were: high-level managers and vice presidents, in total we collected 20 semi-structured interviews (approximately 70 minutes in duration). The data and results obtained were presented to the main organizational actors and the board of directors of these four firms through the interview transcriptions and the interim results of the data collection phase. In this specific case, the authors used Atlas.ti Computer Assisted Qualitative Data Analysis Software (CAQDAS) to analyze the data because it enables its organization and summarizing by concept (e.g., improved collaboration, system adequacy, error reduction, etc.). Data collection commenced in November 2013 and continued for roughly six months. The analysis and integration of the existing data started in April 2014.

	ALFA	BETA	GAMMA	DELTA
Field	Chemical - textile	Liqueurs - wine-growing and wine-producing-confectionery	Metropolitan management engineering-management of the integrated water service	Job agency
Capital structure	Private capital 80% belonging to the owner family and 20% of an English fund	Private capital 100% belonging to the owner family/it is part of a holding	Ltd. company with a completely public capital	Italian company controller by a multinational group
Year of foundation	1969	1847	1955	1994
n. of employee	2000	950	1500	1700
Sales proceeds (billion €)	432	270	260.5	800
Medium growing rate of the sales proceeds in the last 2 years	20%	4%	9.9%	5%

Table 1. Some information about case studies

CASE STUDY

Case Alfa

The company was founded in 1969 and is one of the principal actors, in Italy and in the world, in the field of synthetic fiber production and in particular in the production of polyamide 6 (nylon 6). It is organized in 13 plants and one engineering enterprise. It is present in three continents and seven countries.

Problem Alfa

Because of the peculiarity of its product, the company cannot manage the final customer face to face, but it has to manage its relationship with the big brands of industries, for example in the field of automotive, or with big chains as IKEA, with the big brands in clothing which study the polymer characteristics together with their company, while the printing and the actual realization of product pieces is given in outsourcing. That means that the direct clients of the company are of a very small number, but extremely relevant, really sophisticated and demanding. Being forced to manage that kind of customer involves the impossibility to manage the CRM processes with easy instruments as EXCEL. The amount of data to be processed is really big and the kind of analysis is very advanced from the marketing point of view.

Solution Alfa

The company has adopted CRM solution provided in SAAS modality. Implementation has taken about three months and the cost has resulted to be contained according to the scheduled budget. A significant aspect has concerned the integration with other applications already present in the company which has not presented any difficulties.

The solution has been implemented in its standard format with only a few and unimportant modifications and has produced significant advantages:

- First of all the competence of the software house in the CRM field have immediately provided the expected results as the use of that instrument inside the company has brought a very important improvement in strategies. As it has collected data and information on all the needs of the market (both about the companies' old clients and new ones) and therefore the company could study in a better way the products and the client on which it should be more convenient to invest.
- Moreover all the advantages of this solution have become evident in terms of minimization of infrastructural investments and managing of costs.

Case Beta

Beta is one of the leader companies in the field of alcoholics. Among its liquors there is a particularly famous one, which is widespread in 160 countries and has almost two centuries of story. It is the "Italian liquor more drunken in the world". Moreover the company produces and commercializes brands connected with the Italian story and tradition.

Problem Beta

Even if there are not direct contacts with the final customer, it has become more and more evident the need of an instrument able to support the CRM, very operative and which could pay attention to provide more and more innovative services for the commercial area. That need derives from the fact that in consideration of the 27.000 stores of the Retail Purchasing Consortiums, which are present in Italy, the company is present in the majority of them with a constant promotional activity. Therefore the commercial cost which derive from that presence are very high. The consequence is the need of a continuous monitoring and optimization of these costs.

Solution Beta

That is due to the fact that the company has found itself into a moment of pressing control by the owners that have decided to accept this sort of solution in order to control costs, overall, the costs connected to promotions as they have increased during the last years in a more than proportional way if referred to the sales proceeds. The project has been completed in about four months and a half and the whole complexity of the system has been completely hidden to the final user. The system is adopted by the so called “key accounts” which have in charge the management of products visibility and the promotion inside the stores. The system collected the data produced internally through the feedback of the promotional activities, which are connected with the external information. This external information are, for example, data about the detection of the price on the shelf of the companies and competitors products’, data about the fulfillment of the weekly visit planning. Through the system it is therefore possible to manage and monitor all the promotional activities which take place at a national level and to define the commercial activities in a more specific way for the commercial agents as well as to define a more efficient management of the visits at the different stores which feedback can later be directly recorded through CRM.

It is interesting to notice that a key account, that means one of the final user, has cooperated during the whole phase of the application implementation. Therefore he was able to see personally the easiness of the software use avoiding that way unjustified resistances from his colleagues.

Case Gamma

The company was founded in 1955 and since then it has been leader for the planning of structures and infrastructures in its local area as well as all around the world, as its knowhow in the planning of undergrounds has been asked worldwide. From 2003 it is also trustee for the management of the integrated water service.

Problem Gamma

The company's management had expressed the need of a new CRM system as they were not satisfied with the traditional and homemade existent systems. There are several reasons, but from the chairmanship have arrived many signals for a more precise costs analysis about the commercial area. It would have been impossible to give all that information without an advanced and articulated CRM system.

Solution Gamma

The solution has been the adoption of a CRM system provided in modality "as a service" which was able to offer high performances, being the result of the great technical competence of the software house which has developed a very trustful relationship particularly during the implementation phase. Advantages have not only concerned the control of costs related to the commercial area but there have been several improvements in the whole optimization of processes in the same area.

Case Delta

The company was born in 1948, founded by two layers from the United States who realized the lack of a service which could satisfy the demand of temporarily workers. Today the group works through 4000 offices dislocated in 82 countries and it is world leader in the services for the management of human resources.

Problem Delta

On the operative level their two aspects, which characterize the present business. The major contacts with the potential workers (who are clients for CRM) which must be recorded and outlined in terms of the evolution in the relationship which develops between the company and the worker. All these data must be catalogued, stored and often they need to be recovered and analyzed as it can happen that the worker himself needs to have his data for a Work Inspectorate inspection. The management of such a big amount of data brings to a huge loss of resources both economic and of time by thee employers committed to the management of commercial relationships.

Solution Delta

Therefore the company has selected a CRM system provided in modality "as a service". The software house which was chosen by the company has been selected because of its competence in the marketing area and because of the completeness of the provided service which has turned into reduction of infrastructural investments and in the elimination of the managing costs and responsibilities impacts inside the organization. The data security is guaranteed through their saving both on magnetic and

optical disks and all that has a positive impact on the business continuity and on a potential disaster recovery.

The solution has been implemented after some customizations, which were necessary because of the peculiarity of the needed services, but it has not brought particular problems in the initial phase. This project has doubtless represented a fundamental improvement for the whole organization that has become more flexible and less exposed to delay in the hypothesis of the need of a global analysis on the clients' data concentrated in the same period. The project has been realized in about four months.

DISCUSSION AND CONCLUSIONS

The applications examined in this research present a high level of specificity and therefore they also have a significant strategic value in providing support to the different business companies areas. The aim is to guarantee an adequate service in order to make CRM processes more efficient. This last aspect represents the core of the suppliers' challenge with the aim to make the strategic value of the SaaS business reliable to activate a transparent and less virtual supply of applications allowing internal capabilities that can develop distinctive performances through a sustainable competitive advantage and to enable the internal IT architectural restructuring process. It has emerged that the development of the on-demand software takes place also thanks to the possibility to create strategic alliances and that brings to mitigate the aspects of contractual risks which are normally perceived, making the trust supplier-company stronger. Moreover, a well-considered and correct definition of SLA allows to the client organizations to be protected from technological development and business uncertainties.

The efficiency and efficacy of the answer to the IT question will also pass through the standardization of the architectural systems with the aim to guarantee the interoperability and transfer possibility from one player to the other, and from the security, considered as the integrity and protection of data, privacy, service continuity, connectivity, in order to be protected from operative risks.

Moreover, the present study wants to over go the concept of a SaaS market exclusively referable to little companies: while the planning and implementation of virtualization on a long range of the internal systems is a specific peculiarity of medium-big dimensions companies (because of the amount of investments), SaaS solution has been, in the recent past, always characterized by a bigger attention from small dimensions companies, with the aim to get a quality in IT service similar to the one obtained in big dimension companies but with more affordable costs and moreover, more controllable, avoiding at the same time investment for infrastructures. That means they have given over part of their old infrastructures making their IT department streamline.

On the contrary, the companies analyzed in this research are of big dimensions and the aim of this is to understand the real development of recent SaaS-adoption, verifying the positive attitude of big companies in reference to this sourcing model. Some researches (Kern et al, 2002) have supposed and noticed a negative connection between the dimensions of the client company and the on-demand software to get a faster and easier access to precious IT resources and skills, but this assumption nowadays does not get the value of an absolute statistic representatives (Buxmann et al, 2008). That can be explained through the fact that the sourcing model is based on the supply of a service, which includes a product. Even the underneath technology is in the phase of maturity and big dimensioned companies are more and more interested in solution of that kind, through a phase of evaluation before and of implementation afterwards.

This study, which has the aim to fill the gap still present in literature about these themes, can represent a significant source of information but cannot be inclined to such a generalization to let consider absolute the results, which have been exposed in that research on the basis of the executed data gathering. Moreover, the present study presents only a limited field of the Italian context. Nevertheless, it is possible to notice some SaaS development perspectives, which have emerged from the present work. This research has underlined the importance of costs containment in the transaction evaluation. Nonetheless, this attention to costs does not represent the main element in the decisional process for the adoption of a SaaS model.

The most critical aspects in SaaS approach have been originated in relation to a transaction-based evaluation, confirming that way the frequent intangibility of relationship which undergoes through the nets' net.

Among the crucial aspects that the supplier should consider on one side the need of transparency in the supplement and in possible dysfunction have emerged, explaining immediately the reasons and intervening in a fast way with the aim of solving the problem even on a structural level. On the other side, it has emerged the need to have some tangible points of contact with the own clients in order to be able to be warrantor for the efficiency of the offered service (less virtual), so to make convenient even bigger investments for the SaaS application in the CRM field. From the investigation it emerges that SaaS produces a company's attitude crosswise favorable to that model and moreover, thanks to the easiness in use and speed in implementation, users are supported in the continuity of their task inside the CRM operative processes. The new role, which is asked to be played from the IT team, which takes the part of the warrantor for the operative efficiency, does not represent a deterrent in the SaaS-adoption. Nevertheless, a reconversion of the personnel skills is indispensable, in order to be more oriented to processes than to technology, but they still have a very important role, if not even more

critical, as it is the role of the intermediate user-supplier, with whom he will have to cooperate. The IT team will be called to act in supporting functions, transforming their tasks from asset-oriented to process-oriented, therefore involved in the creation, support and adaptation in the intelligence of the organization whose part they are.

Concerning this aspect a positive acceptance from the users has emerged, even if they have not always been involved, to confirm the opportunity offered by SaaS-adoption to enable cooperative aspects and of systemic coordination particularly in CRM field. After the over mentioned considerations the solution to problems related with the supplier, which represent one of the future challenge of this web-based technology, will appear more and more crucial.

The study presents both limitations and new ideas for research. The security aspect has not represented the critical aspect perceived with a major weight; that is a very important element to be developed through new researches, but it can be noticed how the perceive from the point of view of the demand of that requisite is really positive, connected to the fact that the supplier is seen more and more specialized in that field in reference to the kind of delivery that it expresses. In particular, security and data protection, with the related privacy are taken into consideration as significant aspects in the decisional process but they do not appear to be a deterrent for SaaS adoption. On the contrary, it is the connectivity the most controversial aspect even if not decisive, that is considered the object of more deepener investigations, more than all regarding the supply of SaaS which includes different systems with relevant complexities and integrations.

Integration is exactly the aspect which will have business developments in parallel with technological developments: the architectural suppliers will have to create, through specific agreements, a net for SaaS supply (and not only for SaaS) which could guarantee the interoperability inside service-oriented architectures (SOA), so that they could allow to the companies which are planning investments in that field to have at their disposal environments where there are not barrier in the choice of sourcing and supplier: it is always the client organization that must have the control of its own data, while the supplier will have to guarantee the data privacy and availability.

Concerning this matter, the present study has noticed that companies are more interested in innovation to enable more and more business needs with the aim of making the time-to-market faster; the interviewed people have pointed out their interest towards change in the management of the whole IT structure if compared to the possibility of transferring in-house the future CRM application.

In the cases, which have been analyzed, the integrability has been in any case guaranteed by the fundamental support of the IT personnel, in spite of the difficult integration process.

One more element, which must be investigated, is the SLA definition, which is fundamental in one sort of outsourcing; this aspect has not been declared of easy solution, mainly in the attempt to guarantee flexibility margins for the advantage of the client company. The future development of SaaS adoption models also goes through the transparency in that field, even in virtue of the measurability services' characteristics which are enclosed in the model itself.

Moreover, it will be interesting to understand, through future researches, if the companies which have been often investigated could present a strong causality requisite through studies of a longitudinal kind that even investigate the behaviorally aspect of people during a certain amount of time, possibly making researches which include different organization stakeholders.

THRIVING IN MULTICULTURAL WORK SETTINGS

Rozkwitalska, Malgorzata¹; Basinska, A. Beata²

¹Faculty of Finance and Management, Gdansk School of Banking, GSB, Gdansk, Poland

²Faculty of Management and Economics, Gdansk University of Technology, GUT, Gdansk, Poland

ABSTRACT

Owing to globalization and the global mobility of workforce, working in multicultural environments has become a daily reality for an increasing number of manpower. Such an environment does introduce unique challenges to individuals, enabling some of them to thrive. The aim of the paper, therefore, is to explore the antecedents of thriving and its components in multicultural work settings of multinational corporations (MNCs). The in-depth interviews with 38 informants were conducted to analyze intercultural interactions in 2 MNCs' subsidiaries. The study demonstrates that those individuals who thrive in MNCs assess their specific job demands as challenges. Moreover, thriving people activate their personal resources to face their challenges, which in return enhances their learning and personal growth. The learning component of thriving appeared to be more salient than vitality.

The research may suggest that managers of MNCs should recruit employees whose need for growth is well-developed, since those individuals can benefit more from multicultural work settings and thrive. International experience and psychological capital are the additional factors here that may foster employees' thriving.

To the best of our knowledge this is the first research that explores thriving in multicultural work context. It looks at the antecedents of thriving with the Positive Organizational Scholarship lens. Nevertheless, the study is based on the qualitative methodology, which does not allow for a generalization of the findings.

Keywords: *intercultural interactions, learning, thriving, positive psychological capital, Positive Organizational Scholarship*

INTRODUCTION

Thriving is the experience of an individual's growth resulted from vitality and learning in a work context (Spreitzer *et al.*, 2012; Paterson *et al.*, 2014). The studies on thriving are becoming an important domain of inquiry and are systematically growing in number as the phenomenon produces many positive outcomes for organizations. First, thriving is a positive subjective experience that helps

employees to develop in a positive direction (Spreitzer *et al.*, 2005). Second, it is positively associated with job satisfaction and organizational commitment and negatively associated with professional burnout. Third, it plays a mediating role between organizational commitment and a career development initiative as well as organizational commitment and job performance (Porath *et al.*, 2012; Spreitzer *et al.*, 2012). Moreover, it can support human resource managers in using practices that seek to fit work environment and employees positive potential (Kira and Balkin, 2014).

Over the years researchers have concentrated on the benefits of thriving with regard to work-related outcomes. However, to date, the antecedents of thriving are considerably less recognized. There are certain calls of other researchers (e.g. Niessen *et al.*, 2012; Paterson *et al.*, 2014) that more studies are needed on how job characteristics (job demands and job resources) and personal resources foster thriving and consequently increase individual and organizational outcomes. An understanding of the role of such contextual antecedents is particularly important for managers in organizations, who are interested in promoting their employees' thriving at work. They want to know how and why their employees react to specific contextual features and utilize their personal resources.

The work landscape has considerably changed over the years. Amidst these changes, both globalization, which has led to multinational corporations (MNCs) being present in host economies worldwide, and the global mobility of workforce have made working in multicultural environments a daily reality for an increasing number of manpower (Nolan, 2012; Westover, 2012). The work context in MNCs varies from any other corporations' work context. The main difference is cultural and language diversity, which is evident in the interactions of MNCs' staff (Lauring, 2009; Tanova and Nadiri, 2010). Although such an environment poses unique challenges to individuals, since they are exposed to cultural barriers (Chen *et al.*, 2005), there may also appear opportunities (Youssef and Luthans, 2012) that enable individuals to thrive. Therefore, the aim of the paper is to explore the antecedents of thriving and its components in multicultural work settings of MNCs.

To the best of our knowledge, no research so far has explored thriving in the multicultural work context. This study, by focusing on multicultural work settings of MNCs, is likely to be the first one that responds to the aforementioned researchers' calls. It also looks at antecedents of thriving with the Positive Organizational Scholarship lens contributing to this emerging domain of inquiry.

In the following sections of the paper, we briefly review the literature on thriving and present the methodology that substantiates our research. Afterwards, the empirical findings are discussed with regard to thriving in multicultural environments of MNCs. The conclusions and discussion section draws contributions, limitations and practical implications. Directions for future research close the discourse.

LITERATURE REVIEW

Thriving in the prior studies and the research gap

Thriving is “the psychological state in which individuals experience both a sense of vitality and a sense of learning at work” (Spreitzer *et al.*, 2005, p. 538). Vitality captures the positive experience of energy and aliveness, while learning is defined as the sense that a person acquires knowledge and skills and is able to use both of them (Spreitzer *et al.*, 2005). Spreitzer *et al.* claim that both components are necessary to thrive (Spreitzer *et al.*, 2012) – namely, experiencing vitality or learning separately is not enough for an individual’s prosperity, growth and development.

The prior research on thriving at work has revealed that employees describe both vitality and learning as important elements of forward progress in self-development. Therefore, thriving reflects both the affective and cognitive component of psychological experience and combines the hedonic and eudemonic perspective of psychological functioning (Spreitzer *et al.*, 2005).

Spreitzer *et al.* (2005) point out some antecedents of thriving that have led to the formation of the concept. These are agentic behaviors such as task focus, a heedful relation and exploration, and some psychological traits and experiences, i.e. positive affectivity and resilience. Nevertheless, they were drawn from a theoretical reflection. Some early studies that have explored the antecedents of thriving applied a qualitative design. For example, Travis *et al.* (2014) have examined the effective mechanisms that facilitate positive experiences at work among childcare providers. The results of this study indicate that a climate of trust and respect as well as autonomy in decision-making are instrumental in fostering thriving. Moreover, the importance of the positive attributes of the meaning making process aimed at developing intrinsic motivation and fostering team-orientation was found conducive to thriving at work.

Only a few studies so far have scrutinized thriving in a work setting (see e.g. Niessen *et al.*, 2012; Paterson *et al.*, 2014; Porath *et al.*, 2012). Recently, a few empirical quantitative studies have been published in an organizational context, in which correlational, longitudinal and diary designs of research are applied.

The correlational study conducted by Porath *et al.* (2012) shows some antecedents of thriving, namely that thriving is positively related to positive affect, a learning goal orientation, a proactive personality and core self-evaluation in young employees. Moreover, they reveal that proactiveness is a stronger correlate of thriving than other factors and thriving is associated more with a positive affect than a negative one.

Paterson *et al.* (2014) in their longitudinal research tested thriving at work by linking it to a theoretically important personal outcome variable such as self-development, and examined its relationship with two agentic work behaviors, i.e. task-focused and heedful relating, and two antecedent variables, namely positive psychological capital (PsyCap) and organizational supportive climate. The novelty of this study was indicated by advancing the model with PsyCap - a complex, personal resource including self-efficacy, hope, optimism and resilience - components that have a synergistic effect on positive organizational behaviors (Luthans *et al.*, 2007; Luthans *et al.*, 2010). The research of Paterson *et al.* (2014) supports the findings that employees' thriving is positively related to the supervisor ratings of their self-development and is also related to job performance. Task focus and heedful relating are positively associated with thriving as well as with PsyCap and organizational supportive climate. Moreover, task focus, yet not heedful relating, mediates the relationship between two antecedents and thriving.

One of the most interesting studies that have expanded the knowledge about thriving as a dynamic state was conducted by Niessen *et al.* (2012). Their results suggest that employees who can acquire relevant knowledge and experience positive meaning at the beginning of a work day, witness better thriving when the work day ends. Thus, the daily experience of positive meaning is an important antecedent of both vitality and learning. The relationships between positive meaning, knowledge and thriving are also mediated by agentic work behaviors such as task focus and exploration. Additionally, the authors' findings show that dynamic relationships and day-to-day variability are typical of thriving. These results support theoretical assumption of the socially embedded model of thriving and that agentic behaviors can drive thriving (Spreitzer *et al.*, 2005).

Basing on the literature review, we have discovered a significant gap in the previous studies. First and foremost, more empirical studies are still needed to verify the potential antecedents of thriving in various work contexts. Moreover, the existing research has not indicated how job demands and job resources affect thriving and which of them are of vital importance. To the best of our knowledge, no research so far has explored thriving in the multicultural work context that creates peculiar job demands. It has also occurred evident that more effort is needed to explore personal

resources in the context of MNCs as the antecedents of thriving. Our research responds to these needs.

METHODOLOGY

The research method

The research took a form of a qualitative, explorative study based on information gathered primarily via semi-structured, in-depth interviewees with managers and specialists, who were involved in intercultural interactions while performing their occupational duties in subsidiaries of MNCs. We launched the data collection process in March 2014 and completed it in September of the same year.

The open-ended and flexible character of the in-depth interviews has appeared to be an appropriate method to obtain the most accurate, exact and detailed observation with regard to the participants' experience, attitudes, perceptions and opinions (Dearnley, 2005; Brenner, 2009). The method also gives an opportunity to discover new aspects of the phenomenon which may have been missed so far by other researchers (Kühlmann and Hutchings, 2010).

The series of questions that we asked during the interviews referred to the outcomes of intercultural interactions and factors enabling effective cooperation with foreigners. Nevertheless, we modified the order and the number of the questions depending on the course of each dialogue and the relevance of information obtained from the interviewees (Dearnley, 2005). The study design presumed that the duration of each interview should take 45 - 90 minutes to leave enough room for logical conclusions and a dialogue between us and the informants. On average, each interview's time duration was 63 minutes, whilst we carried out 39 hours of the interviews in total. Then we coded and analyzed the entire collected materials.

We followed the procedure of qualitative content analysis, i.e. "a research method for the subjective interpretation of the content of text data through the systematic classification process of coding and identifying themes or patterns" (Hsieh and Shannon, 2005, p. 1278). The coding schemes used in the content analysis were developed inductively from the data by a constant comparison of each interview and emerging themes (Glaser and Strauss, 1999), thus it took a form of a conventional content analysis (Hsieh and Shannon, 2005). We followed the three steps procedure of qualitative content analysis (Hassi *et al.*, 2011). As the first step, open coding was applied. We tried to reveal some common themes emerging from the interviews known as open coding (Randall and Mello, 2012). These were for instance 'interesting experiences and curiosity'. Afterwards, those categories were labeled with the higher-level concepts such as e.g. 'needs fulfilment'. The main logic behind the axial coding at this step was to classify each category according to 1) the types of difficulties witnessed in

the relationships with foreigners (e.g. the ‘communication barriers’ category was developed); 2) the types of outcomes derived from intercultural interactions (e.g. the ‘learning and vitality’ category was created); 3) conditions essential for fostering successful interactions (e.g. the ‘personality’ category was found). Finally, during the process of selecting coding some categories were combined into broader clusters and refined (Hsieh and Shannon, 2005). As a result, a theoretical scheme emerged that enabled us to discuss the findings with respect to thriving antecedents, both organizational and individual ones, and its components, i.e. learning and vitality.

The companies and participants

The subsidiaries of two MNCs (see Table 1), which could “inform the research questions being investigated” (Zhang and Wildemuth, 2009, p. 309), were selected via a purposive sampling technique that is usually used in studies that rely on qualitative content analysis (Zhang and Wildemuth, 2009). We searched for subsidiaries of MNCs in which intercultural interactions at work are a daily reality for their staff. The subsidiaries A and B met this initial criterion.

Subsidiary A	<ul style="list-style-type: none"> • belongs to a German MNC that employ above 2,300 employees worldwide, • established via a greenfield investment in 1986, • offers surface protection, scaffolding, steel construction and oil and gas offshore services, • operates on various European markets and the vast majority of its revenues are produced outside Poland, • involves its employees in intercultural interactions such as both face to face and virtual relationships with the subsidiary’s mandators or their authorized representatives, the MNC’s employees and contractors, • delivers services for foreign clients by the subsidiary’s project managers and workers on overseas assignments, yet it occasionally hires workers from other countries, • it has subsidiaries in France, Denmark and Germany.
Subsidiary B	<ul style="list-style-type: none"> • is a part of a North American multinational semiconductor manufacturer that employs above 100,000 people worldwide, • founded in 1994 as a greenfield investment and merged with a previously Scandinavian affiliate located in Poland in 1999, • works mainly as an IT-shared service center and additionally as a HR-shared service center as well as a global tax and trade shared service center, • services other subsidiaries in Europe, the Middle East and Africa, • involves its employees in intercultural interactions that are rather intense, daily, and virtual with the other employees of the MNC, including the members of geographically dispersed multicultural teams, who frequently represent culturally distant countries.

Table 1. *A brief profile of the subsidiaries in the sample*

Overall, 38 individuals involved in intercultural interactions constituted the sample in both MNCs, namely 20 subjects in subsidiary A and the remaining 18 interviewees in subsidiary B. The majority of them were specialists and the middle level managers who accounted for 42.1% and 26.3% of the sample respectively. 60.5% of the interviewees were men. There were 3 foreigners in the sample, i.e. a Dane in subsidiary A and an American and a Ukrainian in subsidiary B. People in their twenties and thirties contributed to the sample in 39.5% and 26.3% respectively. 55.3% of the study’s informants have worked in the present MNCs for less than five years. The participants represented various

organizational units, nevertheless most of them were directly employed in operations departments (18.4%), HR/administration (15.8%) or board of directors (15.8%), and R+D unit (13.2%). 71.1% of the individuals in the sample have worked and lived abroad, while 47.4% of them had professional experience gained in other MNCs, which may suggest that the respondents have had international experience (Takeuchi and Chen, 2013). It is worth emphasizing that this fact could affect their notion of intercultural interactions at work.

RESEARCH RESULTS

The organizational antecedents of thriving

The content analysis of the data revealed that the participants witnessed learning and vitality at work as a result of *specific job demands* in MNCs. The vast majority of them categorized those job characteristics as challenges rather than barriers:

The difficulties are the challenges that motivate you and bring about job satisfaction. I learn more, though frustration may arise when difficulties occur.

Working in the MNCs required from the interviewees a good command of common, *functional language*. As the analysis proved, this job requirement appeared to be the most demanding in view of the respondents' remarks and it was often seen as a barrier to their rapports with foreigners. However, an opportunity to master language skills in a daily communication was also appreciated by the majority of them. Moreover, by some of the participants the requirement was classified as a challenge rather than a barrier that, if successfully faced, contributed to their learning and professional development:

[Communication is] a challenge not a barrier, but the greatest difficulties are in this area.

In multicultural environments of the MNCs the interviewees were expected *to manage the difference* of attitudes, perspectives, views, habits, etc. under their specific job requirements, which also induced them to learn and invigorate:

I like diversity and learning. I am fond of working with foreigners. (...) There are difficulties. You have to bear in mind that others may think and behave in a different way, since they were raised in various cultures. (...) You need a wider imagination.

Learning is inclusive, among others, of *cross-cultural adjustment* and adaptation. The requirement to adjust and be flexible was an obvious consequence of cultural diversity at work in the analyzed subsidiaries:

You have to be flexible, expect unexpected, be prepared for out-of-the-box thinking about problems.

In view of the study's participants' remarks, their MNCs' work context was highly demanding and competitive. Nevertheless, the companies provided in return better *resources* than in other types of organizations, which could enable employees' adjustment and as a result facilitated tasks actualization and interpersonal rapports. These were for instance language and cross-cultural trainings, communication technology for dispersed teams, knowledge databases, core values, special initiatives, relocation and other amenities:

Our core values – we are different but we pursue the same goal. There are language courses. The company supports diversity – in case of discrimination, the consequences would be severe.

Personal resources as individual antecedents of thriving

Since work settings of MNCs are highly demanding, MNCs' staff should be equipped with unique personal resources. Thus, we asked the interviewees what, in their opinion, makes working with foreigners affluent of positive outcomes. Generally, the respondents indicated the following: personality traits, a positive attitude, skills and experience.

With respect to personality, *being open* was the most crucial feature of a person that, in view of the informants' remarks, influenced success in intercultural interactions. For instance, one of them noticed:

[A person who wants to succeed in intercultural interactions should be] open to other people, respect others and be confident of his/her competencies.

The features of curiosity and a preference for variety were also identified in the respondents' utterances:

Differences are precious and more important than initial challenges. It is interesting and gives you joy when you can interact with others.

The participants of the study frequently mentioned *a positive attitude* as another factor that may determine smooth relationships with foreigners. As symptoms of a positive attitude toward representatives of different cultures the respondents indicated not yielding to stereotypes, persevering toward goals and motivation:

Positive experiences set one's mind positively. (...) For example, you need a positive attitude toward someone's accent because you want to reach goals together.

According to the informants, being successful in addressing language and cultural diversity challenges, as specific demands of a work context in MNCs, required certain *abilities* such as speaking foreign languages or having social and technical skills:

[To be successful, you need to be able to] make contacts, speak a foreign language, present personal culture, will, commitment to goals

In view of the overall collected data, it must also be stressed that the enabling factors in intercultural interactions were a person's belief that he/she demonstrates a sufficient level of the foregoing abilities and has potential for activating required motivation, resources and course of actions, i.e. he/she feels self-efficacy and hope:

I prefer to work in a multicultural environment because I appreciate diversity (...). I feel self-confident in such an environment.

Last but not least, the interviewees considered *having international experience* as an essential condition for establishing and maintaining effective relationships with foreigners:

Since I was a child I have been travelling a lot. I have always loved international experiences. I have always wanted to discover, meet new people. I have been open and tolerant, so I don't see problems.

The thriving components in multicultural environments

As far as our research is concerned, it has occurred evident that working in a unique workplace of MNCs faced the interviewees with challenges or barriers, contributing to their perspective broadening, knowledge sharing and as a result enhanced *learning*:

Contacts always teach you something and bring something. If they are with a foreigner, then you very often learn the other country's culture and it is somewhat enrichment. The contacts with other states broaden your horizons. (...) The contacts with foreigners let you observe how they work and you learn.

As the content analysis revealed, demanding work environments in the MNCs stimulated the interviewees' growth. For instance, working with foreigners activated both the participants' and organizational creativity and innovation via overcoming rigid solutions as well as inducted their adaptability and resilience:

I personally appreciate the chance to learn from people from other places. It is a kind of reward to observe others, their talents and how they come up with a solution.

A participant of the study directly indicated that due to working in the multicultural environments of their MNCs, they satisfied their *need for growth*:

You gain personal development and cultural exchange due to contact with foreigners.

Learning languages as a natural consequence of working with foreigners was another symptom of an individual's growth that also occurred in terms of personality developments, i.e. openness and tolerance:

Work brings people closer, especially work abroad, when you have a direct contact, talk about habits etc. It increases your curiosity and then respect for the other culture, history.

Finally, the study provided evidence that in multicultural environments of MNCs the participants witnessed *different emotional states*, both positive emotions (e.g. curiosity, excitement, enthusiasm, pleasure, surprise, joy, satisfaction) and negative ones (e.g. frustration, anxiety, stress, impatience, homesickness). However, the positive emotions prevailed in the respondents' opinions and those emotions could foster their vitality:

This job isn't stress-free, yet it drives my energy, the continuous challenges you meet. I like that.

DISCUSSION AND CONCLUSIONS

Our study extends the literature on thriving and cultural diversity, since it revealed that specific job demands in the MNCs, such as the necessity to use functional language (due to multilingualism), to manage the differences (i.e. cultural diversity) and to adjust to them as well as organizational resources, can be acknowledged as the *organizational antecedents* of learning, whereas personal resources as the *individual antecedents* of vitality. Both learning and vitality facilitate individual development in MNCs. Nevertheless, in our study it is the learning component of thriving that appeared more salient than vitality.

In the subject literature, learning is perceived as a relational process "in the sense of relying on interactions between people to determine what needs improving and how to do it" (Carmeli *et al.*, 2009, p. 81). It "depends on members sharing knowledge and creating new solutions" (Carmeli *et al.*, 2009, p. 82). In our research, learning has not only contributed to one's personal growth, but also supported the organizational development due to enhanced creativity and innovation.

Our study shows that although MNCs' job demands put effort into the work process, they can be evaluated by individuals more as challenges than hindrances. The multicultural work environment appears to be highly motivating and MNCs do provide such job resources that enable coping with potential difficulties and enhance learning. Success in dealing with these challenges triggers positive

emotions, albeit within the process of cross-cultural adjustment people may experience varied feelings (Takeuchi and Chen, 2013).

To date, numerous studies have scrutinized what competence is needed to function effectively in multicultural environments (e.g. Johnson *et al.*, 2006; Panggabean *et al.*, 2013). Amidst other factors, learning was identified as a process that builds competence required for functioning in multicultural settings (Bartel-Radic, 2006). Learning is also a vital process for an individual's thriving (Spreitzer *et al.*, 2005) and it helps to acquire necessary experience (Takeuchi and Chen, 2013). In our study the respondents indicated the importance of international experience that enables them to deal with multicultural work environments. While acquiring international experience, people learn new abilities and exercise their linguistic, social and other skills, which further enhances their organizational potential.

The informants also described themselves as open, tolerant and curious individuals. Open people "utilize effective and creative solutions to manage work stressors" (You *et al.*, 2015, p. 140). The prior research also suggests that an open person more willingly interacts with representatives of other cultures and exhibits more cultural flexibility (e.g. Maertz *et al.*, 2009; Caligiuri and Tarique, 2012). Openness may therefore foster an individual's adjustment to unique work requirements in MNCs and increase his/her resilience. Furthermore, open people "have intellectual curiosity and a preference for variety" (Maertz *et al.*, 2009, p. 74). Openness is an essential antecedent of thriving (Spreitzer *et al.*, 2005).

The respondents' remarks about the factors that enable them to function in the multinational work environments demonstrate individual traits of self-efficacy, hope, optimism and resilience, i.e. PsyCap. Moreover, what appears visible is that the respondents presented a positive attitude toward cultural diversity, which in the subject literature is seen as a component of cultural competence (Johnson *et al.*, 2006). There is also evidence that an employee's positive PsyCap leads to a positive attitude (Donaldson and Ko, 2010). In our research, the aforementioned personality traits and dispositions created positive emotions, e.g. enthusiasm, excitement, joy and satisfaction, and shaped vitality.

The empirical findings indicate some *practical implications*. Our research may suggest that managers of MNCs should recruit employees whose need for growth is well-developed, since those individuals can benefit more from multicultural work settings and they will thrive. International experience and PsyCap are additional factors that may foster the employees' thriving. Moreover, more concern should be put on training employees' language, social and other skills since it may build their positive PsyCap and organizational resources.

Our study adds to the literature, since to the best of our knowledge, this is the first research that explores organizational (i.e. job demands and job resources) and individual antecedents of thriving and its components in the multicultural work context. It also looks at thriving with the Positive Organizational Scholarship lens. Nevertheless, the study has some *shortcomings*. First and foremost, the qualitative methodology applied to the research does not allow for a generalization of the findings. The sample size was limited since only the respondents from two MNCs were interviewed. However, the results indicate certain directions for *further research*. For instance, the role of positive PsyCap as a moderator in the relation between job demands and thriving should be better recognized. Moreover, a focus on job resources in future research can help to explain the role of organization in building thriving. Finally, antecedents of thriving in multicultural teams could be separately explored in future studies.

To conclude, *the organizational antecedents* such as job demands and job resources, and *the individual antecedents* such as personal disposition (positive PsyCap), international experience and skills can foster learning and vitality in MNCs. Additionally, thriving strengthens other positive individual and organizational outcomes as well as makes MNCs an attractive workplace for people seeking to thrive.

ABSTRACT

The aim of the paper is to introduce the concept of digital corporate disclosure and stimulate the scientific community to develop a fruitful debate on the measurement systems of digital disclosure. The corporate disclosure is an information process that has been argued by many authors who demonstrate, in different ways, the correlation between the disclosure and the business results. At the same time, the conceptualization provided by the literature focus on the centrality of the digital culture in our century as part of a wider phenomenon: the information culture. In this scenario, the information culture becomes the system in which the corporate disclosure and the digital culture are merging to achieve business results. Hence, our evaluation focus on the digital corporate disclosure, following the idea that companies' websites are communication vehicles that widespread information. In this sense, our goal is to formalize a model able to assess companies' websites in order to evaluate the digital disclosure level.

From the analysis of firms' websites of the sample – made by 39 firms listed in the Italian Stock Exchange and operating in the entertainment sector – we've built an evaluation pattern made by eleven indicators. In conclusion, a correlation is carried out between the results and the efficiency indicators, the intangible investments and the governance indicators, in order to verify the determinants of the digital disclosure.

Keywords: *Corporate disclosure, Digital Culture, Entertainment Industries, Italian Stock Exchange, Correlation, Investor Relation Manager, Digital Corporate Disclosure*

INTRODUCTION

In a complex environment, driven by digitalization and reputation (Cuganesan et al., 2010), the digital culture has become a critical element for firms value proposition. In facts, the last years have seen the digitalization becoming a survival need for companies, but also for other kind of organizations in noncompetitive contexts. In this direction, the paper studies companies' websites as information

vehicles (Vrontis et al., 2008), evaluable considering their communication aptitude. In this perspective, digitalization is closely related to the corporate disclosure (Gandía, 2009). Disclosure means transparency: to give an information set able to help the greatest number of stakeholders (Guthrie, et al., 2008) to make informed decisions. Consequently, when a firm carry on a corporate disclosure process, any information are widespread in the environment.

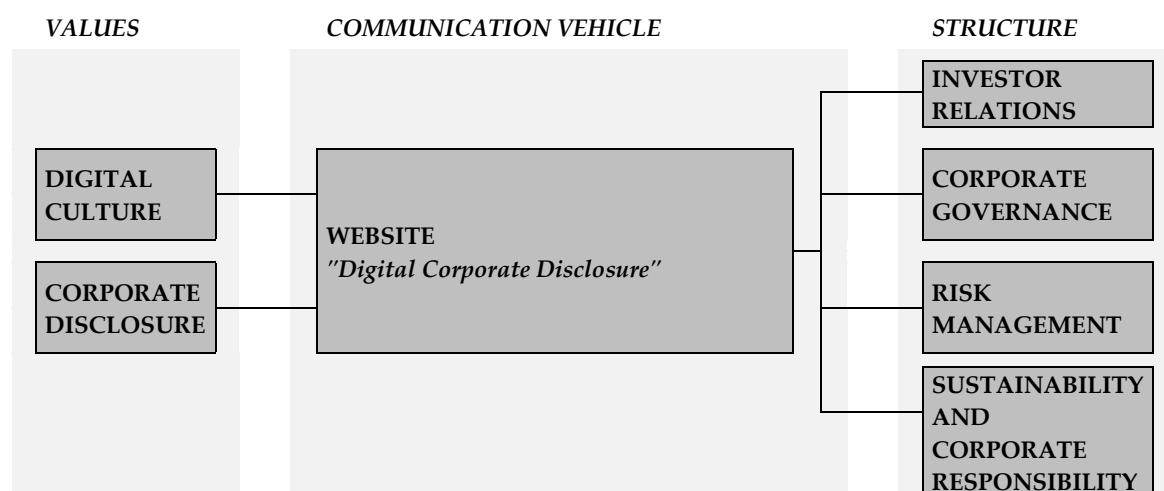

Starting from a literature review on corporate disclosure (Banghoj, et al., 2008; Dumay, Tull, 2007) and digital culture (Creeber, Martin, 2008) we investigate the digital behaviour of firms regarding their corporate disclosure. In other words, we aim to evaluate the characteristics of the “digital corporate disclosure” (Bonsón, Escobar, 2006).

Onida (1945) argued that the balance sheet can be an information instrument or a behavioural instrument; more specifically, when the external reporting it's used as information instrument the aim is to provide information to stakeholders without applying any kind of policies; when it is used as a behavioural instrument the management apply budgetary policies in order to facilitate the exposition of prefixed business goals. The same goes for websites but companies do not widespread false information on the web because they need to protect their reputation (Bromley, 1993; Cravens et al. 2003; Fombrun, Van Riel, 1997).

The literature analysis is developed on secondary sources from international literature (such as reports, newspapers, websites, articles, papers and scientific books).

The evaluation is based on the analysis of the structure of firms' websites by choosing a sample of 39 companies listed in the Italian Stock Exchange. We've built a scoring model that focuses on websites' common sections in order to evaluate the structure and contents of websites. The following figure 1 shows our evaluation process.

Figure 1 – Evaluation process

Source: Our elaboration

In order to test the model, we check the correlation between our evaluation and some company characteristics: efficiency, intangibles investments and governance indicators.

This paper is structured in six sections: after the introduction, section two analyses the literature related to the corporate disclosure and the digital culture. Section three describes the adopted research approach. Section four illustrates the research results. Section five proposes final consideration and future perspectives of this field.

The research question is the following: How the digital culture and the corporate disclosure are related? Which characteristics of firms affect the digital corporate disclosure?

LITERATURE REVIEW

Manovich (2001) introduces the concept of an information culture conceptualizing the digital culture as “part of the information culture, within media content and form, of national and cultural traditions, characters, sensibilities, as well as a mixing of culture and computers”.

In this direction, the author extends the new media theory toward an integrated perspective of “old and new” such as in the contribute on remediation by Bolter and Grusin (1999) and on the mediamorphosis by Fidler (1997).

Many other labels have been given to this concept: Lévy argues about “cyberculture” (Lévy, 2001), Castells defines it “internet culture” (Castells, 2001), Johnson speaks about “interface culture” (Johnson, 1997) and Jones talks about “virtual culture in cybersociety” (Jones, 1998).

According to the media theory, the evolution of digital culture in the worldwide previously shifted from a 19th century print culture to a 20th century electronic culture and then to a 21st century digital culture (Deuze, 2006). In facts this process regards also the corporate disclosure (Guthrie et al., 2008). Companies have been heavily impacted by the digital (r)evolution; consequently, their disclosure vehicles have been influenced.

Many authors explored the association between disclosures and firm’s cost of equity capital (Botosan, 1997; Lang, Lundholm, 1996). This evidence has been also demonstrated correlating the results of debt placement with the disclosure quality (Sengupta, 1998).

Other studies (Farragher et al., 1994; Lang, Lundholm, 1996) focused their studies on the negative association between disclosure and dispersion of security analysts’ earnings-per-share forecasts or documented a negative relation between the disclosures scores and the bid-ask spread set by the market makers (Welker, 1995). These studies demonstrate the correlation between the corporate disclosure communication process and the business results of companies (Trequattrini et al., 2012a). At the same time, the conceptualization provided by the literature focuses on the centrality of the digital culture in our century as part of a wider culture: the information culture.

In this scenario, the information culture becomes the system in which the digital corporate disclosure is growing as fusion of the digital culture and the corporate disclosure (Figure 2 – Literature analysis). Some authors (Saxton et al., 2014; Marder, 2008; Cormier et al., 2009) argued the web disclosure but mainly focusing on financial disclosure and on the effect that governance regimes have on the corporate performance web disclosure (Aerts et al., 2007).

Differently from the previous literature, the aim of the present research is to fill the gap related to the influence of the disclosure for other stakeholders as customers or suppliers.

Figure 2 – Literature analysis

Source: Our Elaboration

METHODOLOGY

The scope of the research is to evaluate the digital corporate disclosure and verify, through the application of statistic instruments, the relation with other companies' features. Hence, the research approach is based on a quantitative methodology (Hair et al., 2003).

In this direction, the first issue has been to identify an adequate sample of firms. Using Datastream Thomson Reuters database, we've extracted from the Italian Stock Exchange a sample of listed companies operating in the entertainment sector according the Thomson Reuters Business Classification (TRBC sector). Bounding the search on companies with up from 100 million \$ of net revenues, the sample is composed of 39 companies. The reason of this choice is that entertainment firms are subject to a wider population of stakeholders. Sample's features are resumed in the following figure 3.

Figure 3 – Features of the sample

ITALIAN STOCK EXCHANGE
ENTERTAINMENT SECTOR
NET REVENUES ≥ 100.000.000 \$

Source: Our Elaboration

The digital corporate disclosure is a phenomena showed by companies' websites. Consequently, we've started a review of the sample companies' websites to identify the main characteristics and the main information to consider in evaluation model. We find that companies focus on their relations with investors through websites whose structure is based on four key-points as follows:

- investor relation;
- corporate governance;
- risk management;
- sustainability and corporate responsibility.

From these key-points we've implemented the evaluation network through different indicators. Starting from the investor relations, companies' websites contain a standardized set of information. The most representative element of digital disclosure quality is given by the provision of a dedicated web site for the investor relations. In facts, many companies provide just a section in the main website. Regarding the corporate governance (Trequattrini et al., 2012b) the evaluation process is focused on different aspects: layout format, description of the governance system, information about directors and auditors, corporate governance reports. We've evaluated the provision of a dedicated website for the corporate governance. Then we've checked for information about the governance system and about directors and auditors. We've found that websites have different structures and some of them also contain a corporate governance report. The risk management is an important issue for investors. Moreover, an adequate management of risks and an adequate communication process about risks is crucial to manage the stakeholders' stress. In this direction we analyzed both the description of risks and the description of the risks management system. The fourth key-point is on sustainability and corporate responsibility. The decision (Lombardi et al., 2014) of merging these points is based on the evidence that many companies use them as synonyms. In facts it's usual to find elements of the sustainability under the corporate responsibility and vice versa. We've considered the code of ethics, information about the supervisory board, information about social commitment.

The keywords analyzed have been divided in ten indicators composing the evaluation network. The evaluation process is made by an analysis of each website, giving a score from 0 to 1 to each indicator,

as follows: 0 means that the information is not expressed; 0,5 means that the information is expressed but not clearly or not enough detailed; 1 means that the information is well expressed. The following table 1 resumes the scoring criteria.

Table 1 – Scoring criteria

ACCURACY OF THE INFORMATION	SCORE
Missing	0
Not detailed	0,5
Detailed	1

Composed in this way, the maximum achievable rate of the model is 10. Through the application of the model, we've found that the lack of some information had an heavy impact on the total grade, even if all the other information or documents were well expressed and easy accessible.

Moreover, the objective is not to evaluate just the provided information set, but also to rate the way in which companies are able to provide these information (Vrontis, Melanathiou, 2011). In the sample, there are some companies with an appreciable level of digital culture that produces positive effects on their disclosure. Some firms have websites that are particularly well-designed with an high level of accessibility. In this direction, the implementation of the evaluation model introduces the possibility to assign up to 2 points for the accessibility. It means that a company with an appreciable accessibility, even if not excellent in every indicator, can be adequately valorized, considering the feeling of the user as an indicator of the website's disclosure.

The following table 2 reports the evaluation model consisting by eleven indicators.

Table 2 – Evaluation model

			<i>Company 1</i>	<i>Company 2</i>	<i>Company n</i>

Source: Our elaboration

Using SPSS we verify the correlation between the digital corporate disclosure, represented by our grades, and other company characteristics, following three hypothesis:

1. the correlation between our evaluation and the efficiency;
2. the correlation between our evaluation and intangible investments;
3. the correlation between our evaluation and governance indicators.

In the first hypothesis the correlation will be analyzed considering the operating profits, ROE and the ratio between total assets and equity. In the second hypothesis intangibles are considered excluding goodwill. The third hypothesis will investigate the correlation of our grades with the governance looking to the age of directors, the independent directors rate and the prevision of the investor relation manager. Table 3 resumes these hypothesis.

Table 3 – Hypothesis and Indicators

HYPOTHESIS	INDICATOR
EFFICIENCY	OPERATING PROFITS
	ROE
	TOTAL ASSETS/EQUITY
INTANGIBLES INVESTMENTS	INTANGIBLE ASSETS (GOODWILL EXCLUDED)
GOVERNANCE	MEAN AGE OF DIRECTORS
	INDEPENDENT DIRECTORS RATE
	PRESENCE OF THE INVESTOR RELATION MANAGER

FINDINGS AND DISCUSSION

Companies' websites are vehicles of information that express the association between the digital culture and the corporate disclosure. In other words, the digital corporate disclosure should be analyzed and evaluated.

The most of companies analyzed in the sample obtained a grade between 7,5 and 9 (Table 2 - Results); considering that this range includes the average (7,8974), we fixed it as the medium range. The following table 4 shows the sample and companies' grades.

Table 4 –Results

COMPANY	GRADE	COMPANY	GRADE
Cyfrowy Polsat SA	8,00	Punch Taverns PLC	8,50
TVN SA	8,00	Sodexo SA	8,00
Whitbread PLC	7,50	Marston's PLC	9,50
Compass Group PLC	6,00	Technicolor SA	9,00
ITV PLC	10,50	Kabel Deutschland Holding AG	8,00
InterContinental Hotels Group PLC	8,50	Mitchells & Butlers PLC	7,00
Tui AG	8,00	Spirit Pub Company PLC	6,50
Royal Caribbean Cruises Ltd	8,50	Rank Group PLC	8,00
Thomas Cook Group plc	9,00	Sky PLC	8,50
Ladbroke's PLC	7,50	RTL Group SA	9,00
Autogrill SpA	11,00	Restaurant Group PLC	3,50
Accor SA	6,00	William Hill PLC	7,50
Carnival PLC	9,00	Metropole Television SA	7,50
Modern Times Group MTG AB	6,00	Twenty-First Century Fox Inc	10,00
Mediaset SpA	9,00	J D Wetherspoon PLC	5,00
Greene King PLC	6,00	Mandarin Oriental International Ltd	6,50
Television Francaise 1 SA	7,00	Paddy Power PLC	7,50
Gtech SpA	7,5	Enterprise Inns PLC	8,00
Twenty-First Century Fox Inc	10,00	Millennium & Copthorne Hotels PLC	6,50
Melia Hotels International SA	11,00		

Source: Our elaboration

The lowest score has been 3,5 points; hence from 3,5 to 7 we've defined the sufficient level of digital disclosure. The highest score has been 11; hence from 9,5 to 11 points we defined the high range.

In order to verify the hypothesis listed in the methodology, we correlate with IBM-SPSS our evaluations with the efficiency, the intangible assets and the governance indicators.

As showed by table 5, there are no significant correlations with the efficiency indicators.

Table 5 - Efficiency correlations

		GRADE	Operating Profit (USD)	Return On Equity	Total Assets / Equity
EFFICIENCY	Pearson	1	0,346	-0,170	0,197
	Sig. (2-tail)		0,031	0,301	0,230
	N	39	39	39	39

Source: Our elaboration with IMB - SPSS

The same goes for the intangible assets, there isn't a significant correlation between our grades and the intangible assets value. The table 6 shows this evidence.

Table 6 – Intangible assets correlation

		GRADE	Total Intangibles (Million \$)
INTANGIBLES	Pearson	1	0,202
	Sig. (2-tail)		0,218
	N	39	39

Source: Our elaboration with IMB – SPSS

Regarding the correlation with governance, there is no association of grades and mean age or between grades and the independent directors rate (Table 7).

Table 7 – Governance correlations

		GRADE	Age Average	% Independent directors
GOVERNANCE	Pearson	1	0,186	-0,001
	Sig. (2-tail)		0,257	0,994
	N	39	39	39

Source: Our elaboration with IMB - SPSS

What seems to be related with the above grades is the provision of the investor relation manager. According to the evaluation, companies that implement their board with this professional reach highest rates in the proposed evaluation model (Table 8).

Table 8 – Grade Average

COMPANIES	n°	AVERAGE
COMPANIES WITHOUT INVESTOR RELATION MANAGER	19	7,34
COMPANIES WITH INVESTOR RELATION MANAGER	20	8,25

CONCLUSIONS, LIMITATIONS AND FUTURE PERSPECTIVES

The paper aims to evaluate the digital corporate disclosure (Guthrie et al., 2008) through a quantitative research approach. The assumption is that in companies' websites the corporate disclosure and the digital culture merge in the same information vehicle.

The literature review demonstrate that the digital culture is part of the information culture. At the same time, the corporate disclosure is a process in which the information are widespread. Many authors (Botosan, 1997; Lang, Lundholm, 1996) explored the association between disclosures and firm's cost of equity capital or the negative association between the disclosure and the dispersion of

security analysts' earnings-per-share forecasts. Other authors (Farragher et al., 1994; Lang, Lundholm, 1996) documented a negative relation between the disclosures scores and the bid-ask spread set by the market makers. In different ways, it has been demonstrated that the corporate disclosure information process is able to influence the business results.

Starting from the literature gap, we've identified an adequate sample of firms to analyze their websites and to verify their digital corporate disclosure. The evaluation model is made by ten indicators that focus on investor relations, corporate governance, risk management, sustainability and corporate responsibility. In order to consider also the general accessibility of the disclosure, we introduced the possibility to assign up to two premium points.

From the application of the evaluation model, the digital disclosure of firms in the sample has different quality levels. Considering that more than the 50% of the sample is concentrated in a narrow range of score (from 7,5 points to 9 points) we've defined the low and the high range (Figure 4 – Digital disclosure ranges).

Source – Our elaboration

Figure 4 – Digital disclosure ranges

In order to test the significance of the analysis we've checked the association between the assigned grades and other company characteristics.

Correlating the evaluation with the efficiency, the intangible assets and the governance, there is an important correlation with the investor relation manager. More specifically, companies that have an investor relation manager in their board are able to reach a better digital disclosure level. Consequently, the analysis demonstrates that in the sample the digital disclosure does not depend on the efficiency or on intangible investment, but is related to the governance.

This work aims to stimulate the scientific community to move in the direction of measuring the digital disclosure as fusion of digital culture and corporate disclosure.

In this direction, we had set up a model to evaluate the digital disclosure quality and analyze the evidences. Results from the sample demonstrate that firms have different levels of digital disclosure, at the same time firms that hold an investor relation manager have an higher disclosure level.

However, the model proposed has some limitations, there is still an arbitrariness problem that concerns both the choice of elements to analyze, than the evaluation criteria. Regarding elements, companies have similar structures that focus on their relation with investors; consequently, the evaluation structure is divided in four key-points applicable to the sample: investor relation, corporate

governance, risk management, sustainability and corporate responsibility. This choice depends on the fact that these key-points occur systematically in our sample. Nevertheless, it's possible that other researchers would find other key-points, or that the network wouldn't work on other samples.

At the same time the evaluation criterion may change by the researcher's point of view. The model consists in scoring the websites looking to the quality and the accessibility of the information; it means that the evaluation can be affected from personal skills, culture and other characteristics of the evaluator.

OUTCOME-ORIENTED PERFORMANCE MANAGEMENT SYSTEMS AND PUBLIC VALUE. FROM THEORY TO PRACTICE

Russo, Salvatore

Department of Management, Ca' Foscari University Venice, Italy

ABSTRACT

In the various theoretical streams, considerations on how the creation of PV can be measured and assessed have as yet to be formulated. This paper focuses on how performance management can be readdressed to the creation and measurement of PV. To this aim it seems important to proceed in the following ways: 1) to analyse the evolution of performance management and its extensive interpretation; 2) to understand the degree of attention paid from PV theory to the performance; 3) to establish a reference framework in which performance management becomes supportive and/or complementary to PV.

1. INTRODUCTION

Emphasis on the economic and management vision of the public sector has raised a series of questions which have led to new theoretical elaborations aimed at finding an alternative proposal in the study of public management. Moore's (1995) conceptual framework, for instance, proposed a meaning of Public Value (PV) that placed it above the formal notion of public interest. PV theory "may be attributed to a need for correcting and advancing New Public Management (NPM) concepts" (Meynhardt, 1999:194) and public value management by Stoker (2006) may be considered as "a successor of NPM" (Alford and Hughes, 2008:137).

In the various theoretical streams, considerations on how the creation of PV can be measured and assessed have as yet to be formulated. This paper focuses on how performance management can be readdressed to the creation and measurement of PV. To this aim it seems important to proceed in the following ways: 1) to analyse the evolution of performance management and its extensive interpretation; 2) to understand the degree of attention paid from PV theory to the performance; 3) to establish a reference framework in which performance management becomes supportive and/or complementary to PV.

Due to a growing number of subsequent interpretations PV theory allows us to include several aspects of performance management. The original idea of Moore's theory (1995), and others later (Cole and Parston, 2006; Stoker, 2006; Alford and O'Flynn, 2009; Benington and Moore, 2011) is that the creation of PV depends on the complexity of interdependent processes that together constitute a strategic triangle. PV is defined, legitimized and emphasized for all stakeholders and consolidated in its

operational capacity. PV can be created and measured following multiple modalities. In fact, according to a holistic view, it must be extended to all types of intervention undertaken by public authorities/agencies and its measurement has to consider not only that created from public entities but also the co-creation derived from partners and co-producers. The use of performance management tools appears to be suitable for public value measurement, though with necessary adaptations.

Section 2 explores the background to the theoretical strand of PV, with an emphasis on the role of performance management in the NPM, its potentialities and constraints. Section 3 analyses the performance management model, as a tool with several points of contact with the stream of the PV. Section 4 proposes a new interpretation of the Moore's strategic triangle, as a result of logical and interdependent processes between performance management and PV theory. In the conclusions we summarize our core findings and discuss the performance management as power element in the development of PV theory.

2. BACKGROUND TO PV THEORY

Managerialism and performance

In the public sector, a transition has been observed from the traditional model - based on the execution of procedural rules - to the managerial model, which focuses on public managers' new role and results (Hood, 1991; Osborne and Gaemblers, 1992; Broadbent and Guthrie, 1992). The traditional model is characterized by bureaucracy, inflexibility and a lack of responsiveness and inefficiency due to a focus on procedures rather than results and outcomes (Alford and Hughes, 2008: 134). There were two steps in this process of transformation into managerialism.

In managerialism there was an increased emphasis on decentralization in public sector organizations, with a consequent assignment of responsibility to divisional managers on the basis of budgeting and financial reporting similar to that used as in private business. In contractualism, the principle idea was not only decentralization, but also the separation of service delivery functions from policy making through the establishment of competition mechanisms between providers (Blaug et al., 2006; Alford and Hughes, 2008).

Throughout the implementation of managerialism the three *Es* (i.e. Economy, Efficiency and Effectiveness) are of vital importance in constructing indicators, ratios and measures to monitor how an organization converts inputs into outputs, or whether it is getting outputs and outcome (Brignall and Modell, 2000; Modell, 2004). Economy has been described as the result of the interaction of an input-oriented view, usually expressed in terms of costs, budgets, and staffing totals and an output-oriented perspective. This can aid in verifying whether the same number of inputs can lead an organization to produce a greater quantity of outputs. The reference of inputs to both costs and value

of cost-reduction activities represent the first approach of measurement to emphasize a hierarchical accountability for inputs (Romzek, 1998; Heinrich, 2002).

Efficiency is a ratio between inputs and outputs whilst effectiveness represents the achievement of objectives and results. According to Pollit and Summa (1999:9), “an assessment of effectiveness demands an investigation of outcomes, and outcomes which, by definition, take place in the world beyond the organization or programme”. This concerns the extent to which outputs meet organizational needs and requirements (Kristensen et al., 2002). The term outcome denotes “the essentially intangible, multidimensional attributes which are of real concern, relative to stakeholder needs in the public sector” (Boland and Fowler, 2000:427).

Performance has been viewed as a multidimensional concept, where the need of measurement may differ depending on the context of application, the different factors involved and the reference groups (professionals, administrators, employees). It may be related to processes, behaviors (how managers work), and results (what an organization produces and for whose benefit) (Otley, 1999). In general, reference to the performance cannot ignore an assessment of both the internal factors influencing behaviour, as well as external factors influencing the operations of an organization. In essence, the predominant matter is not only what individuals and organizations do and are capable of doing, but also the importance of their role within an organization and the conditions in which they operate (Mwita, 2000). Another perspective is concerned with the use of performance information. Usually the use of the performance information depends on the motivations of potential users and the effective utility to their goals and purposes (Van Dooren and Van De Walle, 2008).

The development of performance measurement is central to the managerialization process in the public sector. The term “performance management” was not utilized in literature until the 1970s (Boland and Fowler, 2000; Armstrong and Baron, 2005). During the 1980s and 1990s usage became widespread, despite Heinrich (2002:712) claiming that *“the plethora of idioms and acronyms for PM initiatives — planning, programming and budgeting, performance-based budgeting, pay-for-performance, performance planning, total organizational performance system, management by objectives, and more — impede a facile understanding of how and why we measure public sector performance”*.

In the early 1990s, NPM actively emphasized the need for performance measurement (Bouckaert & Van Dooren, 2003). However the idea of measuring government performance has a long history. The performance measurement movement within public services has been in part justified as an increase in accountability and participation (Talbot, 2005). The popularity or “myth” of this means of management innovation in public administration has different explanations mainly including (Heinrich, 2002; Noordegraaf and Abma, 2003; Modell, 2004):

- a need to introduce strict forms of financial control;

- the emulation of business-like models;
- a greater focus transparency in Public Administration by strengthening a performance-oriented information system;
- the need to enhance the effectiveness of public authorities;
- the implementation of result-based evaluations;
- affirming of a veritable professional accountability.

Performance measurement's primary function is to specify broad and abstract goals and missions to enable evaluation (Wang & Berman, 2001) and a performance management system needs to be purposeful, unified, integrated and fluid (Tarr, 2004). While performance measurement relates to quantifying, inputs, processes and outputs, performance management, instead, is action, based on performance measures and reporting, which results in improving behavior, motivation and processes and promotes innovation. Furthermore, there is a movement aimed to define PM as a system about both measurement and management (Hatry, 1999; Morley et al. 2001, Bouckaert & Van Dooren, 2003). Therefore, performance management takes the form of management that permeates the decision-making process, affecting operational processes, allowing for result assessment and, finally, supporting the process of external information for stakeholders. The typologies and models are classified in different frameworks for comparative analysis (Christensen and Laegreid, 2001), but essentially the analysis of PM concentrates on two forms: the specification of its components and their adaptations within different countries (Bouckaert and Halligan, 2006:6).

A detailed OECD report (1997:7) about PM practices in ten countries, indicates "PM" as "a key factor in public sector reforms", and analyses the different objectives, approaches, institutional arrangements and performance information systems, as "the major elements in PM". The report specifies three main motivations for introducing PM (OECD, 1997:9). First, the desire for improvement in internal functioning resulting in an objective of continuous improvement in performance. Second, to provide new ways of interacting with partners in the societal network resulting in an objective to improve mechanisms to distribute and clarify responsibilities and control. Third, the need for fiscal restraint (or reduction) resulting in an objective to realize savings by shrinking activities and budgets and increasing efficiency gains.

For these reasons in developed nations we have seen a high propensity in "performance oriented management" but in different manners (Pollitt and Bouckaert, 2004; Radnor and McGuire, 2003). The emergent idea is that different ways of applying performance management vary widely in their orientation to outcomes as opposed to both output and outcome (Kristensen et al., 2002, Guthrie and English, 1997). On the basis of the context of application Bouckaert and Halligan (2008:74) distinguished between three *ideal types* of performance application: performance administration

(France Germany), management of performance (Netherlands, Sweeden) and performance management (Australia, Canada, New Zeland, UK, USA).

3. PERFORMANCE MANAGEMENT IN THE PUBLIC SECTOR

How performance management works in a policy context

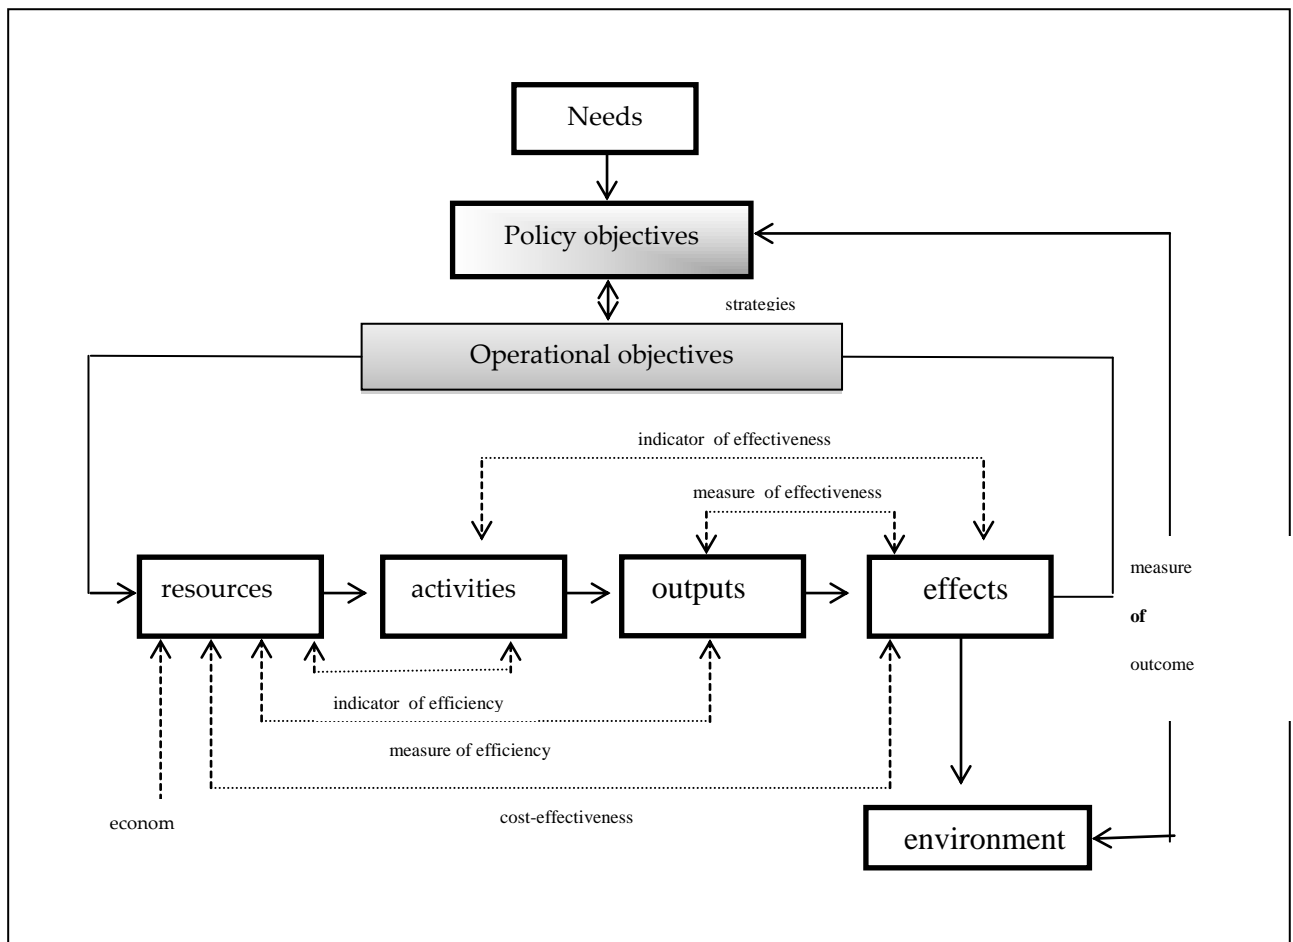

To better understand “what” and “how” to measure, it seems useful to employ a model (Boukaert and Halligan 2006:17) according to which performance management works. It shows the dynamics between policies, intended as a tool for the elaboration of needs, and operational processes, in which both the activities and results of public administration are concentrated.

The relationship among inputs-throughputs-outputs-effects allow us to understand “in a context of general and operational needs and embedded policy objectives that are interacting with environments”. Another insight from this scheme is the individualization of “who is accountable for that performance”.

Examining figure 1, we can observe that the output approach has several limitations. First, an emphasis on quantitative output measures can distort the attention of delivery agencies, so that agencies tend to lose sight of the impact their programmes have on society. Second, politicians and the general public tend to think in terms of outcomes and not of outputs. An accountability mismatch could arise between politicians thinking in terms of outcomes and agency managers administering in terms of outputs. Third, outputs typically do not forge a strong link between government policies (whose purpose is likely to be phrased in terms of outcomes) and their implementation.

Performance management works in two areas at the same time. The first concerns the policy objectives to be related to society needs and should be assessed in the mid-term to verify their impact on the environment. The second one is firmly operational, depending on which activities and processes lead to the implementation of policies and strategies. For each of these areas, it would be appropriate to construct both internal indicators, dedicated to measuring the economy, efficiency and effectiveness, and apposite indicators to measure the impact (and therefore the outcome). A matter of perspective concerns the consistency of the internal objectives (and indicators for monitoring the activity of managers and staff) with policies, while also providing a path for the stakeholder engagement.

Figure 1- Performance management in a policy context

Source: From Boukaert and Halligan (2006: 17)

According to a systemic perspective, elements to be considered for performance management are strategy, process, people and systems and their interdependent relationships (Radnor and McGuire, 2003). By using a delineation of Kristensen et al. (2002:10) "Outcomes are the impacts on, or the consequences for, the community from the outputs or activities of the government. Outcomes reflect the intended and unintended results from government actions and provide the rationale for government interventions".

The advantages of performance management applied to the public sector are of obvious systemic importance, in considering the requirement of public organizations to link the activities performed by managers to the results achieved. Further, an evaluation of performance management in the public sector has to consider some possible pitfalls widely discussed in literature. In this sense, since its introduction, the debate highlights the paradoxes of performance management. These issues were the result of wrong assumptions underlying measurement, measurement errors, and problems concerning the content, position, and amount of measures" (Van Thiel and Leew, 2002). In this study, these authors address the "unintended" effects of the performance systems and further examine the difficulties highlighted by other academics such as Bouckaert and Balk (1991), Smith (1995),

Schmidtlein (1999), exhibiting an overview of tangible difficulties shared in this paper. Among these, “the proliferation of regulators and auditors that has increased the monitoring costs of the organizations and the state”, “effects such as ossification, a lack of innovation, tunnel vision, and suboptimization” due to increased measure pressure, a trend towards “symbolic behavior” so that “monitoring appears to be in place but is in fact not”, an unclearness about “what is actually measured”, myopia “when, for whatever reason, managers focus their efforts on short-term targets at the expense of longer-term objectives”, measure fixation “when outcomes are difficult to measure there is a natural tendency to use performance indicators based on measurable outputs”. It is therefore clear that performance management, taking into consideration the role the public sector plays in the economic and social system, is likely to slip into rituality. Such paradoxes are likely to occur whenever performance management implementation fails to integrate the roles of public agencies, strategic development, internal processes, goals and outcomes (Van Thiel & Leeuw, 2002). Other studies show that performance management in public sector is more a fiction than a concrete fact (Radnor & McGuire, 2003).

Performance perspective in the public value theory

In compliance with public value theory, public managers must manage operational processes taking into account both the desires and aspirations of the community (Moore, 1995).

PV is a means and end at the same time, so it does not belong only to public administration, even though these last are suited to its creation. Alford and Hughes (2008:131) state that “should it be understood that value is not public by virtue of being delivered by the public sector. In fact, it can be produced by government organizations, private firms, non-profit or voluntary organizations, service users, or various other entities”.

PV should refer to those who consume it as well as the community i.e. the public as a whole. Consequently it contains within itself all the features related to its economic, legal, ethical and social dimension. In order to embed this in the public sector, we need to look at the “benefits created and resources expended by public organizations in generating those benefits”. Through this perspective, the PV doesn’t set aside the traditional view of bureaucratic public administration but reiterates its significance in view of the fact that anyone who has an interest in the public matters expects that such interest be pursued. “PV is what the public values” (Talbot, 2006:7). In considering this multidimensional view, a second position becomes relevant, if we look at the most pervasive concept of “public sphere” as a “democratic space which includes, but is not co-terminus with, the state within which citizens address their collective concerns, and where individual liberties have to be protected” (Benington, 2009:233). On the one hand, to the extent of PV creation, we need to ask *how* the public and the community usually evaluate both the activities and results of the public sector

compared to the needs and aspirations expressed; on the other hand it is necessary for the public sector to be asked how what it is doing will have an impact on the community and future generations, raising the issue of sustainability with regard to the PV created.

The PV theory arises in the context of a critical review of NPM contents, by emphasizing an ethical dimension and a very different concept of legitimacy and accountability.

It requires one to remain on both crucial aspects (i.e. processes and results). Creating PV means focusing on needs to be satisfied, strategies to implement to satisfy the selected needs, the activities by which processes are developing, especially in public services where there is a co-production between producer and consumer (e.g., health and education) (Spano, 2009). Furthermore, it implies paying attention to the results which add value. This explains why both politicians and public managers need to have a strong awareness of creating PV in terms of accountability. In this regard the typical tools of performance management can be extremely useful in creating and measuring PV.

The importance of the necessary steps for the public value creation may actually recognize the logic of the performance management as a real operational support. Nevertheless it is important, redesigning the relations between politicians and manager. In the PV conception, politicians must assign objectives to managers, according to a vision by which managers must become accountable for their achievement. "Public value production process requires a systemic vision of institutional, political and corporate dimensions and management control systems"(Spano, 2009: 343)

As Talbot (2008) claims, three facets of performance seem to be relevant for public agencies: 1) delivering actual services; 2) achieving social outcomes; 3) maintaining trust and legitimacy.

The creation of PV depends on the complexity of three interdependent processes that together constitute the strategic triangle through which the PV is defined, legitimated and emphasized for all stakeholders in order to foresee outcomes, at the strategic level, and consolidate the operational capacity. PV can be created following multiple modalities. In fact, according to a holistic view, it has to be extended to all the types of intervention undertaken by public authorities/agencies. Consequently, any regulations, laws, measures, activities, that may be taken upon the public sphere are susceptible of creating PV (Kelly et al. 2002). The search for PV must include not only service provision, but has to assume a deliberative attitude to create PV in the decision making phase. The latter, however, does not admit direct or immediate verification, as happens with customer satisfaction. PV can only be inferred from more complex analyses aimed at measuring the real improvement of citizens' quality of life, from its creation, i.e. the outcome generated by public decision and action.

Substantially, the PV theory focuses on the role that public managers should have within public administration and its evolutionary interpretations, although evident difficulties have emerged in its possible adaptation to different systems of government (Gains and Stoker, 2009).

Public value management

In the evolution of PV theory particular relevance has been given to the ethical dimension with reference to the effects that the adoption of “PV thinking” can trigger on management. For that reason, the “label” Public Value Management (PVM) has become widely accepted (Stoker, 2006; O'Flynn, 2007; Gains and Stoker, 2009; Alford & O'Flynn 2009; Grant & Fisher, 2010). Moore's model implies a proactive role for public servants in recognizing the political line, mediating it and enabling public responsiveness. This model stretches traditional notions of accountability for both politicians and public managers. The literature reveals a diffuse consciousness, about the difficulties in the PV framework implementation, despite its normative appeal, especially in those forms of government in which the relationship between politics and bureaucracy is overstressed.

PV theory postulates public managers as skilled mediators between politicians and citizens. The creation of PV needs to be assessed through collective democratic processes and dialogue between citizens, politicians and managers about *what is provided* and *at what cost*. Recognizing the PV requires a political engagement and an interaction between stakeholders and government officials at all stages in the policy process (Gains and Stoker, 2009). Therefore the application of the PV theory intrinsically assumes a performance-oriented organization.

In her comparative analysis of the PVM and NPM, O' Flynn (2007:361) singles out a bundle of targets to the “performance objective” component; this bundle contemplates service outputs, satisfaction, outcome, trust and legitimacy. Obviously this impacts on the accountability relationships, which are undertaken in the PV model involving *citizens/overseers of government, customers/users and taxpayers/funders*.

Within this framework, legitimacy is pursued in and out of the political process. Accountability can be delivered through performance and financial management objective setting and targets, through greater information and transparency as well as through dialogue with all the actors.

The PV paradigm can contribute mainly in two ways to strengthen the performance management. The first is the re-orientation of performance management through a shift of attention onto the outcomes within the performance system variables. Although consciousness about outcomes has long been established within the performance movement, practice frequently tends to incline to a narrower focalization on mere efficiency (as seen before, commenting on the NPM). PVM can help to transcend this limitation. A *performance culture* is one of the fundamentals “to ensure a sustainable service culture and continuous improvement” for a new public service ethos (Stoker, 2006:48). The second one is the introduction of a broader concept of outcome, within both the decision-making processes and the performance measures. This concept encompasses the impact of the public action on the citizens or the community, while the traditional concept was focused on the impact on the users.

Following this path, performance management can be enriched of elements and values that make the whole process consistent with “what states” the public value management. That implies that, once PV has been understood and created, it can be also measured. In some holistic vision, PV represents the objective to pursue, as postulated in the model proposed by Kelly, Mulgan and Muers (2002), where PV is the total amount of “benefits flow from government action”. In this perspective, managing public sector according to PV orientation means to steer public agencies by acknowledging the proactive role of public managers in PV creation. With further evaluation, the label public value management “could be considered a more complex tool for assessing the total value of government services” (Kelly et al. 2001:1). Another interpretation comes from Cole & Parston (2006), when introducing the Public Service Value Model, but their contribution is focused on a mere recovering of the tools used by performance management. “They appear to have attached the words ‘public’ and ‘value’ to a standard framework for measuring outcomes and cost-effectiveness” (Alford and O’Flynn, 2008:10). Since the method proposed by Moore doesn’t adhere to conventional performance measurement, it is necessary to go forward and analyze the proposals aimed to give shape to PVM. “The concept of PV highlights the importance of focusing on processes and outcomes (‘what value is being added to the public sphere, by whom and how?) not just for inputs and outputs, or on input/output ratios and productivity” (Benington, 2011:47; see also Williams & Shearer, 2011).

In a heuristic perspective it could be useful to articulate the indispensable steps for a successful performance management system in the backdrop of the PV theory. This means that performance management can be used for the purposes of PV theory. The PVM paradigm is focused on creating value and to transfuse PV thinking into strategies to be implemented, by distinguishing policy areas requiring interventions in different processes. In this perspective, it’s noticeable the importance of the co-product value has been highlighted and, consequently, the involvement of both citizens and institutions in delivering public service. A PV orientation should not only be observed in public administration activities, but within those organizations where it is linked to “increased levels of engagement and civic participation” (Williams and Shearer, 201:9).

4. PV AS A TRANSFORMER OF PERFORMANCE MANAGEMENT

In a very appealing lecture, Moore (2006:93), when specifically treating the issue of performance through a comparison with private businesses, pays specific attention to three main issues:

- the reasons for performance measurement in the public sector (*Why should a public manager measure performance?*);
- the focus points of measurement (*Where, along the ‘value chain,’ is it best to measure performance inputs, processes, outputs or outcomes?*);

- the role customer satisfaction plays in PV (*Should we measure customer satisfaction as an important dimension of PV creation, and, if so, who are the customers and what do they want?*)

The answer to the first question consists of the identification of performance measurement as the process of defining and recognizing PV production, so that the strategic triangle may be used as “a highly effective, even essential, tool for strategic management” (Moore, 2006:98). Every point of the strategic triangle (Legitimizing and authorizing environment, Operational capacity, Outcome/Public value) all the actors are involved in a massive process of accountability, internal and external. For this purpose “developing concrete methods of measuring specific aspects of performance” is considered as essential (Moore, 2006:98).

The PV chain provides the answer to the second question; it deploys a whole sequence of activities, processes, procedures, and programs which produce outputs and generate outcomes. Furthermore, it adds emphasis on both social outcomes and the action of partners and co-producers. The scheme is inspired by components observable also in the performance management scheme (fig. 1). The input-output components aim to monitor operational capacity, by taking into account the consequent interactions with partners and co-producers of public services. Public authorities are supposed to undertake policies and actions in a legitimizing environment where they can pursue PV. In addition particular attention is paid to citizens in a logic of customer satisfaction. This offers a satisfactory explanation to the third question where citizens are seen as different from mere users: Moore (2006:106) argues “government has clients on one hand and citizens on the other”. So government’s clients are the “citizens of the democracy who authorize and pay for the organizations and hope that the organizations will realize through their operations the aggregate social results that citizens want to achieve”.

This claim is supported by Alford’s explanation (2011) on the different role of the client of public administration, distinguishing between who pays for a public service and who is just a beneficiary. So the core of this relationship is in the behavior that public administration must “elicit from the clients which co-produce value for the public” in order to understand and respect their needs (Alford, 2011). This distinction is an interpretive lens to ensure some level of customer satisfaction but also to produce any necessary change to achieve desired outcomes.

Moreover, it is intuitive to observe the tendency of PV to encompass performance management tools in building a logical pattern, achievable through developing the three corner stones in Moore’s strategic triangle.

If we compare the determinants of PV to the canonical steps of performance management, by extending our vision to a sort of pluralization of PV, we could acknowledge an advantageous interaction between the PV paradigm and performance management. The communication area, where

PV is reported to the citizens, integrates the structure. This means that politicians and managers have to establish a virtuous circle in three actions. The first concerns the definition of rules, policy and strategy by implementing a performance management system to deliver PV. The second envisages constant attention to monitoring processes and managing internal performance. Finally, the third aims at measuring PV to communicate it to citizens. In such a context performance evaluation is just a preliminary step in creating and measuring PV. In this perspective Talbot (2010) refers to a multidimensional performance model taking multiple variables into account in order to give concreteness to a PV measurement model. Key values are identified as solidarity, equality, equity, authority and autonomy. In this way he shows how these values are multiple and often conflicting (such that it is often more appropriate to talk of PVs rather than PV) and how the process of PV creation works. In conclusion, he proposes a model to shape public performance, where the competing PVs are integrated within the performance realm (involving many actors such as citizens, partners etc.) and the performance model.

On the one hand, performance management should aim at highlighting efficiency and productivity, and on the other it should measure the value created for the community and citizens in their different expressions. In this sense, performance management becomes an instrument of both legitimacy and the assertion of PV. Faced with the services expected by the community, public administration should be able to activate a number of mechanisms to ensure the most efficient use of resources and the maximum satisfaction from users. In this way the politicians can provide a motivation about their own role and “authorization”, while public managers should be able to demonstrate a certain ability in operating for the benefits of citizens.

Figure 2: The strategic triangle in the performance management perspective

An interpretive proposal of the strategic triangle

The diagram represents a proposed integration of Moore's PV paradigm (1995) and the performance management system. It aligns the main components of performance management (*Policy, Internal process, Evaluation*) with the three dimensions of the strategic triangle where the same public managers play an intermediate role and are held accountable to citizens. Along with the authorizing environment, it aligns the system where rules, policies and strategies are developed. The internal processes are connected to the operational capacity where both organizational and individual performance need to be measured and monitored. Finally, we observe that the determination of the outcome has to be connected to performance reporting understood as a tool for measurement and evaluation. If we look at the pattern in which the two triangles overlap, we note that each of the three items of the strategic triangle can match the main components of performance management with an extensive interpretation. This vision needs at least three prepositions:

1. PV creation must be supported by both the political and the managerial dimension. The former acts by defining rules and policies, the second by aligning strategies to policies;
2. Strengthening operational capacity should be based on the adoption of management tools capable of making the connection consistent top-down and bottom-up, organizational goals with individual goals;
3. Measurement and evaluation processes must take into account both internal organizational needs and impact on citizens.

This means that since a policy is designed to meet the needs of the community and be implemented by

suitable strategies, Public Authorities should be aware of creating PV, by communicating with stakeholders, and addressing the management towards the achievement of results. Essential for the decision making process is the effort to balance the three forces focusing on the creation and measurement of PV: public interest, self-interest and procedural interest. Public value potentially captures all three of these—self-interest, public or social interest and procedural interest—in a single framework. Public value theoretically is capable to establish a contact between the political dimension and performance orientation “through its emphasis on legitimacy and trust, re-establishing the idea that in a democratic polity it is not just individual benefits from services or outcomes, or public interest benefits, but also the procedures by which they are shaped and decided upon which determine the utility of public services performance” (Talbot, 2011: 30). The subsequent actions should also be made consistent through an external reporting system with reference to overall performance including public value.

5. CONCLUSIONS

The underlying idea of this paper concerns “how” the performance management system is consistent with the creation and measurement of public value. In this sense, the paper has examined the theme of public sector managerialization, from new public management to public value management.

This has enabled the implementation of performance management systems with special attention to the different phases, underlining the connection among strategies, dynamics of internal processes and outcomes. Within the same evolution of performance management, the shift of attention from output to outcome seems central in explaining how PV theory can be combined with performance management. In a systemic vision attention has to be paid to the outcome, which represents a fundamental step in the connection with public value theory.

Considering outcomes from the perspective of public value creation means paying attention to the role of decision makers on a political level, and, in operational terms to the role played by managers with respect to citizen’s expectations. The operational tools of performance management can certainly help to measure the public value created taking into account the following internal and external factors:

- ⊗ the public managers’ awareness of public value;
- ⊗ the efficiency of internal processes;
- ⊗ the consistent implementation of policies and the achievement of goals;
- ⊗ the quantity and quality of services delivered;
- ⊗ customer satisfaction;
- ⊗ the level of legitimacy and consensus;

© results and value created over time.

Public value has the ability to integrate all instruments of performance management. The creation of public value is the result of processes that validate the operational capacity and provide support to forms of legitimacy and the environment in which they develop, legitimizing and authorizing relationships.

The main idea is to interpret PM as a supportive system in the enrichment of the paradigm of PV, so it is not unrealistic to think that it should be seen as compatible with the aspects outlined in Moore's strategic triangle.

The limits of the paper derive from a lack of empirical demonstration given that the same concept of public value while embedded in the vision of public agencies is often hindered by excessive focus on internal/organizational performance. Public Organizations which have introduced performance management systems are usually more concentrated on internal impact in terms of its organizational and individual performance. Finalizing the implementation of performance management systems, as a means of creating public value, could give meaning to public management and its benefits for the community.

ABSTRACT

The paper describes the possibilities of SEM (structural equation modelling) in the context of the tourism destination quality evaluation process; SEM was specifically used to verify the research results gained by means of the principal component analysis and the cluster analysis. These analyses were based on the primary data from the customers' satisfaction questionnaire survey with the key factors of destination quality. The output of the used statistical methods (principal component analysis and cluster analysis) was the creation of groups and clusters of quality factors that are similar in terms of respondents' evaluations. The gained results showed the possibility to use both statistical methods. The aim is to verify the gained results and to identify the advantages and limits of SEM as well as to provide suggestions for the further use in the tourism research. As a conclusion, we can state that the SEM provides a strong alternative for both mentioned statistical methods. The paper is developed in the frame of the research project aimed at designing a methodology for the tourism destination quality evaluation, especially in the context of customer satisfaction and loyalty.

Keywords: tourism, quality of a destination, dimensions of destination quality, SEM, Cluster Analysis, Principal Component Analysis, tourist satisfaction

INTRODUCTION

In today's competitive environment, quality has become a crucial factor that influences the success of a tourist destination; quality impacts the interest of visitors and improves the image of a destination. The competition among tourist destinations increases, due to the strengthening globalization forces, rapid development of the air transport and easy access to information on prices. From the marketing point of view, we can perceive a destination as a complex product of tourism industry that must attain the necessary quality level, which requires a strategic approach to the management.

Middleton and Clarke (2001) specify that a destination is made up of five components, three of which are the same as the components used by Buhalis (2003; Attraction, Amenities, Accessibility) and the other two components are the image and perception of the destination and price. Grönroos (2007) states that although the service quality is primarily evaluated only in terms of functional quality, the destination assessment by technical quality aspects (the range of attractions and services) is necessary as well.

A wide range of research studies deals with the factors influencing the quality of tourist destinations and their impact on the capacity to compete on the market (e.g. Hsieh et al., 2008; Martin-Cejas, 2006; Truong, Foster, 2006; Chitty et al., 2007; Zhu, Zhao, 2010). However, rather a narrow focus on the partial areas can be seen as the shortcoming of these studies. On the other hand, some studies provide a more comprehensive and complex insight on a destination and its quality (e.g. Krešić, 2008; Xielong, 2011; Žabkar et al., 2010); however, they are less frequent.

The methodology of determining the satisfaction of clients consists of the identification of the most important service attributes in case of which the client's satisfaction is evaluated at a symmetrical one-dimension scale. On the basis of the information stated above it is possible to discover how the satisfaction with various characters influences the overall satisfaction of a client and his or her intention to come back again (Alegre, Garau, 2010). Clients can be satisfied with one attribute and dissatisfied with another. That is why the overall level of satisfaction on the aggregate level can not reflect these differences on the overall attribute level (Oliva et al., 1995). So, attribute measures based on satisfaction provide research workers and managers with a higher level of specification and diagnostic values (Mittal et al., 1998).

The paper shows the results of using SEM (structural equation modelling) in the context of the tourism destination quality evaluation process; SEM was specifically used to ~~verify~~ compare the research results gained by means of the Principal component analysis and the Cluster analysis. These analyses were based on the primary data from the customers' satisfaction questionnaire survey with the key factors of destination quality. The objective of this paper is to present the gained results as well as to provide suggestions for the further use in the tourism research. The paper is developed in the frame of the research project aimed at designing a methodology for the tourism destination quality evaluation, especially in the context of customer satisfaction and loyalty (project GACR, nr. 15-21179S).

METHODOLOGY

The authors' approach to the quality evaluation of a destination is based on the analysis of visitors' satisfaction and the analysis of partial factors of the quality components. There is an effort to

reduce the amount of the quality factors but without losing relevant information about the quality of a destination.

The choice of 15 factors of the quality of a destination was enacted on the basis of the theoretical approaches (Buhalis, 2003; Middleton, Clarke, 2001; Grönroos, 2007) and its relevance was confirmed by the qualitative research (in-depth interviews, 130 respondents: academicians, services providers, employees in destination management and public administration; Vajcnerova et al., 2012).

Primary data were obtained by means of a questionnaire survey among the visitors of the tourist destination of Brno and its surroundings (387 respondents); using quota sampling (age, gender, education) to determine the level of satisfaction with 15 factors of quality, ten point scale was used (1 - least satisfied, 10 - most satisfied). With the aim to reduce the number of the destination quality factors, three statistical methods were used: Cluster analysis, Principal component analysis and Structural equation modelling.

RESULTS AND DISCUSSION

As regards the CLUSTER ANALYSIS, the Ward's method was chosen as the most convenient one; for the similarity measure we used the correlation coefficient. In our case, the quality factors of the destination will represent the variables and the respondents will represent the objects. Our objective will be to group together the variables and not the objects (Punj, Stewart, 1983). Cluster analysis, using the dendrogram, enabled to aggregate particular quality factors into four clusters, as follows:

- 1) *Marketing*: the availability and quality of information about the destination, roads leading to the destination and the offer of product packages.
- 2) *Hospitality of the destination*: welcome and acceptance by local visitors, price level in the destination, the safety of the destination.
- 3) *Services and entertainment*: cultural and social events, the quality of accommodation, the quality of food and dining, the extent and quality of activities and experiences, the transport accessibility of the destination, local transport within the destination.
- 4) *Attractiveness of the destination*: nature attractiveness, the image of the destination, the uniqueness of the destination.

By means of the PRINCIPAL COMPONENT ANALYSIS, the original 15 quality factors were reduced into four representative factors that were named as follows: 1. *Transport and information*, 2. *Hospitality of the destination*, 3. *Service and entertainment* and 4. *Attractiveness of the destination*. Principal

component analysis (PCA) was carried out in several steps. First, original quality factors were replaced by so-called principal components, the most important of which were selected. Each quality factor in the principal component is evaluated by the component weight (component score) within the interval $< -1, 1 >$. Cluster of similar factors were evaluated by means of the weights of the principal component (in our case, there were three of them). The clusters can be identified visually, by evaluating the charts of components weights for the pairs of principal components or by means of the cluster analysis. Each quality factor is represented by only three numbers (component weights for principal components). On the other hand, in the frame of the cluster analysis a quality factor is represented by 387 numbers (amount of respondents). As the component weight is always within the interval $< -1, 1 >$, the choice of the similarity coefficient is not that important when compared to the cluster analysis. For the analysis, the Euclidean distance was chosen as the most convenient one.

We can summarize that both of the methods - Cluster analysis (in case of grouping together the variables and not the objects) and Principal component analysis - provide similar results in the context of quality evaluation. Saracco et al. (2010) also perceived clustering variables as an alternative to PCA.

These results were supported by means of the STRUCTURAL EQUATION MODEL (SEM). We propose the analysis of the overall satisfaction of the chosen destination (Brno and its surroundings) and the factors that influence it. The SEM model (see Fig. 1) is based on the results of both methods mentioned above.

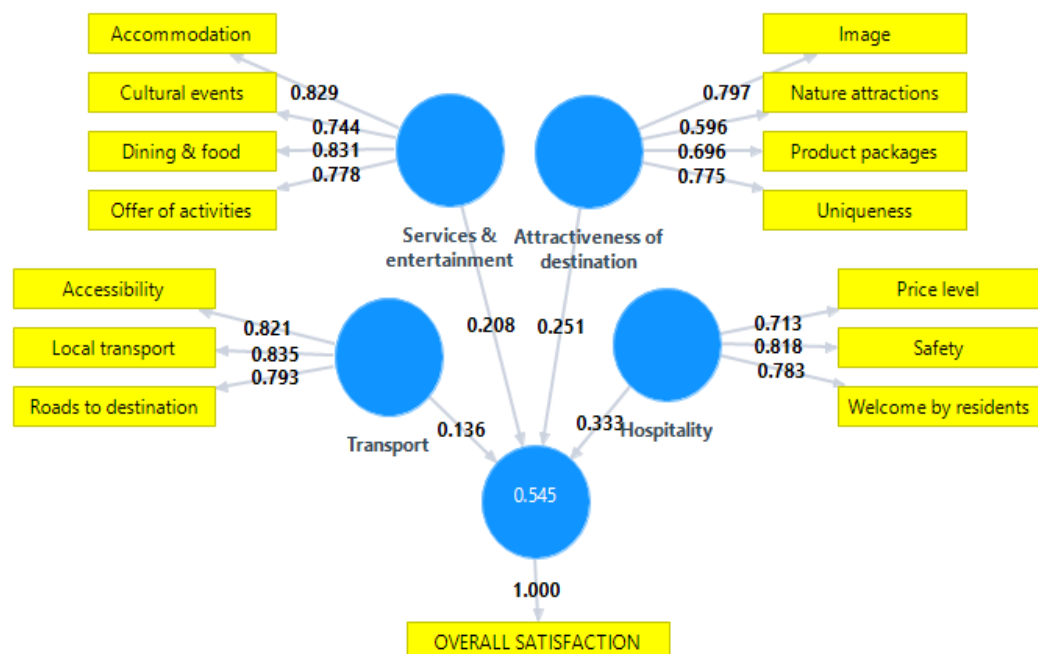

Fig. 1: Model of the visitors' overall satisfaction of the Brno region (Structural equation model); source: authors

The four latent variables correspond to the four representative factors identified by the Principal component analysis (1. *Transport and information*, 2. *Hospitality of the destination*, 3. *Service and entertainment* and 4. *Attractiveness of the destination*). However, there is one difference as regards PCA model; notably, SEM analysis revealed that the quality factor “information about the destination” does not improve the quality of the prediction of the overall satisfaction in the destination in our SEM model; hence it was removed. This factor is equally the least important in the frame of the Principal component analysis; it has the lowest component weights when compared to other quality factors. This finding confirms the usefulness of the structural equation model as it enables to identify the importance of particular quality factors clearly and it reveals causalities explaining the overall satisfaction.

The fact that “information about the destination” does not improve the quality of the model can be - with the highest probability - explained as follows: visitors’ expectations regarding this factor are high and this factor attains a good quality in the given destination (information about the Brno destination is clear, abundant and well accessible, the information infrastructure is well developed). In such case, when expectations are high and quality is good, the factor might not significantly contribute to the explanation of the overall satisfaction.

Table 1 confirms that all the latent variables are statistically significant on the level of 95% (t-statistics > 1.96 and p-values < 0.05); statistical significance was calculated by means of the bootstrapping method (using 500 iterations); this method also allows the use of non-parametric variables. AVE (average extracted variance) is higher than 0.5 for all the latent variables that correspond to the general requirement for the model.

	Original Sample (O)	T (O/STERR)	Statistics P Values
Attractiveness of destination ->	0.251	5.837	0.000
Hospitality ->	0.333	7.312	0.000
Services & entertainment ->	0.208	4.015	0.000
Transport ->	0.136	2.737	0.006

Table 1: Latent variables for the structural equation model, statistical significance; source: authors

CONCLUSION

The suggested structural equation model (Fig. 1) consists of four latent variables (Service and entertainment, Attractiveness of the destination, Transport, Hospitality) that are parallel to the PCA model, except of the quality factor “information about the destination”. Numbers on the lines are correlation coefficients between the variables and the number (0.545) in the circle indicates the amount of the variance explained by the model, which is fairly satisfactory when using this kind of model and calculations.

The use of the structural equation models in the field of the destination quality evaluation is not very frequent. Ebsco database offers several research papers (as of April 2015) that use explicitly the SEM technique in the destination management research that would specifically focus on the visitors' satisfaction or behavioral intentions; as representative examples we mention Ranjbarian and Pool (2015) who carried out the study for the case of Nowhahr city in Iran; Rangaswamy, Chaiboonsri and Chaitip (2008) used the SEM technique to analyze the satisfaction factors when travelling to India; Eusébio and Vieira (2013) developed a methodology based on the SEM to evaluate overall satisfaction and behavioral intentions of the visitors to the Central Region of Portugal or Kim et al. (2013) with the case study of Orlando.

The SEM is a very useful technique to obtain practical and comprehensive understanding of the factors that influence visitors' satisfaction, motivation and behavioral intentions as regards the given tourist destination (Chi, Qu, 2008; Yoon, Uysal, 2005). The attributes of a ski destination choice were researched also in a Finnish survey by Konu et al. (2011). In the case of quality evaluation SEM can offer strong insight into the impact of specific quality factors and specific causalities in relation to the visitors' overall satisfaction. As a conclusion, we can state that the SEM provides a strong alternative for both other statistical methods (Cluster analysis and Principal component analysis) and we encourage the use of the Structural equation models in the field of the destination quality management research.

UTILIZATION OF QUALITY LABELS IN EUROPEAN UNION

Sadílek, Tomáš

Department of Retailing and Commercial Communication, University of Economics, Prague, Czech Republic

ABSTRACT

The paper deals with European Union schemes of Protected Designation of Origin, Protected Geographical Indication and Traditional Speciality Guaranteed labels used in agricultural and food products sector. The aim of the paper is to analyse the utilization of these labels in European Union market according to selected criteria including type of label registered in each country, and number of agricultural products and foodstuffs registered as quality labels in total. The first part of the paper refers to the definition of food quality, quality labels, and European Union quality schemes specification. The second part includes the discussion of marketing research results. Secondary data from the Database of Origin and Registration are used. Sample consists of 1245 labels registered in this database to the 22nd March 2015. The frequency of labels utilization is analysed according to country, type of label, and product classes, also cluster analysis is applied. Pearson's chi-square test of independence is used to determine if significant differences do exist between frequency of using the labels and mentioned criteria.

Keywords: *cluster analysis; DOOR database; food quality labels; Protected Designation of Origin; Protected Geographical Indication; Traditional Speciality Guaranteed*

INTRODUCTION

The paper is focused on the specific problem area of so-called quality labels and presents results of marketing research focused on analysis of using selected quality labels in European Union (EU) agricultural and food products market. The production of food and agricultural products is an important part of the European Union economy. European food and beverages play a major role in the cultural identity of European citizens and regions. High quality of European food is a key advantage for European agriculture (Grunert 2005). Many food and agricultural products exhibit special characteristics linked to their geographical area, traditional composition or traditional production method.

An integral part of EU agricultural policy is an effort to improve food quality and safety. Also consumers in EU countries show growing interest in the quality as well as traditional products. This generates a demand for food and agricultural products with identifiable specific characteristics, in particular those linked to their geographical origin. Producers offering products with the value-adding attributes should communicate them on the marketplace and highlight the characteristics of their products to consumers. Agricultural product quality policy therefore should provide producers with the right tools to better identify and promote such products and protect them against unfair practices (European Parliament and Council of the European Union 2012). Protection of original and traditional food from the EU is not only an important factor in preserving cultural and national traditions in the member states of the EU but also an important dimension of marketing for producers, taking into consideration the consumers' interest and confidence (Nagyová et al. 2011).

In order to allow producers to use the added value of their products as effectively as possible and to facilitate consumers' choice of food products, since 1992, the EU has established quality labels system known as Protected Designation of Origin (PDO), Protected Geographical Indication (PGI) and Traditional Speciality Guaranteed (TSG) to protect the names of these products (EUFIC 2013; European Commission 2012a). These three schemes have built on a long history of regional and traditional specialities, especially in southern European countries (Teuber 2010). The image of the region of origin and the specific product characteristics create a unique identity for food products bringing in this way added value (van Ittersum et al. 2003). The PDO, PGI and TSG labels aim to provide consumers with clear information on the product origin or speciality character, enabling them to make more informed purchases and the best possible choices. (Verbeke et al. 2012).

In the context of the topic, the terms "food quality" and "quality labels" are explained, followed by the specification of surveyed labels PDO, PGI and TSG.

Quality label is a term for a symbol that can be put on a product or its packaging indicating that the product or the process to make the product complies with given standards and that this compliance has been certified (Velčovská a Marhounová 2005; United Nations 2007). Quality labels guarantee compliance not only with current standards, but also with additional quality criteria determined in a corresponding certification system. A quality labels give added value to the products and are usually used in communication with end consumers (The European Committee for the Valve Industry 2007). According to Grunert (2005), quality labels are an ambiguous category that covers many different things. They can be divided into obligatory (determined by legal rules and compulsory for all products in a given product category) and voluntary labels (bring competitive advantage for a product), into general (address all product quality characteristics) and specific labels (focused only on particular

quality characteristics), or into regional, national, international and global labels. They can cover quality, safety, organic origin and other characteristics of product. (Velčovská 2012; Velčovská a Marhounová 2005; Grunert 2005). More about influence of quality labels on its regional distribution offers Parrot (2002).

Food quality labels are determined to promote and protect food products and should be a guarantee of quality products, their geographical origin, specific characteristics and/or production methods (Velčovská a Marhounová 2005). They give a legal protection of a product against imitation throughout the market and eliminate the misleading of consumers by non-genuine products, which may be of inferior quality; they help producers obtain a premium price for their authentic products, and finally they should give clearer information to consumers about product characteristics and facilitate identification of food products with certified quality (O'Connor and Company 2005).

Following text is focused on EU quality labels scheme that identifies agricultural products and foodstuffs farmed and produced to exacting specifications. It includes Protected Designation of Origin (PDO) and Protected Geographical Indication (PGI) for agricultural products and foodstuffs as well as for wine and spirits (there are different rules for wine and spirits and they are not included in our analysis), and Traditional Speciality Guaranteed (TSG) for agricultural farm products and foodstuffs. While a PDO covers agricultural products and foodstuffs which are produced, processed and prepared in a given geographical area using recognised know-how, a PGI indicates a link with the geographical area in at least one of the stages of production, processing or preparation. The link with the area is therefore stronger for PDO; PGI is a more flexible regulation. For PDO food products, management conditions are regulated by very strict rules with the aim of obtaining high quality process (Espejal et al. 2008), the link with the area is stronger; PGI is a more flexible regulation. A TSG highlights a product's traditional character, either in the composition or means of production. According to new Regulation on EU quality schemes for agricultural products and foodstuffs entered into force in the beginning of 2013, in order to be "traditional" proven usage on the market during at least 30 years (instead of 25) is now required. (European Commission 2012a; European Commission 2012b; European Commission 2013c)

MATERIAL AND METHODS

The main purpose of marketing research was to analyse the use of PDO, PGI and TSG label registered in DOOR database for agricultural products and foodstuffs in EU market. The DOOR database includes a list of product names (agricultural products and foodstuffs) registered as PDO, PGI or TSG as well as names for which registration has been applied. PDO and PGI cover also wine and spirits, however

there are different rules for those products (in particular Regulation (EC) No 1234/2007 for wines, Regulation (EEC) No 1601/91 for aromatized wine products, and Regulation (EC) No 110/2008 for spirits) and they are not included in DOOR database as well as other products out of Regulation 1151/2012. (European Commission 2013c). Geographical indications protected in the European Community for wines originating in Member States and third countries are registered in E-BACCHUS database, geographical indications for spirits are listed in E-SPIRIT-DRINKS database.

The DOOR database user can scan a list of product names registered as PDO, PGI or TSG (generally or in selected country), product names can be also sorted according to product classes. However, the user can always see just a list of products. Database does not offer a summarized data and their comparison. Research studies dealing with the topic are focusing only on partial aspects of quality labels like analysis of food products registered as PDO, PGI and TSG in selected countries (Nagyová et al. 2011, Becker 2008), analysis of customer loyalty and buying intention for PDO label (Fandos et al. 2006), consumer awareness and perception of labels (Verbeke W. et al. 2012, Velčovská et al. 2012), consumer behaviour (Espejal et al. 2007), customer satisfaction (Espejal et al. 2008), or impact of labels on customer loyalty (Chrysochou et al. 2012).

As criteria of analysis we set country of origin and type of label. Specific research purposes were as follows:

To identify the frequency of PDO, PGI and TSG labels utilization, to compare using of the labels according to EU countries and to compare using of the labels according to product classes.

The secondary data from the Database of Origin and Registration (DOOR) database were used. In March 2015, DOOR database includes total number of 1435 items, but some of them are on waiting list and there is not sure if they would be accepted (European Commission 2013c; European Commission 2013d). Therefore, in our analysis we have calculated with sample of registered items only, i.e. 1245 items. We have to notice, in database are not only European countries, but also China represented with 10 own products certified with PDO and PGI labels, Vietnam, Colombia, Thailand and India with one registered product name.

In analysis, we proceeded descriptive statistics and contingency tables, where we tested relations with Chi-square test. Method used in for classification of quality labels utilization is cluster analysis in order to find groups of countries, which have similar structure of registered quality labels. Author used cluster analysis to find a homogeneous groups of countries by set factor, a number of products registered as PDO's, PGI's and TSG's.

Each researched category is illustrated by dendrogram as an output of cluster analysis. Cluster analysis is a multidimensional statistical method used to classify the objects. The cluster analysis helps to assign observed units into several groups in such matter that most similar units are included in the some group (cluster) and conversely so that the units of individual clusters differ as much as possible. Individual steps of the cluster analysis differ depending on how the „closeness“ or „distance“ of the units is perceived within the groups, also depending whether the set of units is gradually divided, separated or conversely composed, connected according to a selected criteria (Everitt 2011). There are three main types of clustering methods: hierarchical, parallel and sequential. Hierarchical clustering is a sequence of absorbed decompositions, which on the one side start with a trivial decomposition, where each object of a given set of objects create a separate single-element category cluster, and on the other side the trivial decomposition ends with one cluster containing all objects (Hendl 2009). A hierarchical algorithm yields a dendrogram representing the nested grouping of patterns and similarity levels at which grouping change. The dendrogram can be broken at different levels to yield different clustering of the data (Abonyi, 2007). Then, a one-step clustering procedure (between-groups linkage hierarchical clustering method) was applied to identify distinctive, homogenous products segments. Other frequent methods are nearest neighbour method, furthest neighbour method, centroid method, pair-group average method, Ward's method and K-mean method.

RESULTS AND DISCUSSION

Research outcomes correspond with the date of 28th March 2015, when 1245 product items certified with PGI, PDO or TSG label were registered in the DOOR database. Sample structure is presented in Table 1.

Type of Label	PGI	47.81	Country ¹)	Italy	21.90
	PDO	48.87		France	16.84
	TSG	3.32		Spain	14.14
Product Class ¹⁾	1.6 Fruits, vegetables and cereals	27.05		Portugal	10.30
	1.3 Cheeses	18.32		Greece	8.46
	1.2 Meat products	12.13		Germany	7.85
	1.1 Fresh meat	11.61		United	4.01
	1.5 Oils and fats	10.30		Poland	3.05
	2.4 Bread, pastry, cakes, other baker's	4.36		Czech	2.79
	1.8 Other products of Annex I*	4.10		Slovenia	1.40
	1.4 Other products of animal origin**	2.88		Other	9.26
	Other	9.25			

Table 1. Sample Characteristics (*n* = 1245, in per cent), first 90 % of cases

* Species, condiments, ciders, teas, etc.; ** eggs, honey, various milk products excluding butter etc.

As we can see in Table 1, the highest share has PDO label followed by PGI label. Number of registered PGI (548, i.e. 47.81 %) and PDO labels (560, i.e. 48.87 %) is relatively balanced, with the slight

predominance of PDO. There is only minimum product names registered as TSG (38, i.e. 3.32 %). Based on product class, the most of labels were awarded for fruits, vegetables and cereals. The most frequently certified products come from Italy (251 registered product names as PGI, PDO and TSG, i.e. 21.90 % from all registered product names).

FREQUENCY OF PGI, PDO AND TSG LABELS ACCORDING TO COUNTRY

This part of analysis is based on the list of all countries and product names registered in the DOOR database. The ranking of all countries according to total number of registered product names as PGI, PDO and TSG was created, see Table 2. Fields with the largest number of registered product names under PGI, PDO and TSG are highlighted in grey colour.

Country	PGI	PDO	TSG	Total
1. Italy	8.20	13.53	0.17	21.90
2. France	9.51	7.33	0.00	16.84

Table 2. Numbers of product names registered as PGI, PDO and TSG according to countries ($n = 1245$, in per cent)

* The Czech Republic and Slovakia has registered four the same product names as TSG. Because of this duplicity, the sum of per cent for TSG is higher and also total sum of per cent is higher than 100 %.

As it is evident from Table 2, 24 from 27 EU member countries have registered their product names as PGI, PDO or TSG in DOOR database. Malta, Latvia and Estonia have not yet used this type of protection. The first six countries of ranking in Table 2 (i.e. 22 % of all EU countries) have obtained PDO, PGI and TSG labels for 80 % product names registered in DOOR database (interestingly, the

Pareto rule is shown here). The first three countries in the ranking, Italy, France and Spain, then have more than 50 % of all registered product names. Italy has registered the highest number of product names as PDO; France is the first in number of PGI labels. It is interesting, that most of TSG labels belong to countries in weaker positions in the overall ranking, i.e. to Poland, Slovakia, Belgium and the Czech Republic.

In order to discover reciprocal dependences of tracked characters, we proceeded Chi-square test at significance level $\alpha = 0.05$, when $\text{sig } F = 0$, and we can confirm variables depend reciprocally. Thereby, we accept stated hypothesis about highest distribution of labels in three Mediterranean countries, Italy, France and Spain. Reasons for this could be well-known gastronomic specialities as well as national cuisine of these countries, which have built on a long history and are popular around the world. Overall, these countries have higher impact on global food marketplace, comparing with countries such Luxembourg, Ireland and Lithuania, whose food products are not so popular in customers' minds. Relations in the sample are described by Pearson contingency coefficient (0.514) and Cramer's contingency coefficient (0.424), thus there is weak dependence between number of product names registered in the database and country of origin. These two contingency coefficients are the most basic measure of association between two nominal-level variables (Blaikie 2003).

Labels distribution by countries is also illustrated using cluster analysis and represented graphically by dendrogram, see Figure 1. For better transparency of dendrogram, only first ten countries from ranking in Table 2 were included in cluster analysis. There are three clusters. The first one involves Mediterranean countries, Italy, France and Spain. Furthermore, Italy has its own cluster and category, because of highest share of labels. This is influenced by long tradition of quality labels in these countries, which is multiplied by EU quality schemes. Second cluster is consisted of Greece, Germany and Portugal and third one comes from UK, Slovenia, Czech Republic and Poland with much lower share of labels, between 1.4 – 4.0 % of total. Germany is an interesting example of country, where utilization of quality labels does not have a long tradition, but they benefit from registration of foodstuffs as PDOs and PGIs.

Figure 1. Grouping EU countries by PGI, PDO, and TSG labels

COMPARISON OF SELECTED EU COUNTRIES ACCORDING TO NUMBERS OF PRODUCT NAMES REGISTERED IN THE INDIVIDUAL PRODUCT CLASSES

In the last step of analysis, we compare EU countries by numbers of product names registered in the individual product classes. We wanted to know which product class is the most typical in each country. Because of too high number of items in the DOOR database, we have decided to focus only on countries which have registered more than 15 product names. This is ten first countries mentioned in Table 2 which have registered 90% (1040) items as PGI, PDO and TSG (in March 2015).

The most common product class is 1.6 (Fruits, vegetables and cereals) which is dominant in Italy, Spain, Greece and Poland. Portugal and Slovenia have the highest number of registered products in class 1.2 (Meat products), France in class 1.1 (Fresh meat), UK in class 1.3 (Cheeses). As we expected, the Czech Republic excels in class 2.1 (Beers). Germany is the only country represented in the class 2.2 (Mineral and spring waters) and at the same time this product class is dominant for Germany.

In order to discover dependency between country of origin and the most often registered product class, we proceeded Chi-square test at significance level $\alpha = 0.05$, sig $F = 0$ and we can confirm, there are dependencies between these variables. In the next step, we measured tightness size between same variables with using of Pearson contingency coefficient. Its value is 0.707, which means strong positive dependence between country and the most often registered product class, i.e. each country has one important product class in which the most of domestic products is registered. Similar to the analysis of labels utilization by country of origin, we prove the most product types are registered in Italy, France

and Spain. The most likely explanation is importance of these national food products at the global marketplace, where products like olive oils, cheeses, vegetable a fruit products play important role.

Results are also illustrated using cluster analysis and represented graphically by dendrogram, see Figure 3. In dendrogram, we can see two individual clusters of Italy and France with numbers of registered products different from other. Third cluster is consisted of the rest of countries, but there are apparent distinctions between these countries, because Slovenia, Czech Republic, Poland and UK have much lower number of registered products than Germany or Greece. Spain and Portugal have stable position with high amount of probability even though they are not concentrated in individual cluster.

Figure 2. Grouping EU countries by product classes

DISCUSSION

In the literature, PDOs, PGIs and TSGs are usually modeled as a signal of high quality in a vertical differentiation context. In some countries, importance of PDOs, PGIs and TSGs is very high. For instance in leading countries such France, Italy and Spain a high share of wine is sold under PGIs and important factors for this are soil, climate and traditional know-how, then there is a high importance of geographical location. There also exists real impact on national economies because smaller producers of agricultural and food products can benefit from well-established reputation of EU-wide known quality labels and can manufacture products with added value and differ from their competitors. Furthermore it can affect positive impact on regional development in particular region in form of new jobs.

Success of utilization of European Union quality schemes is influenced by perception of quality in certain European countries. In southern Europe, customers willing to pay more for acquiring a good

from a particular origin (Lucatelli, 1999), but in northern Europe quality is associated more with a set of rules on safety, integrity, or conformity to industrial processes and there is not needed to support traditional know-how of certain geographical origin. Another case are French wines, which names are so well-known, that further geographical protection is not needed, because there are well-promoted brands (for instance Chateau Margaux, Georges Duboeuf, Mouton-Cadet).

The reason why dominate countries such France, Italy and Spain is also long tradition of protection their food products prior nowadays European Union Quality Schemes. For instance, Roquefort, famous French cheese is protected since 15th century, when King Charles VI granted a monopoly for producers in Roquefort-sur-Soulzon only. Perhaps France has the biggest experiences with protection of certain food brands by organization called Appellation d'origine controlee.

CONCLUSION

Presented paper deals with analysis of European Union quality labels scheme known as PDO, PGI and TSG used in agricultural and food products sector. Data comes from the DOOR database and for obtaining outcomes, statistical methods have been used. The main contribution of the paper is a comprehensive view on the topic, the comparison of summarized data according to selected criteria including country of origin, type of label and product class, and statistical testing the relations between using of the labels and mentioned criteria. As results show, the highest number of product names is registered under PDO label followed with slight difference by PGI label. There is only minimum product names registered as TSG. Dominating country is Italy followed other Mediterranean countries like France, Spain, Portugal and Greece. The reason for this could be a long history of regional and traditional specialities in these countries and a higher importance of these products (such olive oil, cheeses, vegetable products and other) on the global marketplace. Based on product class, the most common classes are Fruits, vegetables and cereals (for PGI, PDO), Cheeses (PDO) and Meat products (TSG, PGI). In various countries dominate different product classes, but most frequent are, in consistency with previous results, classes Fruits, vegetables and cereals (Italy, Spain, Greece and Poland) and Meat products (Portugal and Slovenia). Beer is the most typical product class in the Czech Republic. Statistic testing has confirmed weak dependence between number of product names registered as PDO, PGI and TSG and country of origin, middle strong dependence between type of label and product classes where the label is used, and strong dependence between country of origin and the most often registered product class.

Original and traditional agricultural and food products can be perceived as an important part of tradition and image of the region. The PDO, PGI and TSG schemes bring benefits to consumers as well

as to producers. Consumers are assured they are buying a genuine product with specific value-adding qualities. Producers benefits lies in fair competition, protection, and promotion of their products. To take full advantage of these benefits, producers should communicate their products with the value-adding attributes and highlight the specific character of their products to consumers, enabling them to make more informed purchases and the best possible choices. The aim of the communication campaign should be to build awareness, credibility and favourable perceptions about quality and distinctiveness of PDO, PGI and TSG products, and to stimulate consumers' interest in such products.

OPEN INNOVATION IN SMES: A SURVEY IN THE PIEDMONT AREA

Santoro, Gabriele; Ferraris, Alberto

Department of Management, University of Turin, Italy

ABSTRACT

In the current scenario of hypercompetition and technological progress, openness towards external sources of knowledge appears the key to gain and sustain competitive advantages, especially in certain industries. From this point of view, many firms from different industries are increasing their boundaries' openness to external sources of knowledge. Very often, small-medium firms lack the essential internal resources and technical capabilities. Thus, they must increasingly rely on external partners to innovate, but only recently, researchers have started to highlight the importance and the specific nature of open innovation in small and medium-sized enterprises (SMEs).

This paper investigates if open innovation practices is also applied by SMEs. Using a database of 93 SMEs in Piedmont, the research explores the importance of internal and external sources for the innovation development processes. We found that SMEs in Piedmont rely mainly on internal sources to develop new products and services. Moreover, with regard to external sources of knowledge, they primarily rely to one source, the customers.

The research concludes with interesting managerial implications, which provide a conceptual interpretation of the phenomena and try to prescribe actions to managers.

Keywords: *Open Innovation, small and medium-sized enterprises, Source of Knowledge.*

INTRODUCTION

The increasing complexity of the economic situation, the globalization, the hypercompetition and the rising of new technology that characterizes most of the world markets have pushed many companies to rethink their strategies and to open their firms' boundaries in order to facilitate the exchange of ideas and knowledge, in line with the new paradigm of open innovation.

In a such scenario, it is counterproductive for firms to innovate in isolation because the high technology development costs and the shortening of the product lifecycle (especially in high-tech industries). In fact, this makes more expensive the development of technological products. Therefore, firms tries to diversify the business risks across multiple sources and, at the same time, to reduce R&D costs.

In this new contest, mainstream literature identified a number of factors which influence the decision on which tools use to innovate. These factors may vary depending on the home country, the local business configuration and the sector (Chesbrough, 2003).

Customers are usually considered one of the main innovative sources used by firms, because they may enable to directly gather several information usefully to find new technological trajectories and ideas.

The current economic situation also threatens the financial health and the ability to stay into the market of SMEs. Despite SMEs are recognized as a form of enterprise characterized by high innovative capacity and by an open approach (Bresciani and Ferraris, 2012; Ferraris, 2013), mainstream studies on SMEs are almost totally excluded from the traditional discussion on open innovation. From this point of view, in fact, few studies have focused almost exclusively on specific industries.

Thus, the present work aims to investigate the sources of knowledge for innovation mostly used by SMEs in Piedmont, highlighting those that companies better handle, and explore the (underdeveloped) topic of open innovation for SMEs.

In addition, the paper aims at broadening the scope of investigation, considering that most of the studies on open innovation topic have been applied to high-tech companies in US.

The reminder of the paper is structured as follows. Section 2 discusses the theoretical framework; section 3 describes data and methodology; section 4 analyzes findings and trends of SMEs open innovation approach. Finally, section 5 concludes and discusses the implications and limitations of this work.

THEORETICAL FRAMEWORK

Open innovation literature

There was a growing interest on open innovation paradigm over the past decade (Chesbrough, 2003; Gassman and Enkel, 2004; West and Gallagher, 2006; Dahlander & Gann, 2010; Rossi et al., 2013; Brunswicker and Vanhaverbeke, 2014).

The literature on open innovation is very wide, recent and shows many aspects related to management, innovation governance, strategy and competition. Its concept was developed primarily by Chesbrough (2003), which emphasized the transition from Close Innovation, in which innovation processes are accomplished through the traditional R&D represented by a vertically integrated system (Freeman, 1974; Chandler, 1990; Mowery, 1990; Pavitt, 1991), to the new frontier of innovation processes, characterized by relationships between multiple entities which make and share knowledge and technologies that can create more value than stand-alone.

In fact, companies have realized the necessity to move away from the control of the innovation processes according to the traditional model, shifting the focus on open innovation (Chesbrough, 2003). According to the author, the closed model has allowed for a long time to develop successful innovations through the use of talented human resources. However, environmental changes have challenged the traditional model, making it vulnerable.

There are numerous case studies which show the trend of large companies such as P&G, IBM, and Xerox to develop skills and technologies with external organizations and exploiting ideas from outside the company's boundaries, accelerating new products development and achieving a significant costs reduction (Chesbrough, 2003; Dodgson et al., 2006). Therefore, for companies like these, is no longer enough investing large sums in R&D, but they need to have an "open approach" in innovation process management, maintaining a constant focus on market and customer (Gassmann and Enkel, 2004).

How to define the concept of "openness"? Empirical studies on external sources of knowledge define this concept through two parameters. The first concerns the number of external sources used in the innovation development process. The second is associated to the depth of the relationship with each source (Laursen and Salter, 2004, 2006). However, measure the depth of a relationship is not as easy as measuring the number of external sources used. In this sense, the relationship between sources and the company can be very different. Other studies have shown that sources such as universities and research centers are very important for larger high-tech companies, but much less for SMEs, especially those who have a few customers who buy large volumes (Gans and Stern, 2003).

In order to give a more fine-grained picture of this new phenomenon, Gassmann and Enkel (2004) identified three core open innovation processes: the outside-in process (Inbound), the inside-out process (Outbound), and the coupled process, providing a clear classification of the open innovation activities.

The focus of this paper is to investigate the contribution of the so-called inbound activities (the Outside-in Process). In particular, they identify the search for innovative solutions and new sources of knowledge from external partners to incorporate those developed internally (Chesbrough and Crowther, 2006; Chiaroni et al., 2010). In this way, firms may reduce R&D risks and costs, acquire missing knowledge, complementary resources and enlarge its networks (Mohr and Spekman, 1994; Hoffmann and Schlosser, 2001).

These external sources of knowledge can be companies, customers, universities, research centers, suppliers, industry experts (Chesbrough, 2003; Gassmann and Enkel, 2004).

Van de Vrande et al. (2009) refer to *technology exploration* highlighting those activities which enable enterprises to acquire new knowledge and technologies from outside. In particular, they identify five

practices to do that: customer involvement, external networking, external participation, outsourcing R&D and inward licensing of IP. Moreover, Gassmann (2006) assumes that customers involvement is one important alternative to implement internal innovation processes, because they may have several information that would help internal R&D technician to develop new knowledge and invention and to discover new potential markets (Franke et al., 2006; Baldwin and von Hippel, 2009; Dahlander and Frederiksen, 2012).

Thus, firms may benefit from (van de Vrande et al., 2009):

- a) their customers' ideas and innovations by proactive market research;
- b) providing tools to experiment with and/or develop products similar to the ones that are currently offered;
- c) producing products based on the designs of customers and evaluating what may be learned from general product development.

What emerge from this studies is that literature on open innovation is often intertwined with those on user innovation. As noted earlier, one of the most important source of knowledge are the customers (often referred to as "users" in the literature). Within the customer class, literature identifies a segment of "extreme users" which provide an active contribution to the development of new innovative ideas. Some scholars show that those users are part of communities for the development and sharing of knowledge (Franke and Shah, 2003; Fuller et al., 2008) and that they can operate in an independent manner from companies or may bind in different ways through forms of cooperation with the aim at commercializing innovations (Flowers, 2008; Churchill et al., 2009).

Open innovation in SMEs

SMEs are excluded from the mainstream discussion on open innovation (exceptions are van de Vrande et al., 2009; Lee et al., 2010; Parida et al., 2012; Brunswicker and Vanhaverbeke, 2014) even though they are certainly active in innovation development (Chesbrough et al., 2006).

In fact, many SMEs strongly depend on their innovative ability in order to achieve and sustain competitive advantage and, due to increased competition and rapidly technology progress in many industries, they are often forced to develop new products faster and more effectively (Parida et al., 2012).

SMEs can rely on very different types of open innovation activities. While some SMEs tend to use few activities or sources, others tend to engage with different partner and develop different open innovation practices. Moreover, with regard to the types of sources, many SMEs open up their "Value

chain”, while others tend to rely on university and research centers (Brunswicker and Vanhaverbeke, 2010; Cosh and Zhang, 2011).

Furthermore, their innovation processes differ widely from those of large companies, with hallmarks of high flexibility, less formality, faster decision making processes, but of course fewer R&D resources available (Vossen, 1998; van de Vrande et al., 2009; Lee et al., 2010). Due to the lack of internal resources and competencies, it is necessary for this kind of firm rely more on open innovation approaches, in particular they need to take care of: a) inbound activities, seeking knowledge, technology and skills in the external environment (Kogut, 2000; Christensen et al., 2005; Lichtenthaler, 2008; van de Vrande et al., 2009), and b) non-monetary activities such as networking and the informal search for knowledge (Brunswicker and Vanhaverbeke, 2014) rather than monetary activities such as acquisitions and in-licensing.

As well as for large enterprises, SMEs have to develop internal capabilities (Chiaroni et al., 2010; Spithoven et al., 2010; Brunswicker and van de Vrande, 2014), in particular the ability to absorb external knowledge in order to benefit from it (Cohen and Levinthal, 1990). A recent study emphasizes the importance of the capabilities of the management to acquire, exploit and apply external knowledge to produce competitive advantages; they are accessive, adaptive and integrative capacities (Robertson et al., 2012).

With regard to the ownership structure, the SME-specific organizational and leadership characteristics, can leverage the adoption of inbound activities. For example, family-owned SMEs usually have a lower search breadth than those non-family (Chesbrough, 2003).

There are two main empirical studies which prove the importance of open innovation for SMEs. In particular, Lichtenthaler (2008) has conducted a survey among manufacturing SMEs in Germany, Austria and Switzerland, founding that 32.5% of the respondents was somehow engaged in open innovation. Parida et al. (2012) have shown that the adoption of open innovation activities can positively influence the innovation performance of SMEs as much as those of the large companies.

Moreover, other studies emphasize the importance for SMEs to innovate through knowledge and information obtained directly from the customer through an understanding of their needs and experiences (von Hippel and von Krogh, 2006). Thus, SMEs prefer to collaborate with market actors than with horizontal partners like universities, public research centers or government agencies (Diez, 2000; Zeng et al., 2010; OECD, 2013).

Finally, Brunswicker and Vanhaverbeke (2014), through an empirical analysis carried out on SMEs, identify 5 clusters, grouped on the approach to research from external sources, from which emerged a specific category, called “Supply-chain searcher”, characterized by an intense relationship with direct

customers and suppliers, neglecting the cooperation with universities, research centers and, in general, the scientific research.

METHODOLOGY

The main purpose of the research is to investigate the sources of knowledge mainly used by SMEs of Piedmont. A total of 422 SMEs from different industries were investigated through a structured questionnaire and data granted directly by the firms. The response rate is 31% and, due to incorrect answers or missing values the final sample includes answers from 93 SMEs. The questionnaire consists of questions from different nature concerning:

1. General questions on the Family and the Company;
2. Family and firm values;
3. Product development process.

The questions on the “product development process”, useful to achieve our paper’s goal, were structured so as to respond with a scale from 1 (not important) to 5 (very important).

So, each firm was asked to indicate on a 0-5 scale the degree of use for a list of sources, divided in three categories: Internal, External and Scientific.

Data collected were processed, analyzed and combined with available bibliography, companies’ documents and internet websites; the data-triangulation is useful to validate and integrated all the information coming from different sources (Olsen, 2004).

To better understand the characteristics of the sample firms, the following tables show classifications by company size, age and sector. Most of these are family firms.

Number of employees	%
Micro firms (<10)	12,62
Small firms (≥10 and <50)	53,13
Medium firms (≥50 and <250)	34,25

Table 1. *Company’s size*

Age of firms	%
Less than 5 years	4,48
Between 5 and 15 years	29,32
Between 15 and 30 years	37,76
More than 30 years	28,44

Table 2. *Age of firms (percentage)*

Most of the sample consists of manufacturing firms. Those belong to the high-tech sector for almost 42%, and to the low-tech sector for 32%. Low-tech manufacturing firms are companies that, despite being included in such industrial contexts, achieve important innovation activities, mostly of incremental nature and focused on innovation processes. Approximately 8% of the firms operate in the field of advanced services (studies of engineering, consulting corporate services, R&D products).

Industry	%
Commerce and service	7,95
ICT	10,12
Manufacturing (high tech)	42,10
Manufacturing (low-tech)	32,05
Advanced serviced	7,78

Table 3. *Firm's industry (percentage)*

The turnover share relating to the three main customers of the companies also reflects the high dependence from this innovation source, who have strong bargaining power. Tab. 4 highlights the dependence of companies from their customers, who typically buy large volumes and, consequently, the concentration of the revenues. In addition, almost half of the sample (48%) is composed of companies that sell both products and services, while 32% is devoted solely to the sale of products. Most of these firms have a B2B business model.

Market share first 3 customers	%
Less than 20%	17.17
Between 20% and 40%	30.71
Between 40% and 60%	26.36
Between 60% and 80%	16.23
More than 80%	9.53

Table 4. *Market share of the first three customers*

FINDINGS

This work has the purpose of identify the sources of knowledge used by SMEs in Piedmont for the innovations development. The collaborations and technology transfer agreements provide insight

how the local area offers to the companies an ecosystem that encourages the development of ideas, innovations and technologies.

Results indicate that one-third of the sample analyzed does not have an "open" approach in developing new products and services (tab. 6). Evidently, these companies do not consider important external sources of knowledge. Specifically, 33% of firms attaches little importance to these external sources and only 28% used R&D agreements with external entities.

Therefore, few companies participate in the so-called "technology markets". In fact, innovation activities seem to be reside into strategic relationships with some customers that represent a large proportion of company's turnover. This confirm that customers are the external source primarily used by firms to innovate (tab. 6).

Even for SMEs, thus, the processes of learning and technological innovation are based on a few channels of knowledge and interaction with the outside environment.

Furthermore, another significant result emerges: only 20% of the sample identified relationship with universities as an important factor in the ideas and knowledge development.

It should be noted that the internal sources have a fairly substantial weight, and, among these, the Technical head office plays a fundamental role. For external sources, the use of customers as a source of knowledge has a very significant role for the 54% of respondents; this is quite consistent with the fact that the sample is composed of many SMEs engaged in business-to-business activities and with sales concentrated on relatively few customers. Other contributions to the innovation process come from marketing (57%), production (50%) and competitors (31%).

Type of source	Source of knowledge	Mean	≥4
	Technical head office	4,26	82%
Internal sources	Marketing	3,59	57%
	Production	3,38	50%
	Customers	3,89	54%
External sources	Competitors	3,04	31%
	Partners	2,48	27%
	Suppliers	2,78	23%
	University	2,45	20%
	External consulting	2,35	16%
Scientific sources	Technical pubblication	2,52	22%
	Scientific publication	2,30	15%

Table 5. *Sources of knowledge used*

As a result, emerges the centrality of the customer in the innovation process, just as shown in the literature review. Conversely, companies that show a close proximity to the academic world of university research and scientific or technical publications are restricted subsets of the sample analyzed.

Considering the number of external sources deemed relevant to the innovation process and according to Laursen and Salter (2004) (tab. 6), there are several relevant results: for the 33% of the sample there is no external source among the categories identified to have a high importance in the innovation process.

Number of sources	Freq.	%	Sum %
0	31	33.33	33.33
1	13	13.98	47.31
2	18	19.35	66.66
3	11	11.83	78.49
4	9	9.68	88.17
5	5	5.38	93.55
6	4	4.31	97.86
7	1	1.07	98.93
8	1	1.07	100
Tot.	93	100	

Table 6. *Number of external sources*

Referring to the notions of open and closed innovation proposed by Chesbrough, we may therefore conclude that for these firms, innovation is essentially closed and is not based on significant contributions from the outside and collaboration with other actors. The 14% of the sample attaches strong importance to only one source; for the majority of these firms are the customers the source with strong importance in the innovation process. Furthermore, it is important to note that only 20% of firms in the sample innovation is open to more than three types of sources.

CONCLUSION AND DISCUSSION

This paper investigates the approach of SMEs to open innovation focusing on the sources of knowledge mainly used to innovate and the number of external sources used, taking into account the local business structure of Piedmont, largely characterized by the presence of SMEs, and its approach to innovation.

As seen in the literature, resource constraints should make SMEs very active in adopting an open approach (Gassmann and Enkel, 2004; Christensen et al., 2005; Lichtenthaler, 2008; van de Vrande et al.; 2009).

Our results show that SMEs in Piedmont do not adopt an open innovation approach, at least not in the sense of Chesbrough (2003). More in particular, considering the weight of internal sources on the external ones, we can assume that SMEs in our sample make little use of open innovation. In fact, firm's innovativeness is supported mainly by the contribution of technical head office and marketing office, two type of internal sources.

According to Laursen and Salter (2004), the degree of openness is expressed by the number of external sources used to innovate. In line with this definition, our results show that SMEs in Piedmont have a low degree of openness, considering that only 20% of firms in the sample innovation is open to more than three different kind of sources.

From this perspective, rely on many sources of knowledge requires management efforts and create economic and organizational challenges; in this sense it increases the complexity of coordination and integration costs. Perhaps this is the greatest challenge for SMEs in adopting a more intense open innovation approach.

Considering only external sources, SMEs prefer collaborate with market sources like customers rather than with university and public research centers. These results are in line with the literature (Diez, 2000; Zeng et al., 2010; OECD, 2013; Brunswicker and Vanhaverbeke, 2014). In fact, it emerges that customers are the most important external sources of knowledge for the respondents (54%). This probably because most of the sample have a B2B business model (almost 95%), and it is very important to innovate with a close collaboration with the business customers, which have their specific needs.

From the evidence discussed in this paper, we can derive managerial implications. The lack of financial resources and technical capabilities lead SMEs to adopt a particular open innovation approach that is very close to a co-development process with their customers. Moreover, Piedmont SMEs are too dependent on their customers and this could be a risk in a situation of extreme competitiveness and easy erosion of market share. The survival of these firms often depends on the relationship with one or a few customers, who, therefore, have high bargaining power. This lead to a trade-off. On one hand, innovate in close contact with them is an advantage in terms of obtaining direct information necessary to introduce new radical or incremental products or services. This allows to straightly identify the needs of the market and avoid unnecessary R&D spending. Furthermore, it helps mitigating threats arising from the shortening of product life cycles introducing new solutions quickly. On the other hand, it involves a high risks, as the failure of a customer or the possibility that it

can choose a competitor's product. In this context, it would be more appropriate a high "openness" to different sources of knowledge.

As stated in the previous section, only 20% of the firms of our sample rely on university to innovate; these are mainly start-up many of whom were born within the university environment through help of incubators and technological hubs and the formation of team composed of researchers and professors.

From a managerial perspective, the size of these firms is another factor preventing high levels of research knowledge and technologies in the external market. In fact, the small size limits the dimension of the technical head office and management team, which plays a crucial role in the exploration outwards and coordination with partners. Furthermore, SMEs doesn't have the absorptive capacity that big enterprises do, so they doesn't have the strength to handle and manage multiple sources of knowledge.

The current paper provides a new qualitative conceptualization of openness in SMEs, but also presents several limitations. The most relevant is that it focused on the sources of knowledge mainly used to innovate and the number of external sources used, but says nothing about the innovation and financial performance achieved thanks to the "open" strategy choices.

Another limitation concerns the range of the sample; in fact, the focus of this study has been solely on SMEs in Piedmont. This offer an avenue for future research, so it would be interesting to enlarge the analysis at a national and international level.

Moreover, future research could be directed toward a comparative analysis of innovative performances of SMEs from different sectors. Finally, according to Brunswicker and Vanhaverbeke (2014), future research should provide answer on "how" SMEs can use network and social capital by purposively using inflows and outflows of knowledge.

LUXEMBOURG'S MULTICULTURAL, MULTILINGUAL EDUCATION SYSTEM AND HOFSTEDE

Schinzel, Ursula

United Business Institutes, Luxembourg

ABSTRACT

The purpose of this study is to describe and explain the Luxembourgish trilingual public education system considering the special cultural pattern following Hofstede et al. (2010). 154 questionnaires were collected and 36 interviews conducted among 1) Luxembourgish with Luxembourgish Nationality (Lux.Nat.), 2) Luxembourg residents including Lux.Nat. and foreigners who reside in Luxembourg (Lux.All.), and 3) the rest of the world (World). More specifically cross-cultural management theories by Hofstede et al. (2010), Hofstede (2001) and House et al. (2004), in combination with language theories by Lewis (2006), Blackledge and Ceece (2010), Cummins (2000), García (2014, 2009), and language and management theories by Brannen, Piekkari & Tietze (2014) serve as basis for the language as identifier theory (Schinzel, 2013a). There is a high failure rate of school students who tend to not understand the language of instruction especially in mathematics, biology, chemistry, and history, and the command of the English language in schools is insufficient. Some of the interviews are reprinted; discussion, implications, and recommendations for future research follow.

Keywords: *Language and management, Hofstede, education, cross-cultural management, international business, language, trilingual public education system, Luxembourg*

INTRODUCTION

The language situation in Luxembourg has been subject to actions plans (MENJE), numerous researches, publications, discussions, debates (Fehlen, 1998a; Maurer-Hetto, 2009; Horner, 2007; Weber, 2014a), and reforms (FGIL, 2012; Kurschat, 2014a,b), involving even the OECD (Carey and Ernst, 2006). Despite these efforts a solution to the complexity of the situation – integration versus separation (Fehlen et al., 1998b) – seems a remote, unattainable goal. Plurilingual school goes in parallel with conflicts (Elcheroth, 2010, pp.40), and reflects the complexities and paradoxes of a multicultural national identity shaped by history (Kraemer, 1995, pp.74-75).

Luxembourg

The language situation in Luxembourg's schools is deeply anchored in the specific place the Grand Duchy of Luxembourg takes in Europe and in the world. With its small size of only 2,586 km², 82 km long and 57 km wide at its longest and widest points it is one of the smallest European countries. Its borders are with Germany (138 km), France (73 km), and Belgium (148 km) (The World Factbook). The population is growing fast, as in 1991 it was 384,400, in 2001 it was approximately 439,500, in 2011 it was 512,400, in 2013 it was 537,000 (statec, 2014), and in March 2014 it was 549,680 (statec, 2014).

The resident population as of 1 January 2014 (statec, 2014) included 90,764 Portuguese, 37,158 French, 18,773 Italians, 18,159 Belgians, and 12,659 Germans, see <http://www.statistiques.public.lu/stat/TableViewer/tableView.aspx>.

To show the specific situation of cross-border workers in Luxembourg, the data from Statec from 2014 are taken, where Luxembourg's total population consisted of 537,000 inhabitants of whom 298,200 (55.53%) were Luxembourgers and 238,800 (44.47%) were foreigners. Domestic employment was 379,000. During the daytime, 156,900 cross-border workers came to Luxembourg to work, 39% of the domestic employment: 77,800 from France, 39,500 from Belgium, and 39,600 from Germany (Schinzel, 2013a). You have to genuinely understand the meaning of '*Mir wëlle bleiwe, wat mir sin*' [*We want to remain what we are*] (Berg, 1993).

The national language is Luxembourgish (Lëtzebuergesch), and administrative languages are French, German, Luxembourgish (statec, 2014). Citizenship is only awarded to people who speak Luxembourgish (Spizzo, 1995). The language defines the in-group (Briley et al. 2005) and the out-group. Those who speak Luxembourgish are part of the in-group and those who do not speak the language are part of the out-group.

Table 2 (Schinzel, 2014b) shows Hofstede's cultural dimensions of Lux.Nat. and Lux.All., Hofstede's estimates on Luxembourg, his data for France, Germany, the UK, Belgium FR, Belgium NL, Italy, the Netherlands, China, the USA, and Japan, where the cultural differences become clear.

Table 2 Cultural Comparisons: The author's Luxembourg, Lux.Nat. in comparison with Hofstede's UK – Belgium FR – Belgium NL – Italy – the Netherlands NL – China –USA – Japan (on a scale from 1-100, 1 being the lowest and 100 the highest score)

Management scholars

Management scholars, such as Hofstede (2001), Hofstede et al. (2010) and House et al. (2004) have acknowledged that language has indeed an impact on culture. Hofstede (2001) defines culture as the “collective programming of the mind which distinguishes the members of one human group from another”. This explains the author’s choice of 3 different groups for the present research: Lux.Nat., Lux.All., World. This research does not investigate Hofstede’s 6 dimensions of culture, but rather the murky field of language and management, it tests their theory of culture across languages rather than across national borders, which is what the above mentioned management scholars do. Hofstede et al.’s (2002) criticism of his own theory goes, among others: “Nations are not the best units for studying cultures”. Blackledge and Creese (2010) situate linguistic practices in their respective social, historical, cultural and political contexts, Brannen, Piekkari and Tietze (2014) combine language and management and Schinzel (2014a,b) uses language as identifier. Lewis (2006) explores the relationship between language and thought, how the mind is conditioned culturally at an early age, how the cultural capital in organizations is used in negotiation and decision-making, in meetings, in leadership, in communication style, in listening habits, in team-building mechanisms, all conditioned by language. Jim Cummins (2000) teaches and researches Canada’s bilingual language situation, French-English at the University of Toronto, where he founded the ‘Teaching English as a Foreign Language’ TEFL certificate. He uses the CALP – Cognitive Academic Language Proficiency theory to manipulate a second language in a sophisticated manner after several years of practice and the BICS, Basic Interpersonal Communicative Skills, achieved by all normal native speakers of a language, but a challenge to second language learners, who typically would need 1-3 years to develop BICS following Cummins (2000). Ofelia García (2009, 2014) researches Hispanic and Luso-Brazilian languages and literature in the USA at the City University of New York, published on language education, speaking out in favor of bilingual education and more recently tending to translanguaging. Bringing further light to the multiple facets and the critical interplay of language on global business effects could be the outcome by applying the research by Brannen, Piekkari and Tietze (2014, p. 495) on combining language and management in international business in Luxembourg.

The Luxembourgish public school system

Kraemer (1995) describes the situation in multilingual Luxembourg as follows: the language issue starts already in pre-school, as the instruction language is Luxembourgish, which represents a problem for foreign children, who often speak French or Portuguese. Luxembourgish is given the ‘integration’ function, preparing foreign children for an alphabetization in German in primary school. Later, French will replace German progressively to become the main language instruction in secondary school (Weber and Horner, 2008).

To cite Weber and Horner (2008, p.89): “Moreover, there are few alternatives for parents whose children cannot cope with the state school system. The small number of private, religious (i.e. Catholic) schools follows the state school curricula and students take exactly the same examinations, including the Secondary School Leaving Examination. The only alternatives are the Lycée Vauban, the Waldorf School, the European School and the International School, but they tend to charge high fees and to cater for an international elite. As a result, the only other option taken up by 3.6% of the school population is to attend schools just across the border mostly in Belgium or France (Berg and Weis, 2005, p.58).”

HYPOTHESES

There are more issues to the research subject besides the five main themes 1) integration not separation of the population, 2) learn the three official languages of the country: Luxembourgish, French, German, 3) be prepared for the multilingual and multicultural reality in Luxembourg, 4) high failure rate given the fact that children do not understand the language of instruction especially in mathematics, biology, chemistry, history, and 5) pupils do not learn English well enough.

The author formulates the following three hypotheses.

Hypothesis 1: Lux.Nat. will highly favor trilingualism. Lux.All. will be less in favor of trilingualism. The rest of the world will be afraid of trilingualism in education.

Hypothesis 2: Lux.Nat. will be against bilingualism. Lux.All. will be less against bilingualism. The rest of the world will favor bilingualism.

Hypothesis 3: The other school options will be equally less preferred by all three categories: Lux.Nat., Lux.All., World.

METHODS

Questionnaire respondents

Business men and women in Luxembourg and all over the world were asked to fill in the questionnaire. Companies in Luxembourg and worldwide were chosen and not more than 10 respondents per company considered, allowing a representative view on the situation. The questionnaire was completed by a total of 154 respondents, divided into three categories, Lux.Nat, Lux.All., World, as follows: 110 residents of Luxembourg, out of them 62 Luxembourgers with Luxembourgish nationality (Lux.Nat.). Other nationalities among the Luxembourg residents were Italians (19), French (13), Portuguese (11), Spanish (3), Germans (2), Dutch (2), Belgians (2), Polish (1),

Czech (1), Slovak (1), Greek (1), and Kazakh (1). 152 questionnaires were usable, 2 were not filled in completely.

The 42 residents outside of Luxembourg (from the rest of the World) came from Canada (13), France (8), Italy (3), Germany (2), Greece (2), Belgium (2), Switzerland (2), China (1), Israel (1), the USA (1), Turkey (4), Spain (1), and the UK (1).

The following languages are native languages: Luxembourgish (52), French (24), Italian (19), Portuguese (13), German (6), English (5), Russian (5), Turkish (4) and Spanish (4). Other mother tongues among the respondents were: Turkish, Mandarin, Cantonese, Taiwanese, Creole, Hebrew, Czech, Greek, Dutch, Vietnamese, Polish, Arabic, Slovak and Catalan, each accounting for 1 respondent.

Out of the 154 respondents, only 1 person indicated having 3 mother tongues: Portuguese, German and English. 2 respondents speak seven languages, 13 speak 6 languages, 22 speak 5 languages, 49 speak 4 languages, 33 speak 3 languages, 24 speak 2 languages, and only 6 respondents speak just one language. In general it can be said: most Lux.Nat. speak Luxembourgish, German, French, English, some in addition speak Portuguese, Italian and/or Spanish. Most French speak just French, some with a little English. Most Portuguese living in Luxembourg speak Portuguese, Luxembourgish, German, French, and some English. In general, English native speakers just speak English, without any other foreign language notions, some with a little Spanish.

Interestingly, only eight people indicated having 2 mother tongues.

Out of the 154 respondents, 13 have double nationality, and 17 changed their birth nationality into another nationality.

In total the 154 respondents come from 29 different countries and speak 22 different languages.

The respondents' age categories were age 0-19 (2), age 20-24 (13), age 25-29 (11), age 30-34 (14), age 35-39 (16), age 40-49 (40), age 50-59 (35), over age 60 (20).

38% of the respondents were males, 62% females.

There is an equal distribution of all diplomas among the respondents: A-level (33), professional education (19), undergraduate degree (16), master's degree (43), doctorate (29), other (10).

Concerning job type, the distribution consists of 18 civil servants, 41 teachers/professors, 18 employees, 9 assistant/secretaries, 4 consultants/HR, 9 bank managers, 6 manual workers, 14 retired, 2 house wives, 5 commercials, 8 hospital workers, 3 IT managers, 2 lawyers, 1 architect and 11 students.

The industry sectors of the respondents are: the state/government (24), education (53), bank/finance (34), hospital/medical (5), construction (3), none (12), industry (2), IT/high tech (4), and services/commerce (12).

The open questions of the questionnaires allowed the respondents time and space to write down their private opinion in their own words about the present trilingual public education system.

Interviews were semi-structured, carried out in Luxembourgish, French, German, Italian, and Spanish, and lasted 15-60 minutes. While the open questions provided mainly short answers to the research question, interviews allowed more in-depth, longer, more precise answers, going into detail, leaving room for private stories about the respondents own children, the fears, threats, thoughts, opportunities seen and success stories.

Process

Nationality does not always correspond to native language and therefore questionnaires were distributed in English, French, German, unfortunately not in Luxembourgish, although this was much requested. A pilot study was conducted to pre-test the questionnaire's face validity. Precautions have been taken to ensure confidentiality, as ethical concerns may emerge at all stages of the research (Elms et al. 2010). Questionnaires have been anonymous. Equity in treatment regardless of gender, race or nationality was always guaranteed (Robertson 2008). After the initial screening and cleaning of the collected data, the average, standard error, median, minimum, maximum, minimum-maximum, Q1 and Q3 were calculated in Excel. Four categories were created: (1) All respondents, (2) respondents with Luxembourgish Nationality (Lux.Nat.), (3) all residents of Luxembourg (Lux.All.), (4) residents outside of Luxembourg – the rest of the world (World).

Additionally, the open questions provided deep insight into the thoughts, fears, ideas, threats, and opportunities of the present education system. By respecting the same four categories: all, Lux.Nat., Lux.All., World, the open questions were categorized into broad themes: 1) integration not separation of the population, 2) learn the three official languages of the country: L+D+F, 3) be prepared for the multilingual and multicultural reality in Luxembourg, 4) high failure rate given the fact that they do not understand the language of instruction especially in mathematics, biology, chemistry, history, and 5) pupils do not learn English well enough. Some open questions are reprinted hereafter.

Finally, the interview responses were categorized into the same four categories and main themes as the open questions. Success stories were told, as well as stories of failure. Respondents allowed deep insight into their private lives, answering with great honesty the very important questions regarding their children's education. Some interviews are reprinted hereafter.

RESULTS AND DATA ANALYSES - QUESTIONNAIRE

Following the above initial preparations of the data basis the calculation of the questionnaire's results provided the following results:

Results from the question: What are the advantages of this trilingual public education system (the current education system)?

Regarding the advantages of the current trilingual public education system, the scores among the 152 total valid respondents divided into the three categories Lux.Nat., Lux.All., World were as follows:

The differences in scores were not so important, as 'Integration of all children into the multicultural, multilingual, multinational environment in Luxembourg' scored highest (4.06) with Lux.All., followed by Lux.Nat. (4.02), and only third by the rest of the world (3.90). 'Children learn 3 languages and have the opportunity to study in L, G, F' scored highest with Lux.Nat. (4.31), followed by Lux.All. (4.13) and third the rest of the world (4.17). 'Children are educated following the multicultural education in Luxembourg' scored highest with Lux.Nat. (3.88), followed by Lux.All. (3.85) and third by the rest of the world (3.69). 'Children are prepared for the multilingual reality of Luxembourg, for the future, for work, for life' scored highest the World (4.05) followed by Lux.All. (4.04) and Lux.Nat. (3.97). 'L+G+F is to be seen as ONE language, not three, we add English, Spanish as foreign language' interestingly reverses the scores' order, the world scoring highest with 3.02, followed by Lux.All. (2.69) and last Lux.Nat. (2.53). This advantage scored lowest of all advantages in all points. 'Often, none of the three languages (L+G+F) is the mother tongue of the children at home, but it is Portuguese, Italian, ..., what allows pupils an alphabetisation in L+G+F' again shows the order Lux.All., Lux.Nat., World, by scoring 3.62 Lux.All., 3.54 Lux.Nat. and 3.38 World.

The above numbers demonstrate that the World has a different view of the current situation than Lux.Nat. of themselves, or Lux.All. in general of the country they are living in.

The absolute highest score for all of the above answers with 4.31 out of 5 is by Lux.Nat. is 'Children learn 3 languages and have the opportunity to study in L, G, F'. Following the respondents of this research this is the biggest advantage of Luxembourg's trilingual public education system.

The absolute lowest score with 2.53 out of 5 is by Lux.Nat. for all of the above answers is 'L+G+F is to be seen as ONE language, not three, we add English, Spanish as foreign language'. In fact, the result shows that Luxembourgish, German and French are well to be seen and treated as three different languages and not as one.

Results from the question: What are the disadvantages of this trilingual public education system (the current education system)? :

Regarding the disadvantages of the current trilingual public education system, the scores among the 152 total valid respondents divided into the three categories Lux.Nat., Lux.All., World were as follows:

The differences in scores were not so big, as 'Pupils do not understand the language of education and therefore cannot follow the content in i.e. biology, mathematics, chemistry...' scored highest among Lux.Nat. (3.42), followed closely by Lux.All. (3.35), and third by World (3.19). 'Pupils are not performing well in the field of study (i.e. biology, mathematics, chemistry...), because they don't understand the language' as disadvantage scored highest among Lux.Nat. with 3.53, followed by Lux.All. 3.34, and with 3.14 for the World. 'This causes a high failure rate' scored again highest with Lux.Nat. (3.46), followed by Lux.All. (3.33) and with a low 2.76 for the World. An explanation for this low score might be the fact that they might not be familiar with the relatively high failure rate of the current trilingual Luxembourgish public education system. 'Loss of identity in terms of culture. Language is not only a method of communication but also determines my cultural identity, my: who am I?!' scored highest among Lux.All. (2.99), followed by Lux.Nat. (2.81), and closely by the World (2.79). The foreigners in Luxembourg know from experience about their loss of cultural identity. The last advantage in the list changes the order in the score, showing that the World has a different opinion on this than Lux.Nat. or Lux.All. 'Pupils do not learn well English. English is neglected. L+G+F preferred' scores highest among the World (3.29), second by Lux.Nat. (3.00) and nearly identical by Lux.All. (3.01). Here the World allows a little critique at the English level of Luxembourg residents, that they themselves do not concede as being an issue.

The above numbers demonstrate that the World has a different view of the current situation than Lux.Nat. of themselves, or Lux.All. in general of the country they are living in..

The absolute highest score for all of the above answers with 3.53 out of 5 is by Lux.Nat. is 'Pupils are not performing well in the field of study (i.e. biology, mathematics, chemistry...), because they don't understand the language'. The respondents to this study demonstrate what represents the greatest challenge of the trilingual public education system in Luxembourg: pupils do not understand the language of instruction of the math or biology or chemistry class. Were the class in their mother tongue they would perform normally, but given the fact that the subject is treated in a foreign language, the issue comes with understanding a difficult subject (math, biology, chemistry, history) in addition to the issues with the foreign language. There are too many issues to be solved at the same time, children simply give up, abandon, drop out and fail. This is the explanation for the unusually high failure rate of the Luxembourgish public school.

The absolute lowest score with 2.76 out of 5 is by the World for 'This causes the high failure rate'. This score might be originated by the lack of knowledge of the World about the indeed high failure rate. Therefore the author prefers to consider the second lowest score with 2.78 out of 5, again by the World for 'Loss of identity in terms of culture. Language is not only a method of communication but also determines my cultural identity, my: who am I?!'. In the World's opinion,

identity is not lost through several languages at school. Identity is conserved, guarded despite different languages in use.

Results from the question: What would be the advantages of this bilingual public education system (the discussed proposed but contested reform-system: In Kindergarten the language of education would remain Luxembourgish. But then the child would have the choice between a full education (primary and secondary) in German language of instruction, or in French)?:

Regarding the advantages of the bilingual public reform system, the scores among the 152 total valid respondents divided into the three categories Lux.Nat., Lux.All., World were as follows:

The differences in scores were not significant, as 'All children still would learn Luxembourgish in Kindergarten' was answered nearly identically by all three categories: Lux.Nat. (3.95), Lux.All. (3.87), the World (3.89). 'The choice of one language of instruction for primary and secondary education allows that children understand the content of instruction (i.e. biology, mathematics, chemistry...)' scores highest among the World (3.74), followed by Lux.Nat. (3.68), and nearly identical by Lux.All. (3.65). 'The failure rate would decline' scores highest by Lux.All. (3.36), second by Lux.Nat. (3.27), and lowest by the World (3.19). 'Children could better concentrate on the content of instruction than on the language of instruction' scored highest by Lux.All. (3.70), followed nearly identically by Lux.Nat. (3.69) and third by the World (3.55). 'Better motivation of children who will be more motivated to learn the different subjects thanks to the taught language' scored nearly identically among all three categories: Lux.Nat. (3.44), Lux.All. (3.44), the World (3.43). Nearly everybody has the same opinion on the children's motivation. Again, 'Pupils could concentrate better on learning English' got the highest score from the World (3.48), followed by nearly identical second and third places for Lux.Nat. (3.21) and Lux.All. (3.20). The World has the opinion that people in Luxembourg generally do not speak that well English and should concentrate more on learning English, contrary to people in Luxembourg, who think they could concentrate more on English, yes, but in the end, our English is not that bad.

Results from the question: What would be the disadvantages of this bilingual public education system (the discussed proposed but contested reform-system)?

Regarding the disadvantages of the bilingual public reform system, the scores among the 152 total valid respondents divided into the three categories Lux.Nat., Lux.All., World were as follows:

'This reform system would be a separator of the population – those who speak German – divided from those who speak French' scores highest among Lux.Nat. (3.86), followed by Lux.All. (3.67), and third by the World (3.40). 'This separation in 2 different languages would divide the society

into different levels' scores highest among Lux.Nat. (3.60), followed by Lux.All. (3.60), and third by the World (3.12). 'Children/Pupils would not be prepared for the multilingual reality in Luxembourg, where at least L, G, F are needed in everyday situations' scored highest among Lux.Nat. (3.95), followed by Lux.All. (3.75), and third by the World (3.31). 'There might not be enough teachers in Luxembourg capable of teaching and/or in German and/or in French in primary and secondary school' scores highest among the World (3.19), followed by Lux.Nat. (2.88), and third by Lux.All. (2.78). This shows the different point of views from the outside or from the inside on the subject. 'There would be an administrative problem, because this division would duplicate all classes, new school rooms would be needed, new schools would be necessary to construct' scores highest among Lux.Nat. (3.57), followed by Lux.All. (3.46) and third the World (3.48). 'This language division (in German or French) would re-enforce the cultural division into German or French culture' scores highest among Lux.Nat. (3.76), followed by Lux.All. (3.63), and third by the World (3.50). The results of this study prove that Lux.Nat. are indeed afraid of a cultural division of their country. 'Other countries (Germany, France,) also experience the same problem with immigrant children not understanding the language of instruction in class' scores highest among the World (3.52), followed by Lux.Nat. (3.31), and third by Lux.All. (3.22). This studies' result demonstrates that, in the opinion of the World, Luxembourg is not the only country in the world experiencing these problems of multiculturalism and multilingualism.

Results from the question: What is your personal opinion. Which system would you prefer?

In the category "All respondents" out of a total of 152 valid respondents 98 were pro trilingualism, which corresponds to 64%. Only 54 were against, corresponding to 35%. Bilingualism was favored by 45 (30%), with 105 (69%) voices against. Other schools (European School, International School, Lycée Français) were favored by 56 (37%), and 92 (61%) were against.

In the category "Lux.Nat" these equations change. Out of a total of 62 Lux.Nat. the trilingual public education system was preferred by 53 (84%), with only 9 (16%) voices against it. Regarding the bilingual reform system, only 9 (16%) were for it, whilst 53 (84%) were against it. Other schools were considered positively by 23 (36%), but negatively by 37 (64%).

In the category "Luxembourg including all nationalities" these results change again. Out of a total of 110, still 77 (69%) are pro the current trilingual public education system, but this is less than the 84% from the Lux.Nat. 33 (21%) are against it, which is more than the 16% Lux.Nat.. The bilingual system is preferred by 27 (24%), and rejected by 82 (66%). Other schools are preferred by 41 (37%) with 67 (63%) against them.

In the category “Rest of the world” the distributions change once again. Out of a total of 42 respondents 20 (52%) are pro the current trilingual system, 20 (48%) are against. The bilingual system would be preferred by 19 (45%), but rejected by 23 (55%). Other schools are favored by 15 (37%), while 26 (63%) are against.

The rest of the world mainly is afraid of the challenges that come with the three languages to be learnt by the child and ideally by the parents.

84% of the Lux.Nat are pro trilingualism, whereas the percentage decreases to only 69% for ‘Luxembourg including all nationalities’, and a small majority of 52% pro trilingualism for the rest of the world.

On the other hand, the percentage in favor of bilingualism increases from a weak 16% pro bilingualism among Lux.Nat., to a 24% pro bilingualism among ‘Luxembourg including all nationalities’, and a strong 45% pro bilingualism for the rest of the world.

Taking the three categories together by summing them up, trilingualism is preferred by a total of 65% of all the respondents of this research, with 84% by Lux.Nat., 69% LuxAll, and 52% the rest of the world.

The other school’s option was equally chosen by the 3 categories: 36%, 37%, 37%, totaling up to 37% in the total batch of all respondents.

RESULTS – QUESTIONNAIRE’S OPEN QUESTIONS

Open questions aimed at providing deeper insights besides the above discussed categories 1) integration not separation of the population, 2) learn the three official languages of the country: L+D+F, 3) be prepared for the multilingual and multicultural reality in Luxembourg, 4) high failure rate given the fact that they do not understand the language of instruction especially in mathematics, biology, chemistry, history, and 5) pupils do not learn English well enough.

By keeping the three categories, 1) Lux.Nat., 2) Lux.All., 3) World, the open questions’ responses provided in-depth insight into serious reflections of directly concerned parents, whose children follow the Luxembourgish trilingual education system, or who consider doing so or who hypothesize in case of an eventual move to Luxembourg. Besides the above mentioned categories of advantages/opportunities and disadvantages/fears, here is what some of the respondents said:

Respondent from the category **Lux.Nat.**, who are **for** the trilingual system:

“I followed the Luxembourgish school system and today I am very happy to have done it (as my origins are Portuguese). I must admit that it was very hard: German lessons and some matters (biology / geography) were

given in German. I felt alone as nobody (my parents) could support me on a day to day basis with my homework. My child is in the Luxembourgish school system. I speak Luxembourgish, Portuguese and French with my own child..."

Respondent from the category **Lux.Nat.**, who are **against** the system:

"... The Luxembourgish education system is not the best, pupils don't have enough knowledge, following the PISA results, especially in sciences, biology, physics, chemistry, philosophy. They only learn these matters by heart without any generation of own ideas or any creativity. ... Motivation in general is low. ... School teachers lack knowledge themselves and teach frontally without any inspiration ... What misses at their language level is the mastering of one language. Pupils express themselves badly in written and orally in all languages. ... Pupils' only wish is to become school teacher or civil servant because of the fringe benefits. There is no real motivation, nor enthusiasm ..."

Respondent from the category **Lux.All.**, who are **for** the trilingual system:

"... It is an enormous chance for our children to be given the possibility of learning three languages. ... Knowing to speak three languages opens up their mind for other languages, cultures and knowledge ... Yet, we should teach better our teachers. ... Today my son speaks five languages, despite the initial problems with German, he had needed extra tutorial lessons ..."

Respondents from the category **Lux.All.**, who are **against** the trilingual system:

"... The requirements are too high. Strong pupils are able to follow, weaker not. ..."

"... Languages should be taught differently. French and German should be taught together from primary school on, and additionally offer extra tuition classes for weaker pupils. ... Luxembourger pupils have problems with French, whereas others with German. ... European School, International School, St. George ... are no public schools and therefore not for free ..."

"... The current system with the Luxembourgish language as the basis is not adapted to the open European world. The future of our children lies in the languages they speak ..."

Respondents from the category **'World'**, who are **for** the trilingual system:

"I think a trilingual system best prepares a child for the realities of Luxembourg and Europe. However, as a teacher, I would certainly think there would be issues switching from one language in primary to a second language in secondary. It would be better to study in German and French all the way through. My husband and I are both bilingual English and Spanish, however, we tend to speak mostly in English out of habit ..."
(Respondent from Canada)

"I personally think that sending our children to either trilingual or bilingual public education is a good idea, since the kids can share their different languages and family backgrounds. But English is still having the largest popular users all around the world. It is important in my own opinion that they should learn English ..."
(Respondent from Canada)

"I have no experience of life in Luxembourg but I believe that children should be taught in Luxembourgish, French and German in parallel along the whole education path, as it is a multicultural country and everyone might need to be fluent in the three languages. There could be an optional choice for a foreign language such as English or Spanish or more options even. Dividing students by language may split the country such as what is happening in Belgium. Taking India as another model, schools teach English and 2 or 3 other local languages at school ..." (Respondent from France)

Respondents from the category 'World', who are **against** the trilingual system:

"I think the current system is too complicated to be followed by a Chinese family, because we were taught English in China, so it is very difficult to learn 3 new languages, not only for the child but also for the parents. I just feel this is too complicated ... Hope someday I will have the opportunity to visit Luxembourg with my child to experience the education system of your country." (Respondent from China)

"As a Greek I am very sensitive about the language issue. Language is a significant element of the cultural and national identity of a nation; it is actually a mirror of the culture. Besides Maths and Chemistry education means also Literature and History and so ..." (Respondent from Greece)

"I would not like my children to follow Luxembourgish school system." (Respondent from Turkey)

"The instruction in Luxembourgish is unnecessary. This dialect needs to remain in the everyday use, but has not to enter school ..." (Respondent from Belgium)

"I would prefer the mother tongue which would be the formal language as well..." (Respondent from Greece)

RESULTS - INTERVIEWS

Among the 36 interview responses the main themes already mentioned and questioned above re-appeared. 1) integration not separation of the population, 2) learn the three official languages of the country: Luxembourgish, French, German, 3) be prepared for the multilingual and multicultural reality in Luxembourg, 4) high failure rate given the fact that children do not understand the language of instruction especially in mathematics, biology, chemistry, history, and 5) pupils do not learn English well enough. Other themes were discussed. The interview responses were categorized into the three categories: 1) Lux.Nat., 2) Lux.All. and 3) World and following if they are pro or contra the trilingual education system.

CONCLUSION, DISCUSSION AND IMPLICATION

This research has brought light to the particular elements of trilingualism in Luxembourg, in the particular cultural specificity following Hofstede et al. (2010). A huge majority respondents from Lux.Nat., Lux.All., and the rest of the world provided astonishingly similar answers. Trilingualism is part of the Luxembourgish constitution, namely Luxembourgish, French and German are the three official languages of the country. It is the characteristics of the country, it is its culture, its collective programming of their mind (Hofstede et al., 2010). While Cummins (2000) researches Canada's language situation - French-English - and García (2009, 2014) in the USA - Spanish-English – tends to translanguaging, Blackledge and Creese (2010) situate linguistic practices in their respective social, historical, cultural and political contexts, Brannen, Piekkari and Tietze (2014) combine language and management and Schinzel (2013a,b) uses language as identifier.

From the questionnaires, the written open questions and the interviews no significant differences in the results emerge. Only one question regarding preference of the system showed significant differences between Lux.Nat., Lux.All., and the rest of the world.

This research paths the way for more studies in the field of multilingualism and multiculturalism. In a world of increasing separation, conflict, crisis and war, the integrative, tolerant system of Luxembourg may serve as an example for peace, integration, tolerance, and harmonious coexistence. Further research could be the research among cross-border workers, by investigating their opinion on the trilingual public education system.

ABSTRACT

The management literature has recently given the increased attention to the topic of entrepreneurial activity and attitudes in different regions. New businesses and jobs creation contribute to the growth of economic. Together with the increasing migration flows it has been noticed the growing involvement of immigrants in the development of entrepreneurial businesses. In this paper we aim to link the entrepreneurial attitudes and activity at the regional level and migration, with emphasis on self-employment opportunities and the prevalence for immigrant entrepreneurs in different EU countries. This paper presents different indices of the regional entrepreneurship rankings, by focusing on the scores of entrepreneurial activity and attitudes in the context of migration flows. Comparative analysis of the variables of the EU countries is done. The study reveals in which countries immigrant entrepreneurs are the most common to develop their activities. Additionally, the study represents linkages between regional immigration and entrepreneurship. Based on empirical results further research directions are presented.

Keywords: *Regional entrepreneurship, entrepreneurial activity, attitudes, immigrant entrepreneurs, European regions.*

INTRODUCTION

Entrepreneurship has been identified as an important engine for the development of country or region, as well as substantial determinant for the growth of competitiveness and workplace creation, innovation and technology development and transfer. However, the extent and the magnitude of entrepreneurship influence vary across countries and regions (Szerb et al., 2013). There are several research focuses: at the individual and contextual level. Bosma and Schutjens (2007) highlighted the

importance of (cross-country) institutional factors and (interregional) demographic and economic attributes to variation in entrepreneurship. On the other hand, entrepreneurial activity and attitudes are highly dependent on the individual behavior of entrepreneur. Therefore, complex methodologies of regional entrepreneurship level assessment are often used to analyze separate indicators. The Global Entrepreneurship and Development Index (GEDI) methodology to measure regional entrepreneurship, and the Regional Entrepreneurship and Development Index (REDI) has been constructed for capturing the contextual features of entrepreneurship across the NUTS-2 level Spanish regions (Acs et al. 2011), as well Hungarian regions (Szerb et al., 2013). Global Entrepreneurship Monitor (GEM) is widely used to assess the national level of entrepreneurial activity.

The scientific problem of this research has been implied by the lack of the unified approach to the entrepreneurial features of the regions and their influence on (im)migration flow and link with immigrant entrepreneurship. Only few empirical studies on the topic of entrepreneurial regions have been conducted in Spain (Acs et al., 2011) and Hungary (Szerb et al., 2013). Kshetri (2014) analyzed how to develop successful entrepreneurial ecosystem in the context of Asian and Baltic „tigers“. It is important to note that migration usually serves as an indicator in different methodologies. However, recent scientific works have demonstrated a growing interest in immigrant entrepreneurship. The manifestation of immigrant entrepreneurship by analyzing the business development aspects has been studied by Carbonell et al. (2014); the relationship between the migration experience and risk perception has been highlighted by Hormiga and Bolívar-Cruz (2014). As Baycan-Levent and Nijkamp (2009) present, Central European countries including Germany, Switzerland, Austria, the Benelux countries, and France have been the most important immigration countries as well as traditionally the port of entry of many labor migrants in Europe. However, since the 1980s, the Southern European countries such as Italy, Greece, Spain, and Portugal have also become immigration countries, receiving people from Northern Africa, the Balkans, and the Eastern Mediterranean, mostly through illegal immigration due to the proximity to these regions, the geographical features.

In view of the research gaps identified, this study attempts to address the important research questions: what are differences in regions entrepreneurial features across countries? what opportunities for immigrants the entrepreneurial regions face? what are the connections between regions of entrepreneurship and immigration?

The purpose of this study is to investigate the link between regional entrepreneurial features and immigration flows across European countries. The research will cover regions' entrepreneurial factors, where presumptions of entrepreneurial activity by immigrants could appear. This study extends the

scientific discussion of immigrant flows relations with regional entrepreneurial features. Scientific literature analysis and statistical data analysis has been used for this study.

REGIONAL ENTREPRENEURSHIP, ENTREPRENEURIAL FEATURES AND THE ROLE OF IMMIGRANT

Measurement methodologies of the regional entrepreneurship

Over the last years entrepreneurship has been gaining increasing importance as a major driver for economic development, growth, competitiveness, employment and productivity growth (Braunerhjelm et al., 2009; Carree and Thurik, 2003). The rate of new businesses formation influences regional growth, forms industry composition, and contributes to regional disparities (Audrestch and Fritsch, 2002; Fritsch and Mueller, 2007). It is recognized that entrepreneurship is a complex phenomenon that is driven by individuals but embedded in a wider economic and societal context. That is to say, although actions by individuals drive the entrepreneurial process in regions, the wider regional context regulates the quality and outcomes of this process (Acs et al., 2013). Factors associated with regional variation in new firm formation at the regional level have been explored through studies of structural differences in geographical, industrial, and organizational variables (Kirchhoff et al., 2007; Woodward et al., 2006; Audrestch and Lehmann, 2005; Lee et al., 2004; Lay, 2003; Armington and Acs, 2002; Saxenian and Hsu, 2001). However, regions differ in terms of firm entrants, innovation and employment (Audrestch and Fritsch, 2002; Fritsch and Schmude, 2006). An entrepreneurial environment can be defined by habitat factors such as institutional and regulatory features, input and product market structures and the quality of human capital. Thus, regional entrepreneurship depends on a combination of several factors such as regulatory environment, natural advantages and resources, industrial and demographical characteristics of a region. Demographical characteristics of a region could also be called as an entrepreneurship capital. According Bönte et al., (2008), a region's entrepreneurship capital (REC) is initially dependent on individuals and their entrepreneurial intentions, interactions, and efficiency in exploiting new knowledge. Thus, REC includes all regional factors influencing an individual's decision to start a business, including the availability of resources needed to start a business and the regulatory environment.

While entrepreneurship as a complex phenomenon encompasses both the individual and contextual levels, the methodology of entrepreneurship measurement is a multidimensional process as well. There are several entrepreneurship measurement methodologies which have been widely used for decades:

- The Global Entrepreneurship and Development Index (GEDI) project came to alive to provide a suitable measure of entrepreneurship based on the multidimensional definition of

entrepreneurship and to present a useful platform for policy analysis and outreach. The distinguished features of GEDI are (1) the contextualization of individual level data by a country's institutional conditions; (2) the use of 14 context weighted measures of entrepreneurial attitudes, abilities and aspirations; (3) the recognition that different pillars combine to produce system-level performance; and (4) the consequent recognition that national entrepreneurial performance may be held back by bottleneck factors - i.e. poorly performing pillars that may constrain system performance (Acs et al. 2013).

- Global Entrepreneurship Monitor (GEM) research program is an annual assessment of the national level of entrepreneurial activity. Initiated in 1999 with 10 countries, it has progressively expanded its coverage and in 2014 conducted comparative assessments of entrepreneurial activity rates in 73 economies. GEM focuses on three main objectives: 1) To measure differences in entrepreneurial attitudes, activity and aspirations among economies; 2) To uncover factors determining the nature and level of national entrepreneurial activity; 3) To identify policy implications for enhancing entrepreneurship in an economy (GEM, 2015).

Entrepreneurial activities and attitudes and the link with migration

A system of entrepreneurship is the dynamic, institutionally embedded interaction between entrepreneurial attitudes and ability by individuals, which drives the allocation of resources through the creation and operation of new ventures (Acs et al., 2013). Thus, regional differences might be explained by analyzing entrepreneurial attitudes and activities. There are several phases of *entrepreneurial activities* such as nascent, baby business and established business (Bosma and Schutjens, 2007). The entrepreneurs' activities occur within a business context, which includes industry structures, competition, and national economic structures. Meanwhile, *entrepreneurial attitudes* at the individual level is captured by a combination of fear of failure, the perception of the start-up opportunities and having knowledge and skill to set up a new company.

By mapping indicators on entrepreneurial attitude and entrepreneurial activity it is possible to reveal the importance of (cross-country) institutional factors and (interregional) economic and demographic attributes to variation in entrepreneurship (Bosma and Schutjens, 2007). According to these authors *immigration* becomes one of the variables of entrepreneurial attitude and factor of the interregional differences. According Batista and Umblijs (2013) there are potential positive effects that migrants can have on host economies. First of all, migrants bring new skills (Ottaviano and Peri, 2012; Hunt, 2009), increase domestic demand and ease demographic pressures, furthermore, they often create jobs by engaging in entrepreneurial activities (Lacomba and Lagos, 2010). Evaluating entrepreneurial attitudes,

we can state, that majority of studies (Stewart and Roth, 2001; Ekelund et al., 2005), are focusing on the role that risk preferences play in the decision to be self-employed. For example, in the context of migration, the findings by Clark and Drinkwater (1998) (cited by Constant and Zimmermann, 2006) suggest that self-employment is a way out of discrimination in paid-employment for immigrants in the United Kingdom.

Immigrants entrepreneurs
